THE PRIVATELY ENDOWED MEDICAL SCHOOLS

Their Present and Future Financing

ALAN VALENTINE, LL.D.
President, The University of Rochester
Rochester, N. Y.

Americans are used to crises. They have survived several in recent years. But because in a democracy national action depends on mass understanding, we attack our crises almost too late. This is particularly true when the issue develops slowly and insidiously. It is easier for the nation to unite in the face of a dramatic Pearl Harbor or a polio epidemic than before an emergency in national health.

How can there be an emergency in national health? Judged by business standards the members of the medical profession should be in a prosperous state, for their services were never in higher esteem, greater demand, expanding more rapidly or paid more highly. Yet such a crisis exists.

Part of it centers in the high and increasing cost of medical care to the patient. That is a great problem, as yet unsolved. But we recognize its existence, and we approach solutions—though not as rapidly and courageously as we should. That issue concerns all of us, but its solution will not really meet another part of the emergency—the one which is my subject today.

That crisis lies in the training of physicians to provide medical care for the people of our nation. That training in proper quality and numbers depends on the prosperity and quality of American medical schools. Financially their situation is desperate.

STATEMENT OF NINETEEN UNIVERSITY PRESIDENTS

Desperate is a strong word, but its use has good authority. Nineteen presidents of universities with leading medical schools said in a joint statement issued last March:

> The present provisions for ensuring a continuing supply of well-trained physicians are inadequate. They are inadequate because the medical schools which provide that supply are inadequately supported in terms of future needs. Few if any of the seventy recognized medical schools in the United States can be confident, with present resources, of maintaining in the future their programs at the essential high level.
>
> Over the past fifteen years private support of medical education has not been regularly maintained. Three or four medical schools came perilously near to closing during that period. Many medical schools were forced to abolish certain teaching positions; to reduce teachers' salaries and important medical services; to restrict promising research; to make very heavy demands upon the time and energy of doctors, nurses and hospital staff; and to forego normal growth and improvement.

What have been the results? I offer a few illustrative examples. "Although our battle casualties were thirty to forty per cent psychiatric in World War II, there are not five medical schools in the United States with departments of psychiatry adequately endowed." "There is hardly an exemplary department of dermatology in the country." "Industrial medicine, preventive medicine and medical sociology remain undeveloped for lack of funds and trained experts. The organization and development of pharmacological teaching languishes for lack of support, and tropical medicine, so obvious to our recent and future responsibilities, remains relatively unexplored."

These are matters of quality and content, but there is also a grave question of quantity. Conservative estimates, based on present demands, place the number of physicians required by 1960 as about 225,000. At present rates of output, retirement and death, only 210,000 physicians will be available at that time.

The nineteen university presidents concluded:

> Unless existing conditions are quickly changed, medical education will decline in quality, and medical research will falter. . . . We warn our fellow citizens that without their prompt and generous aid our medical schools, through their graduates, cannot be expected to safeguard the future of American citizens and their children.

That statement was almost out of date when it was written, and is wholly inadequate now, so rapidly have costs risen in the last two years. It is no longer a question of funds to expand medical schools, but of finding funds to maintain them as going concerns. Before expansion must come needed financial provision to enable medical schools to maintain their present quality and numbers.

Our medical schools are attached to our universities. If universities are hampered by lack of funds, then their medical schools suffer. Let us therefore glance at the position of universities in 1948.

POSITION OF UNIVERSITIES IN 1948

In 1946-1947 university students were paying 26 per cent, and the government, on account of veterans, 30 per cent of total expenditures (United States Office of Education 1946-1947). Most of the balance in private institutions is met from endowment income, which has decreased. If enrollments remain at present levels and government funds are withdrawn as veterans' education rights come to an end, higher education will be short by an additional 30 per cent the amount needed to meet total expenditures. But this is only another straw on the back of an overburdened camel. "G. I. Bill of Rights" tuition payments to higher education have not paid the full cost of instruction of veterans. They merely created a new problem, and their cessation will create another one. Beneath those problems lies the basic one that revenue is inadequate to need.

Estimates of the additional income which higher education requires above its pre-war needs run as high as 200 per cent (Seymour Harris). It is true that endowments have increased over the past twenty years, but those increases are misleading. At face value they seem notable additions, sufficient to provide added income for the expansion and improvement of higher edu-

cation. But increased costs, lower rates of income on investments and the decreased purchasing power of the dollar offset, and sometimes more than offset, these additions to capital.

The situation of Harvard, America's richest university, is typical. Between 1928-1929 and 1945-1946, Harvard's endowment increased $68,000,000, or about 66 per cent. Yet the goods value of its income from endowment in 1946 was no greater than the goods value of its endowment in 1928-1929, and in addition Harvard's endowment in dollars—depreciated dollars—per student in 1946 is only 66 per cent of the endowment per student in 1928.

EFFECT ON MEDICAL SCHOOLS OF WEAKENED UNIVERSITY FINANCES

The effect of weakened university finances is already painfully felt in their medical schools, since medical schools are not adequately endowed and must depend on general university funds. As Dean W. C. Davison of Duke University Medical School stated in his 1947 report:

> All medical schools are having difficulty in providing the bare necessities for adequate instruction and for the training of personnel. The present salaries of instructors, nurses, technicians and secretaries are not meeting the increased cost of living.

A highly authoritative survey as yet unpublished and therefore confidential in source reports: "More than 25 medical schools need assistance to reach accepted minimum costs of adequate operation."

Even the federal government has come to recognize the situation. The report of the President's Scientific Research Board, headed by John R. Steelman, dated October 1947, states:

> Most medical schools, especially those without State funds, are facing the prospect of reducing their training programs, or even—in a few instances—of closing altogether. Expansion is out of the question, unless substantial support is forthcoming . . . at a time when expansion of both (training and research) is vitally needed. An even more acute financial need exists in the graduate schools for basic sciences. Thus the training grounds for medical investigators—the very roots of medical progress are threatened.

In considering this problem it is important to distinguish between medical care and medical education. The two are of course inseparable and mutually dependent, but they are different functions, and adequate support for one does not necessarily mean adequate support for the other. In the case of medical care, the chief problem is to reduce its cost to the average patient. But the cost of medical education cannot be appreciably reduced if quality of training is to be maintained. Indeed, that cost is likely to mount still higher, as each year adds to the scientific knowledge which a medical student must acquire. The solution in medical education is not primarily to reduce costs but to acquire funds to meet almost irreducible costs. A reduction in costs of care to patients and a reduction in costs of hospital operation would help the cause of medical education, but would not in themselves greatly reduce costs of medical instruction.

But at this point it is pertinent to suggest that medical schools should promptly study every one of their functions to discover whether instructional costs may be reduced without loss of quality. The New York Academy of Medicine recently pointed out that "there has been no fundamental reorganization of American medical education since 1910."

Such a study should be made, though I doubt that its results would produce economies. I have observed that every time a faculty studies its program, it emerges with a new program at higher cost. But the study might show how teaching efficiency could be improved. Certain traditional functions and methods might be found to have lost their original values if scrutinized in the cold realism of 1948.

Those medical schools which do not live on tax money are in the most difficult position. The iconoclast might ask: "Why not let private medical schools die of starvation and depend on the tax-supported schools? Why is the continued prosperity of private medical schools important?"

PRIVATE SCHOOLS LEADERS IN MEDICAL EDUCATION AND RESEARCH

The answer lies in the record. The private schools have been, and still are, the leaders in medical education and medical research. Their independence of state control has been an important factor contributing to their leadership. Without them the state university medical schools themselves would suffer, but the medical profession and the public would suffer even more.

Of the total crop of M.D. degrees conferred between 1930 and 1940, between 60 and 66 per cent came from privately endowed institutions. Of students currently enrolled in accredited medical schools between 60 and 66 per cent are in private medical schools.

So much for the past and current contribution of the private schools to the production of physicians. How great is their contribution to medical research? Recently I asked two medical authorities this question: "Approximately what part of the distinguished advances in medical research over the past decade have come from graduates of privately endowed medical schools?"

Dr. Alan Gregg and Dr. Willard Rappeleye, reporting separately, agreed that 80 per cent of our significant advances in research have come from graduates of private medical schools. This record is an adequate answer to those who would let the private medical schools decline.

In presenting the importance of private medical schools I do not lack appreciation of the state-supported medical schools. Some of them have demonstrated that an educational institution can receive large public funds and still maintain high qualitative performance and freedom from political interference. But I remind you of the topic assigned to me—the privately endowed medical schools.

HOW MUCH IS NEEDED

Accepting the need for greater funds, how much is needed? This is not a question easy to answer, since universities have difficulty in separating clearly the cost of actual instruction from the cost of their teaching hospitals and the cost of their research, and no one can say with certainty exactly what part of the cost of a teaching hospital, or of the cost of research, should be assigned to medical schools as absolutely essential to medical education. But one can offer estimates.

The budgets of the seventy-seven medical and basic science schools for the academic year 1947-1948 exceed $43,000,000, and, generally speaking, this figure does not include costs of patient care in teaching hospitals, or plant maintenance, or general university administration, or research grants from foundations, industries and governments. Therefore the figure is too low, but let us accept it for working purposes.

Of that amount student fees provide less than $12,000,000, or 28 per cent, and expenditure per student per year ranges from under $2,000 to over $5,000. The remaining 72 per cent must be derived from other sources.

Research grants from external sources, though large and usually of educational value, do little or nothing to relieve the actual costs of medical instruction.

In its study entitled "Medical Education and the Changing Order" (1946), the New York Academy of Medicine stated that "the medical schools of this coun[illegible] need to double their budgets for teaching and research by 1960." No authority that I have consulted thinks that estimate excessive. All things considered, I believe that medical schools now need about $40,000,000 more per year. This is less than the amount estimated by the New York Academy, but I believe that our schools need that amount now. They cannot wait until 1960.

How much is $40,000,000? It is about 1/6,000 of our gross national income. It is about 1/1,000 of the federal budget which Mr. Truman has asked for 1948. It is 1/5 of what Americans spend annually on vitamin pills, often to no advantage whatever. It is less than 4 per cent of what Americans spent on jewelry in 1946; it is less than 1 per cent of what Americans spent on recreation in 1942, and less than the receipts from forty-five horse racing tracks in 1939. Nationally speaking, it is pin money.

If this $40,000,000 were all capitalized into endowment yielding 4 per cent, the needed endowment would be $1,000,000,000, still only 1/40 of our proposed federal budget for 1948. But since the $40,000,000 estimate includes the budgetary needs of the state-supported medical schools, which operate primarily on tax money, the billion for endowment can be reduced accordingly. The state schools turn out between 34 and 40 per cent of the annual crop of M.D. degrees. Reduce the $1,000,000,000 for endowment by 34 per cent and $660,000,000 is left, which compares with the $689,000,000 separately arrived at by Dr. Donald G. Anderson, Secretary of the Council on Medical Education and Hospitals of the American Medical Association, as the endowment now estimated as needed by the private medical schools. The two figures are so close that one can accept them and say $680,000,000.

So private medical education needs either $680,000,000 for endowment or some $30,000,000 annually. Endowment is preferable, but because of the large amount needed one should look to annual gifts to supplement whatever endowment can be secured. If these are the necessary goals, how can one reach them?

PRIVATE SOURCES OF FUNDS

Speculation on the sources of further income is a familiar game to university people. It is easier to list the possibilities than to make them reality. First consider the chances of large additions to medical school endowments.

The present endowments possessed by medical education have come chiefly from two sources. One of those was large gifts from philanthropic foundations interested in medical education. The hope of further large additions from this source is remote. Few if any foundations now favor the policy of making large gifts from capital sums, and thus in a few years distributing their assets and ending their usefulness. And the total income available from all such foundations probably does not exceed $4,000,000 per year, less than 1 per cent of needed endowment and only 10 per cent of the annual need of medical schools. Foundations are probably wise in devoting most of this income to the temporary stimulation of unusually promising or pressing research problems. They must be eliminated as major contributors to the future cost of medical education.

The second source of medical endowments has been multimillionaires. Few still exist, and unless our tax structure alters, fewer will exist in the future. But to despair of further large gifts from private persons is to give way to excessive pessimism. Occasional gifts and bequests of several millions of dollars are still coming to universities, and there are still more multimillionaires than is generally known. But they must be found; they must be reached; they must be educated to giving largely to medical education. To do this, the entire medical profession as well as university officers must be constantly alert and energetic. If they are, large private gifts can provide much of the needed endowment, and/or much of the needed annual budget. And a change in tax laws, making them more favorable to the acquisition of fortunes and to the gift or bequest of large sums to education, could greatly enhance aid from this source. Every one of us should work to get our tax laws altered —not simply to make the rich richer, but to permit the accumulation of private funds for future gifts to education and to increase incentive for such gifts.

A second way to increase endowments is by large numbers of small gifts. This is a device increasingly visualized and adopted as the large fortunes have declined. It is effective only after a thorough campaign of public education. Such educational campaigns are expensive in time, energy and dollars, and to be effective must be continuous. As a method of fund raising, the small gift program is comparatively inefficient, but it has the advantage of compelling a campaign of public education, and education of the public to the needs of medicine is absolutely essential.

To inform and convince all middle class American citizens of the needs of medical education will not be an easy or rapid achievement. I suggest that it could be done by an organized and continuous campaign on a national scale. In that campaign all the leading forces of medical education and medical care should join in closely knit unity of objective and action. Otherwise the results will be trivial as compared with the need. But the possibilities are unlimited, as a few examples will indicate. I cite them for your encouragement.

In the period 1932 to 1944, in which national income ("gross national product") rose from $60,000,000,000 to $240,000,000,000, or 400 per cent, the rise in the amount spent by individuals of the nation on higher education was trivial. The money went somewhere else. It did not all go to meet taxes or the added cost of living; part of it went for luxuries or for what used to be considered luxuries.

In 1932 the public was left with $40,000,000,000 after taxes. In 1947 it was left with about $180,000,000,000 after taxes, an increase of 450 per cent. The public spends $110,000,000,000 more on consumption goods now than in 1932. Over the past fifteen years personal consumption expenditures for nondurable goods rose from $20,000,000,000 to over $100,000,000,000, increasing over 500 per cent. Personal income rose from $48,000,000,000 to $200,000,000,000, increasing over 400 per cent.

According to a report quoted in the latest report of the President's Commission, philanthropic contributions for the ten year period 1930 to 1939 amounted to an average of less than 2 per cent of the income reported by individuals on federal tax returns for that period. If this average had been 5 per cent, or only one third of the 15 per cent exemption permitted, about $6,000,000,000 of additional funds would have come to educational institutions and other philanthropies. Had the full 15 per cent exemption been utilized, the additions to philanthropies would therefore presumably have been $26,000,000,000.

These figures would indicate that there is in private pockets more than enough to finance painlessly the added costs of medical education. Professor Seymour E. Harris of Harvard concluded that education is not receiving an adequate share of the nation's annual flow of resources or disbursements. The reason, I believe, is that the education-loving American nation is not really aware of the need.

What of other sources of funds, annually or for endowment? Direct support for medical education cannot be hoped for through community chests. Such aid as community chests can give to medicine is more properly directed to support of hospitals, which need all the aid that community chests can possibly provide.

It is now the fashion of all those who wish to raise funds to turn to industry. American business has been most helpful to medical research, and will be equally helpful in the future. But there are limitations on the type of aid which business can give to medical education. Its obligations to stockholders rarely make direct gifts to medical education proper The normal procedure is to aid research. Though helpful, such grants relieve little if at all the regular budgetary costs of medical instruction. Grants are usually limited to one or a few years, raising problems of staff appointment and security, and forcing sudden abandonment of research. Much of the research currently financed by business is applied rather than basic in nature. Medical education should cultivate the friendship and further support of American business and industry; it must educate business friends to the importance to them of fundamental research and of long term grants to the greatest extent circumstances will permit. Business can greatly help medical schools, but it cannot be a major direct factor in meeting the added costs of medical education.

GOVERNMENT SUBSIDIES

There is serious talk of government subsidies to help medical education. I believe that such subsidies are inevitable, since even if medical education is wholly successful in securing needed support from private sources, it cannot be wholly successful in time to save our medical schools from further deterioration. Not all educators regard government subsidy as the proper solution, and indeed government support has great potential dangers to higher education. But the present issue in medical education is not whether to accept government aid, but to work out terms by which government aid can be provided without permanent ill effects. It behooves us to work quickly and affirmatively with government to formulate those terms. This subject cannot be adequately treated in this paper, but neither can it be ignored.

The best form of government aid would appear to be through federal grants, whether or not routed through the states. Both the policies and the administration of such federal grants should be wholly in the hands of a nonpolitical, national commission of private scientists and lay citizens, appointed by and responsible directly to the President. Valuable precedents, with appropriate adjustments, exist in the National Academy of Sciences, in the proposed National Science Foundation and, best of all, in the methods by which the British government supports higher and medical education, without regimentation or political nepotism.

The best forms of aid which government could supply to medical education appear to be (1) emergency grants-in-aid, on some standard formula and without strings, directly to approved medical and related schools; (2) grants to aid in the construction of added physical facilities, with necessary equipment, to improve teaching facilities, strengthen research programs and (only when existing programs have been saved) to provide for more medical students on a high qualitative level, and (3) most important of all as a long term program, a system of federal scholarships for students of medicine, generous in amount and awarded wholly on a nonpolitical, nongeographic and nonracial basis, perhaps with some commitment on the part of the scholarship holder to serve for not less than a stated period with either the medical services of the government or in the medical schools of the nation.

One difficulty would be to determine and agree on the actual total cost to a university of the education of one of its medical students. A formula which included only total teaching and salary budgets and actual cost of supplies used by students would be absurdly unrealistic. What proportion of the annual deficit of a teaching hospital should be charged against medical education? What proportion of the total cost of research in medical schools should be charged against medical education? What part of the annual deficit of the outpatient department? What part of university administrative overhead and hospital and plant operating costs, etc., are justifiably included in figuring the actual instructional cost per student? A realistic decision might make even present top estimates per year seem puny. Possibly such a formula could be found, and agreed on, permitting government grants-in-aid on a student cost basis. The fact that the Navy and the universities agreed on a formula for overhead, and applied it, offers some hope.

But even as we study the need for government aid, and proper terms for its acceptance, let us remember that to the greatest extent possible government aid should be only a supplement to increased support from private sources. Large funds, available for endowment or annual giving, still lie in private hands. The primary and long term objective of private medical schools should be to secure private funds, as promptly and as largely as possible. We must act with private enterprise on private enterprise. We can reach the goal if and only if the entire medical profession makes the effort with unity, with energy, with continuity. In that effort lies the safest future and freest progress of medical education and medical care.

ABSTRACT OF DISCUSSION

DR. BENNETT H BRANSCOMB (Vanderbilt University): As a layman I feel a hesitancy in speaking to this professional body. The essential problem seems clear however to all of us We have built up in the last quarter century the most highly developed system of medical research and medical instruction known anywhere. The leadership in that development has been carried by a number of privately endowed institutions. For fifteen years we have had vast social and political changes which have curtailed the creation of new fortunes and have made it necessary for individuals of means who wish to contribute to education to pay for the privilege of doing so. The result has been that the source of support for these institutions which have been in the forefront of this amazing medical development has been greatly reduced. This is the essential problem: What shall we do about it? The idea of letting medical education be taken over by state schools would be socially wasteful. There are values in the independent medical schools which can serve society which might not be shared to their full extent by the state school. While the public would not agree to any solution which said, "Close up these private medical schools," this is progressively taking place. That process will continue. We will simply close down gradually and try to do the job adequately with the funds which we have at our command, unless this problem can be solved in some fundamental way.

There are four lines of solution The first of these is to distinguish between medical care and medical education, particularly as it applies to our teaching hospitals. The public is convinced that it ought not call on teaching institutions to provide medical care for the indigents of our cities and states. The time is now ripe to transfer that cost to the proper governing bodies of our states and cities and counties. Eighty per cent of the cost of carrying 200 indigent patients per year at present costs will run between $500,000 and $600,000 a year. The obvious solution then is, to be perfectly frank, that that charge must be carried by other agencies, and the teaching institutions have no obligation to render that particular service. We must teach people to understand that in these teaching hospitals every patient, private and otherwise, must be available for teaching purposes

The inducement we are going to make is that these teaching hospitals will provide so much better medical care that private patients will be glad to pay to come in, in order to secure this service and make themselves available for teaching purposes.

We must publicize to a far greater degree than we have done the plight of the private medical school. If the public wants it, it must support it I need only refer to the enormous contributions given in recent years for research work, to show how the public responds when it understands what the essential problem is. The fourth avenue of possible support is support by the federal government The medical schools which have depended on private support are facing a serious crisis. We have every right to look to the federal government, both from the standpoint of the great service and the record of these schools, and from the standpoint of the responsibility of government for this crisis to give emergency support to the medical schools Two consequences I think will follow from a program of federal support of private medical schools·

The first is that if the public recognizes that the federal government is supporting the schools of medicine, it will, to an increasing degree, insist upon more and more control of medical practice The usual view advanced is that the government will insist upon controlling the medical school A program of federal support is going to further efforts to control the total medical program of medical care as well as of education There is a second dangerous result I am afraid of the effect on the schools—not only that they will be reduced to a sort of dead level of uniformity, but that much of the sense of initiative and development which have characterized these schools will tend to disappear The temptation will be to wait for federal agencies to put the funds out to start new departments and new services

Dr. Joseph Hinsey: All medical schools are experiencing great difficulty in finding funds for the adequate training of physicians Just when demands for medical care and public health are unprecedented and steadily mounting, the quality of medical education is in danger of deteriorating for lack of sufficient income The present salaries of teachers, nurses, technicians and other personnel do not meet the increased cost of living Teaching is handicapped for lack of adequate equipment and space. Many otherwise qualified students are today unable to pay the high costs of their medical education Since the maintenance, let alone the advancement, of the medical welfare of our people depends on the production of adequate numbers of well trained physicians and research workers, the under-financing of medical schools is a problem of national moment Funds for medical research are available in amounts greatly in excess of those provided before the war, although much greater support is needed for continuing national security and progress. The best utilization of such research funds is impossible today owing to the shortage of scientific personnel and the limited physical facilities of many medical schools. In the United States, medical schools have been financed in four ways· private endowment, private gifts, tuition fees and taxes. Income from endowment and private sources has steadily decreased Tuition fees, which paid 70 per cent of the cost of medical education in 1910, now pay less than 30 per cent of such cost; yet tuition fees are already so high that many capable students are debarred from studying medicine. It is to public support, then, that medical schools must turn. Only public appreciation of the financial plight of our medical schools, and public help in providing for their support, can prevent serious deterioration in the health and well-being of our people.

Dr Harold Lueth: I would like to mention that there are twenty-seven schools which are supported by tax funds through states or municipalities, and they present a little different picture than the one just presented and some notice should be given to them. For the same reasons enunciated, state-supported schools like private schools find tuition fees cannot be raised. Endowment or gift funds, while they have been successful in some state institutions, have the disadvantage that they may dissuade the legislature from appropriating as much money in succeeding years, so there is an end point to the possibility of gaining funds from those sources. The more difficult problem of whether or not the state endowed schools should enter the practice of medicine is such a complex one that I will just mention it. In general, funds for state or municipal schools come through general legislative action. The whole financial picture in the state-supported school is not quite the lush and verdant pasture that some of the earlier speakers indicated. Research, of course, is being conducted in tax-supported institutions, and we are grateful to the privately endowed institutions for their advances in organization and leadership in those areas. It is believed, however, that state-supported schools have a certain contribution to make; namely, they can show the privately endowed schools how public money can be used, and how academic freedom can also be retained. Lastly, the most important thing is to conduct the widest possible educational or public awareness program to let everybody know the many financial problems not only of the privately endowed but of the state-supported school.

MEDICAL EDUCATION IN GERMANY AND AUSTRIA

IRVING S WRIGHT, M.D.[*]
New York

The state of medical education, as it exists in Germany and Austria today, may appear to have only a remote relation to the health of other portions of the world, and in particular to the problems of medical care in the United States. A moderate degree of reflection, however, will clearly demonstrate that the health of any large nation in the center of the continent reflects quickly on the health of all surrounding countries. Furthermore, those who have been familiar with the problems of medical licensure of foreign physicians during the past two decades will anticipate that this experience will be repeated as soon as it is possible for physicians of Germany and Austria to migrate to the United States. Inevitably, pressure will be brought to bear on the various licensure bodies to pass on the qualifications of the graduates of the German and Austrian medical schools, in order that they may be permitted to practice in this country on an equal basis with the graduates of the American medical colleges It is vitally important, therefore, that the responsible bodies, including this Congress on Medical Education and Licensure, concern themselves with continuing

---

Civilian Consultant in Medicine to the Surgeon General of the United States Army.

Based on a survey conducted with Dr. Edmund Horgan under the auspicies of the Surgeon General of the United States Army.

Read before the Forty-Fourth Annual Congress on Medical Education and Licensure, Chicago, Feb 10 1948 surveys of the status of the European medical schools in order to evaluate properly the physicians applying for licenses from them. The condition of these schools as of 1948 cannot be as accurately analyzed five or ten years hence, at the time these physicians will make their applications. Careful records should be compiled, recording the state of the educational program of each European medical school during each of the war years and the years thereafter. It will be made clear from my discussion that there is a considerably discrepancy between the potentialities for medical education among the various medical schools of Germany and of Austria today, and this will be perpetuated until such a time as they are all in better position from the point of view of *materiel* and faculty. It now appears that this improvement will be slow to occur, and in some instances the universities may never achieve their former stature.

There are five major facets essential to medical education: a well trained faculty; suitable buildings for the preclinical and clinical teaching, including hospital facilities; adequate supplies and equipment for the laboratories necessary to the training of the students and the carrying on of research; a patient volume load of sufficient size and variety to permit experience in a large number of diseases, and a well selected student body. All are vital. The faculty and the carefully chosen student body are the most important. Today, in Germany and Austria, the clinical material is the only ingredient which may be considered as adequate.

FACULTIES

The faculties of the German medical schools suffered during the Nazi regime from a systematic Nazification program. As a result of this, practically all Jewish teachers and many other teachers of distinction who dared to differ with the Nazi philosophy were removed from their posts, and in most instances went to concentration camps, not to return. This served greatly to deplete the university faculties. At the same time, a policy was established whereby a Nazi party member was placed in the faculty of each school, whose functions were to see that the remaining members did not deviate from the party line and that all new members of the faculty appointed had demonstrated strong Nazi sympathies. This resulted in most of the medical schools being solidly Nazified. Immediately after the cessation of hostilities, the Allied Military Government started a thorough system of de-Nazification. At first, all teachers who were known to be Nazi sympathizers were removed from the faculties, but later a more stringent ruling was passed which made it necessary for all who remained on the faculties to demonstrate that they had never in any way indicated their sympathy to the Nazi party. Those who could not fulfil this requirement were, for the most part, sent to concentration camps. Since, during the tensions of the past fifteen years, it was practically impossible for an intellectually active person to refrain from some expression of opinion one way or the other, the complete disintegration of the faculties of the medical schools was inevitable. At Tubingen, for example, there were only two members of the medical faculty who survived the double purging. At Frankfurt, one third of the faculty had been dismissed before the close of the war as anti-Nazi, and when this was combined with de-Nazification, few professors were left. Until recently, six full chairs of the medical faculty were vacant. The Munich medical faculty lost seven professors out of a total of sixteen. Some of the teachers in the medical schools were still not officially cleared at the time of our visit in September and October 1947, but, for the most part, the ones who remained were acceptable to the Allied Military Government.

As a result of the years of poor teaching, during the Nazi regime, there are few younger men capable of occupying the chairs which are vacant. In other words, there is no younger generation to step into the positions of teaching responsibility. Scattered throughout this rather desolate picture are a few strong characters who survived the various vicissitudes of purges, concentration camps and other indignities and who are attempting to lead their respective universities out of the morass into which they have fallen. Notable among these are Sauerbruch, Professor of Surgery at the Charite Krankenhaus of the University of Berlin, who, though in the Russian sector, has been able to maintain a relationship with the British and Americans and who is continuing in his position of leadership. Professor Brugsch, of Medicine, is also Vice Chancellor of the University of Berlin and is making a noteworthy contribution in this regard. At Frankfurt, Professor Volhard, now 78 years old, has been restored to his chair from which the Nazis removed him, and he is still an outstanding teacher of medicine. The University of Munich has been greatly damaged, in respect both to faculty and to equipment. Professors Beingold, Frey and von Seuffert are attempting a reconstruction program. At the Kaiser Wilhelm Institute, Professors Schultz and Singer are still noteworthy. Of the schools visited, the University of Heidelberg appears to have maintained its status best. Heidelberg was declared a free city early in the war and never suffered from bombing. Because of a strong and stable faculty led by Professor Bauer, Professor of Surgery, the faculty was never seriously depleted by the Nazis or Allied Government. Today it remains as the outstanding medical school in Germany, the second probably being the University of Würzburg, which likewise did not suffer seriously from bombing, although the town of Würzburg was virtually destroyed.

In Austria, the situation is somewhat different, most of the faculty having weathered the vicissitudes of the various regimes. Thus, there are Professor Wiethe, dean of the medical school, an otologist, Professor Kauders in neuropsychiatry, Professors Schoenbauer, Finsterer and Denk in surgery, Professors Lauda and Fellinger in medicine, Professors Artz and Wieldmann in dermatology, Antoine in gynecology and Chiari, who is outstanding in pathology.

These and other men of stature in Germany and Austria are attempting to gather about themselves groups of young disciples who may in another eight or ten years or more develop into adequate teachers, although their basic education has been of a poor order.

THE BUILDINGS

Even such leaders as those mentioned previously may be handicapped to the point where their work is largely ineffectual if they do not have adequate laboratories and hospital facilities. The effect of bombing on most of the German medical schools and university hospitals was appalling. When Hans Reis, who made a survey immediately after the war, reached the University of Kiel, for example, there was not a single person available for questioning or discussion in the bombed-out buildings once used for preclinical studies, collection of specimens and teaching purposes. At the University of Munich, the medical school was largely destroyed. The anatomy, physiology, physiochemistry, hygiene and bacteriology, botany, zoology and chemistry institutes were practically incapacitated. The surgical and the first and second medical clinics were only shambles. The eye, dental and outpatient clinics were severely damaged. Less harm was done to the obstetrics, gynecology, neuropsychiatry and dermato urology clinics. Even two years later, at the time of our visit, major portions of the medical school remained heaps of rubble, and the surgical clinics were far from rebuilt. Large numbers of students crowded about in totally inadequate facilities, and relatively little active rebuilding was in process.

At Frankfurt, the anatomy, hygiene, pathology, pharmacology, physiology and surgical sections were severely damaged. The Orthopedic Hospital, which originally had seven hundred beds and an outpatient clinic, was completely demolished. One wing of the Psychiatric Hospital was destroyed completely, with all records pertaining to the effects of bombing on psychiatric conditions. The library of the City University Hospital was destroyed. A subterranean air raid hospital had been built on the grounds of the medical center, and it did permit operation of many hospital functions during air attacks, but the medical school had ceased to function from February 1945 until after cessation of hostilities. A similar report could be given in reference to most of the universities. The University of Vienna's buildings in contrast were sufficiently intact so that work could progress in a fairly normal manner.

EQUIPMENT

The lack of equipment was one of the most disabling factors interfering with the conduction of proper medical care and teaching. In most of the schools, the laboratory equipment had been completely destroyed, especially all glassware, and much of value in the way of fine balances, and so forth, had disappeared in the course of various raids and periods of disorganization.

The x-ray equipment at most universities was reduced to a meager basis. Most of it had been damaged or had worn out. The most critical item, however, was tubes. According to the statements made to us, no new x-ray tubes have been manufactured in Germany since the war ended. This was the result of the fact that the raw materials, the workers and the factories were in separate zones, and could not be brought together for their production. There is no money with which to buy x-ray tubes from outside sources. Therefore, as they wear out, the situation becomes increasingly acute, and many hospitals are now using their last tubes.

Chemical supplies are at a premium. It is perhaps symbolic of the high degree of destruction of scientific civilization when one finds that at the University of Munich, long famed for its fine chemical research, the determination of blood sugar studies is frequently impossible because of inadequate chemicals necessary for this simple test.

From the point of view of the treatment of patients, many of the simple necessities are missing. Soap was at a premium, and some hospitals are almost without it. This became an acute problem during the epidemic of infantile paralysis in Berlin. Many surgeons have had to return to bare-handed surgery because of lack of rubber gloves, and such distinguished surgeons as Schoenbauer showed us gloves which they were using, patched many times. Rubber tubing for enema and catheter use is extremely difficult to obtain.

There is no penicillin available to the German hospitals; there is no streptomycin. Some sulfonamide drugs are available. The absence of these and other modern therapeutic agents makes it impossible for the German physicians or students to have any training in modern therapy. Indeed, they are still very skeptical regarding the effects of penicillin, especially in the treatment of subacute bacterial endocarditis.

PATIENTS

The one item necessary for medical education which is present in great plethora is volume of patients. Never have the demands been greater or the facilities for care poorer. The strain of the war years, followed by the malnutrition of the postwar years, together with the extremely poor sanitary and health conditions, has magnified the incidence of all types of infectious diseases to a high degree. The facilities for the handling of these patients are hopelessly inadequate, and many of them must remain in their crowded homes, even though they are severely ill with tuberculosis, typhoid and other diseases which are highly dangerous to the population at large.

STUDENTS

The situation as has been outlined clearly indicates that it would be possible to train only a few students even moderately well. The actual facts are, however, that the student bodies of the university medical schools are larger than they have ever been in the history of German medicine. Approximately 50 per cent of all students registered in the German and Austrian universities are registered in the medical schools. This is the result of several factors. One is that in times of turbulence such as Europe has been through, and still faces, the degree of medicine has maintained some essence of stability and dignity. It has, furthermore, frequently been a key of some sort which permits its possessor to enter foreign countries. It enables him to support himself in these foreign lands. Another factor of considerable importance is that, under the totally socialized medical regimes of the countries being discussed, the appointments to the medical school student bodies are made by political boards. In most medical schools, the faculty has nothing to say about the selection of students. In certain sections, as in greater Hesse, the selection is somewhat more careful than in others, but even here it is not conducted by the faculties of the medical schools. Furthermore, after students are admitted, they may continue to attend the medical school classes for as long as two years before they have to take their first examinations; this, whether they are suitably qualified or not. Discussion with members of the faculties in both Germany and Austria indicated that there was great dissatisfaction with this situation among the teachers but that they were unable to successfully combat it. Appointment on a political basis has resulted in tremendous overcrowding. For example, in Vienna there were 3 500 medical students out of a total student body of 7,000. It was reported that at Munich there were 4,000 registered in the medical school, with 3,000 on the waiting list. Most of the other schools had from 1,800 to 3,000 medical students. Only the smaller ones had as few as 1,200. Inquiry indicated that the faculty members were inclined to believe that all of these students who so elected would eventually graduate. They have several opportunities to pass each set of examinations without being eliminated from medical school. They may take as long as eight or more years to complete their courses, which is not new in these countries, but it was anticipated that most of them would receive their degrees. As an additional inducement for attending the medical schools, in a number of areas medical students receive extra rations. When the population is on a legal ration limit of 1,500 calories, this is an inducement of no mean proportion, and, I might add, has little to do with whether the student is suitable for or interested in the profession of medicine. Thus thousands of young doctors in excess of the professional needs of the countries in which they are being educated will be cast forth into the civil population during the next decade. It is clear that on realization of this many will wish to migrate. Sincere effort is being made by certain leaders such as Professor Volhardt to restrict the number of students admitted to the medical schools, but thus far they have been unable to curb the political pressures.

It is obvious that in most of these medical schools with extremely limited faculties, bombed-out buildings and little or no real equipment, the teaching of medicine as it is known in this country is totally impossible. The only schools which our mission visited capable of training young men to a moderately satisfactory degree were Heidelberg, Würzburg and Vienna. Even there, the lectures were crowded beyond anything found in the medical schools in this country and the students were, for the most part, maintained at a great distance from any considerable contact with patients. Experimental work, or laboratory demonstrations, were largely didactic and theoretical rather than by actual student participation. The best teaching facilities in Germany today are not comparable to those of accredited medical schools in this country. What then is to be done with the graduates of these schools when they apply ten years hence for licensure in this country? Those who have graduated but have not had prolonged postgraduate training cannot be considered as comparable to our graduates. Each of the great professors has a small group similar in function to our present resident staffs. These men may remain with him from five to twenty years. They are the privileged ones, and a few of them may rise to become true leaders of medicine and the teachers of the future. Men who can demonstrate that they have worked *en famille* with leaders of this type for a period of years might be considered as comparable to some of our graduates.

It is not within the scope of this presentation to submit detailed recommendations regarding the solution of this situation, but rather to portray the problems as they are found in Germany and Austria today, and to delineate what your boards will be confronted with in the future. The following suggestions, however, appear pertinent: (*a*) that your body conduct a survey of the status of each European university medical college annually, noting its progress toward normal or its lack of progress, its strength and its weaknesses; (*b*) this material should be made available to each of the state licensure boards; in years to come, they will then be enabled to consult this data referring to, let us say, the year 1948 and to determine whether the graduates of the school under consideration received adequate training or not; (*c*) in addition to this, the qualifications of each candidate should be considered in detail in reference to his postgraduate experience. It is not sufficient for them to state that they attended Professor X's clinic for one or five years. This may merely mean that they sat on the back row of an auditorium or that they made rounds on the fringes of a crowd of fifty with Professor X. It must be known whether they actually had a residency or family relationship with the professor and whether they became dozents[1] or held some similar position. These favored ones might well be considered more seriously for licensure in this country.

SUMMARY

In summary, medical education in Germany is at an extremely low level at this time. The Universities of Heidelberg and Würzburg are the most satisfactory. Medical education in Vienna is somewhat better, but is handicapped by overcrowding.

The major factors responsible for these deficiencies are: lack of well trained teachers, bombed-out medical school buildings, loss of equipment and inability to replace it and poor selection of students, which is under the control of political boards rather than the members of the medical faculties.

Students graduating from these schools have not received a medical education comparable with that obtained in medical schools of this country. This situation should be subjected to continuing analysis and recording by the boards of licensure so that in the future graduates from these schools who apply for license to practice in the United States may be properly evaluated.

MEDICAL EDUCATION IN LATIN AMERICA

MORRIS FISHBEIN, M.D.
Editor, The Journal of the American Medical Association
Chicago

South of the Rio Grande the teaching of medicine began long before formal instruction was introduced in North America. The first medical school was established in Santo Domingo in 1538. A medical school was organized at the University of Mexico in 1580, and other schools appeared in Lima, Peru, in 1621; Habana, Cuba, 1728; Santiago, Chili, 1756; Bogotá, Colombia, 1758, and Buenos Aires in the Argentine in 1801. There were hospitals in Latin America long before similar agencies for the care of the sick appeared in North America. The first hospital was established in Guatemala in 1503, and an excellent institution, which has grown to great size and developed scientifically, was established by a Catholic brotherhood in Santos, Brazil, in 1543.

From the sixteenth century on, the Spanish government provided health officials and scientific councils to its American colonies. As early as 1569 Peru developed a Tribunal del Protomedicato General, which was concerned with medical licensure, the inspection of drugs and investigation of new remedies. The Spanish code of Castile prevailed in its American vice royalties. Physicians today concern themselves with prenatal care and the premature child, but a paper on the welfare of the newborn was published by Francisco Laguna as early as 1781.

Unfortunately, the inspiring progress of medical education and the institutions that prevailed from the sixteenth century to the beginning of the nineteenth century deteriorated. Attempts were made under French influence to reform medical education and the care of the sick after 1830. From 1830 onward, progress was marked by some amazing contributions, but the twentieth century saw a new decline, and apparently the effects of World War I and World War II were so severe as to indicate at present a serious departure for most of South America from established scientific medical standards.

Read before the meeting of the Federation of State Medical Boards, at the Forty-Fourth Annual Congress on Medical Education and Licensure, Chicago, Feb. 9, 1948.

[1] Associate professors or a similar position.

Aristides A. Moll[1] in "Aesculapius in Latin America," published in 1944, has reviewed the growth of the medical colleges in Latin America and their gradual evolution. He presents some factual data which convey a general picture of the Latin American medical educational scene. Of the present 54 medical schools, 27 were founded in the nineteenth century. At present Costa Rica and Panama are the only countries without a medical school. Brazil has 12, Mexico 8, Argentina 4; Bolivia, Chile, Colombia, Ecuador, Nicaragua and Venezuela 3, and the others each 1. According to Moll, these schools graduate about 3,000 physicians each year from a total enrolment in the medical schools of more than 20,000 students.

The full time teacher is almost nonexistent in Latin America, and the budgets of the medical schools are completely inadequate. Most of these medical schools spend something under $300 per student per year on medical education. Moll condemned particularly the fondness of both faculty and students in the medical schools of Latin America for politics, and he referred to the manner in which students are misused by political leaders in controlling Latin American medical education.

When Abraham Flexner[2] published his considerations of medical education in 1925, he contrasted the type of teaching in French, English and German medical schools with that prevailing in the United States. The system that prevailed in France and Spain has been the model for most Latin American medical education. There are some exceptions, as will be pointed out later. Abraham Flexner pointed out that France produced only one work of any significance in the field of medical education; namely, a book by Claude Bernard published in 1865, which dealt with the logic of research but which made no reference to the organization of a medical school. In both France and Great Britain medical schools grew out of hospitals. Students were essentially disciples of individual masters. This method is conducive to the encouragement of occasional genius but is inefficient and inadequate when concerned with the education and discipline of considerable numbers of students who wish to practice a profession. These generalizations are significant in relation to such criticisms and praise as are warranted for the medicine of Latin America.

Most of what I say here is based on personal observation of many medical schools and hospitals in a tour through Latin America in July and August 1947. I viewed at first hand a considerable number of medical schools, hospitals and institutions of research. I visited areas inhabited largely by the rich but also great sections of large cities inhabited by the poor. I went into some rural areas of Brazil, Chile, Peru, Guatemala and Mexico and saw the medical care available in villages. This experience I have supplemented, as far as possible, by studying all of the available medical and popular writings on medicine and health in Latin America. What has been published is meager, superficial, hearsay, undocumented, impressionistic and thus grossly inadequate. Nowhere in recent years, except for the paper by Weiskotten relative to conditions in Peru, is there an enlightened, honest survey of a medical educational institution in Latin America. Visitors from North America are dined and entertained by the leaders of Latin American medicine with a hospitality that is unequalled in any great country that I have ever visited on the Continent or even in the United States. Visitors are given opportunity to see the magnificent achievements in the research institutions; they may walk through the wards and visit the private rooms of the leading hospitals. They may speak to the assembled faculties and students of the medical schools. Yet they have not, as far as I have been able to determine, been able to make an accurate study of the quality of medical teaching, the available medical facilities, the libraries, the laboratories and all of the other factors by which we are accustomed to judge the quality of medical education in the United States. Medical licensure is political, and I shall consider that further later in this paper.

Perhaps a statement in the biography of the Drs. Mayo merits quotation. Dr. Will Mayo visited Latin America with Dr. Franklin Martin in 1920. In the biography Miss Clapesattle[3] said:

> The spaciousness of the hospital and medical school buildings and the elaborately landscaped gardens surrounding them amazed the visitors from the United States. Nor could they find any fault with the instruction offered. Throughout South America the medical course was seven years in length and the examinations were so exacting that few North American or European surgeons could pass them, as they must in order to receive a license to practice. In the hospitals the visitors could criticize only the general indifference to screens at the windows and the scarcity of trained nurses. . . . Dr. Will summarized his impressions by declaring that the men he had watched operate were "the equal of any representative group from any country in the world."

I do not depreciate this observation because I saw research in South America carried on by competent men in institutions of the highest quality. The work of the Oswaldo Cruz Institute near Rio de Janeiro and of the Butantan Institute at São Paulo; of the institute in Buenos Aires headed by Houssay, recent winner of the Nobel prize, and work on the heart by Cossio and Taquini and Capdehourat is equivalent to the best in North America, as are the institute which Castex has carried on his research and the institute founded by Samper in Colombia. Chile has for many years had a law requiring every person who dies in a hospital to be submitted to a postmortem examination. The necropsies are conducted by competent pathologists. Thus they are superior to North America in this aspect of medical work. In Peru there is in process of construction the National Institute of Andean Biology (for the study of high altitude physiology) which will be unique. Already the contributions of Peruvian leaders like Monge and Hurtado are well known throughout the world. In México, D. F., the work carried on under Zubirán in the Hospital de Enfermedades de la Nutricion, by Chavez and Rosenblueth in the Instituto de Cardiologia de Mexico, and by a group of well qualified men in the hospital for children's diseases is worthy of world wide emulation. The School of Tropical Medicine in our own Puerto Rico is an amazing institution in which competent research has been carried on for some years on funds utterly inadequate to the possibilities. Genius is not the peculiar possession of any single nation or race; nor does it require perfection of facilities that it may thrive. In many areas of South America, moreover, men of extraordinarily brilliant minds and exceeding competence in research and practice can be found. These, however, are extraordinary manifestations which rise, like Mt. Everest, above a great valley of inertia and desuetude characteristic of the majority of medical education and research in Latin America.

[3] Clapesattle, H. B.: The Doctors Mayo, Minneapolis, University of Minnesota Press, 1941, pp. 582 and 584.

I pay this tribute to Latin America because an editorial[4] which I wrote about Brazil and which was published in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION in August 1947 aroused considerable furore in the medical profession of that country. Medical societies held meetings devoted wholly to a discussion of the criticisms made in the editorial. Medical periodicals published long editorials discussing the matter pro and con. A former minister of education and public health, Prof. Ernesto de Souza Campos, replied to the editorial in a newspaper. Several young members of the Brazilian College of Surgeons wrote polemics that were literally brilliant but without adequate evidence in reply to the specific criticisms. One of those writers considered the editorial a breach of the good neighbor policy. Several newspapers sent out inquiring reporters to ask great numbers of physicians what they thought of the editorial, and a considerable number had the courage to admit the veracity of some of the indictments. Actually, the editorial served the purpose of indicating the truth of one particular indictment. The editorial said:

> The young men who have studied medicine in the United States need all the encouragement and help we can continue to give them after they return home to practice. Perhaps one or more generations will have to pass before the real significance of what they are doing will be recognized in their own country. In the meantime they battle against the status quo. The professorships in the medical schools are appointments made for life; the staff positions in most of the public hospitals are controlled by political influence; the small private hospitals are inadequate and commercial and subject to all the abuses that were only too well known in the United States during a similar period in our own evolution.

Fortunately, several Brazilian leaders have now spoken in support of some of the statements that have been made. Professor de Carvalho, vice president of the Society of Social Medicine, said, "The majority of the criticisms contained in the article is justified," and a letter just published in the leading medical periodical of Brazil calls attention to the fact that polemic and literary discussion will not supply the medical schools with laboratories, libraries and modern methods of teaching.

MEDICAL LICENSURE

Medical licensure began in South America in 1535, when Charles V ruled that in America the same restrictions on the practice of medicine, surgery and pharmacy would apply as in Castile. The evolution of medical licensure in Latin America is detailed by Moll in "Aesculapius in Latin America." After the beginning of the nineteenth century the medical leaders gradually shook off the jurisdiction of governmental agencies in licensing physicians. The powers to license now rest chiefly in the hands of the national health or educational authorities and occasionally in special boards. Today practice by foreign physicians in Latin America is not easy. In order to obtain a license to practice, a physician coming from outside the country must validate his diploma, and it must be properly attested by a diplomatic or consular representative of the country from which he comes. The applicant in practically every instance must take examinations in all the subjects in the local medical curriculum. In some others the examinations must be taken in the language of the country concerned. The examination fees vary from $100 to $1,300. The tendency in the past has been to grant mutual recognition of medical diplomas between some of the Latin American countries and others, but most Latin American countries still make it difficult even for other Latin Americans to practice.

Among the most stimulating works recently published on Latin America is the book by Charles Morrow Wilson[5] called "Ambassadors in White." Mr Wilson, through his contacts with the governmental agencies during the war, had opportunity to observe closely the difficulties in advancing medical science and medical practice in Latin America. He recognized embarrassment caused by present restrictions on free interchange of students and physicians between North and South America. Most Latin American countries limit and in some instances completely prohibit the licensing of doctors from other countries. Mr. Wilson expressed the opinion that better reciprocity in medical licensing rules is needed, and he said, "It is unquestionably attainable." He also recommended increase in the exchange of government and private scholarships for medical students. "While receiving more Latin American medical students in our own medical colleges," he said, "it would be beneficial to dispatch more of our own students to universities and research institutions in Latin America." Incidentally, the problem of the Latin American student who comes to North America to pursue further studies is a complex and difficult one. He finds himself in a new environment in which discipline prevails far beyond anything that he has observed at home

The place of the student in the control of the Latin American medical school has evolved into one of increasing political power rather than suitable discipline. Commenting on the relation of the student to the Latin American medical school, Aristides A. Moll said

> Yet little ultimate good is obtained and often much harm is done when immature minds persist in dictating the type of teaching, forcing the selection of professors and enforcing their demands through thoughtless strikes and vociferous protests. . . . The danger also remains that the exciting lure of street meetings and irresponsible movements may lead away from the more severe discipline of the classroom and the study halls.

The situation is not recent and not necessarily associated with the present trends in social attitudes throughout the world. It is part and parcel of the system of medical education. When Hans Zinsser[6] visited Mexico around 1912, he made the following comment on the University of Mexico: "The University of Mexico is the student's paradise. Students have a voice in the University government. If a professor flunks too many pupils, out he goes on his ear. Not even the Deans are safe."

By contrast the institution of higher education in the United States conceives that educational discipline is an integral part of the education. William Henry Welch[7] said once: "No man can study medicine or any profession who has not gone through a course of study at least equal to a college course at Yale or Harvard." And again, "It is not only or chiefly the quantity of knowledge which the student takes with him from the school which will help him in his future work; it is also the quality of mind, the methods of work, the disciplined habit of correct reasoning, the way of looking at medical problems." Here in a single paragraph is essentially the ingredient missing from most Latin American medical education.

Since my visit to South America I have been endeavoring to secure some reliable data concerning fundamental factors in medical education, such as the qualifications for admission of students, the number of students admitted in relation to the available facilities, the quantity and quality of equipment in anatomy, physiology and pathology and in the libraries, the nature of administration, the available budget, the records of attendance by students and faculty and similar matters. Some of the leaders in some of the countries have been most cooperative in assisting with the necessary data. Unfortunately, others have been negligent and some have been resistant.

PUERTO RICO

Puerto Rico does not have a medical school and is thus dependent on other countries for training the necessary physicians. Recently excellent hospitals have been built, and they are well conducted.

The suggestion has been made in Puerto Rico that the needs of the rural and low income population could be met by providing great numbers of low quality physicians. This movement is political. The nation must depend on other countries to educate the young men who wish to be physicians and who would return to the island to practice. Opportunities must be developed in the United States for the training of Puerto Ricans in medical science.

TRINIDAD

Port of Spain is a British possession with segregated areas devoted to the British population, the United States army and navy posts, which have been leased from Trinidad, and the considerable area occupied by the population, which is a mixture of racial types from all over the world.

The United States hospitals, which care only for the people of the United States in our reservations, are of the highest quality developed by our armed forces. The great British hospital, which suffers under the stringency of rigid British governmental economy, has twenty maternity beds to care for 2,000 cases annually. There is one physician for every 4,000 persons, and one hospital bed for every 2,000. If a moderate rate of four or five hospital beds for every thousand persons is accepted as standard, the medical facilities of Trinidad for the population are grossly inadequate. Such statistics as are available indicate a general state of health well below the standard of most civilized countries.

BRAZIL

Belém.—In Belem, Brazil, there is a medical school, rather primitive, which is one of the twelve medical schools of Brazil. I visited the school with Dr. Orlando Lima, who is a gynecologist and surgeon, and saw the institution while the students were on vacation. He told me that the school graduates twelve students annually. Such facilities as I saw, which included those for anatomy, physiology and pathology, were on a par with the least qualified proprietary medical schools of the United States in the period between 1900 and 1910. The question naturally arises as to whether physicians educated under such circumstances are better than no physicians at all.

The community has two hospitals—one, a government institution which is the typical Latin American hospital, without screening, with inadequate laundry facilities, and the other a hospital built and staffed by the Institute of Inter-American Affairs.

Rio de Janeiro.—The medical schools in Rio de Janeiro and elsewhere in Brazil are conducted by the government. There is one private medical school in Brazil; namely, the one conducted by a Catholic group in São Paulo. The latter has the virtue of independence but suffers unfortunately from a great lack of funds.

The fees charged in most of the schools are utterly inadequate to the conduct of an institution which must depend to some extent on students' fees; teachers must depend on practice for their maintenance, since maximums paid by governments are in most instances well under $1,000.

During my stay in Rio de Janeiro the schools were on vacation. However, I had opportunity to speak at some length with some medical leaders and at considerable length with many of the young men who had done graduate study during recent years in the United States. The most frequent commentary was the difficulty experienced by these young men in gaining opportunity to teach or do research in the medical schools.

There is a woeful lack of general hospital facilities in Brazil as elsewhere.* I did, however, see a beautiful hospital just completed for the use of employees of the government. This hospital will care for such employees with a salaried staff of physicians. There are as many private rooms as beds in the wards, and higher salaried employees are permitted to pay extra for such accommodations. It is planned to conduct this hospital according to North American lines. One of the chief difficulties anticipated was the securing of competent laboratory technicians.

São Paulo.—The institutions of medicine in São Paulo, which is apparently the most rapidly growing city in South America, are far superior, in general, to those in Rio de Janeiro or elsewhere in Brazil.

The conspicuous medical problem of São Paulo is leprosy. Apparently there are some 50,000 cases in the State of São Paulo with many sanatoriums and dispensaries for the care of lepers and their children.

Near São Paulo is the state institute for the manufacture of serums, vaccines and other biologic preparations, including particularly snake venoms and venines.

The medical school in São Paulo conducted by the government is fully up to North American standards. This institution was largely developed through aid from the Rockefeller Foundation. Its laboratories, teaching units and equipment are of the highest order. Hospitals for orthopedics, obstetrics and the care of children are in process of construction. Also in process is a great nursing school, and teachers have been obtained from North America to establish this school on modern lines. If the institution is able to maintain reasonable limits on the admission of students, there is no reason why the medical school at São Paulo should not continue to be a most acceptable institution.

In process of construction also is another medical school known as the Escola Paulista de Medicina, the only private medical school in Brazil. Almost completed is a great new hospital with sufficient beds to supply teaching services in all of the medical specialties and in association with this hospital a modern nursing school.

Unfortunately the equipment for teaching anatomy, physiology, pathology and the basic sciences is meager and obsolete. The library consists of some hundreds of books and a few score periodicals which are in close rumor was that this school was maintained largely from the fees of wealthy students who had been unable to gain admission to the medical school conducted by the government. The fees for this institution were obviously far above those of any other medical school in South America.

I would be remiss if I did not mention the great hospital conducted in Santos by Dr. Pedroso, who has been thoroughly trained in hospital management in the United States and elsewhere. This institution is outstanding in its appearance, in the quality of its work and in its management. The hospital was founded in 1543 and has undergone an evolution into an institution comparable to the best in other countries.

URUGUAY

Montevideo.—The school of medicine in Montevideo, while not as modern in its construction as others, is a fine example of the best possible development of medical education according to the plans prevailing in France and Spain. The medical school is conducted by Dr. Chifflet with administrative skill. Pathology is taught with a magnificent collection of gross specimens closely correlated with slides and case histories, so that the teaching of pathology can be especially commended. The division of anatomy has adequate provision for embryology and histology. The department of physiology, recently reconstructed, has facilities second to none elsewhere, and by an arrangement with the city dog pound there is national provision for suitable experimentation on animals. The library contains 108,000 volumes with special departmental libraries, with reading rooms for French, Spanish and English publications, and there is an exchange system with a package library service.

The specific disease of this area is hydatid cyst, and there is a world famous collection of anatomic specimens. Incidentally, an exhibit from this collection received a gold medal in the Scientific Exhibit of the American Medical Association in 1942.

Near the city of Montevideo, high on a hill, is a new hospital reminiscent of our great medical centers with which will be associated a new medical school building. This hospital has been many years in process of construction, and when I saw it, it was boarded up awaiting the provision of further funds.

ARGENTINA

The problems of medicine in Argentina are primarily political.[9] The situation that prevails today in Argentina can be duplicated only by some of the strange circumstances that developed in the totalitarian countries during the years of the war.

The leading medical school of Argentina in Buenos Aires has a magnificent building built by Jose Arce. I doubt that there is any other medical school anywhere in the world with a physical structure that is its equivalent. The curriculum is adequate to the method of teaching. At the time when I was in Argentina, the medical school was still occupying the old building and the old hospitals, but the dental school was in process of installation in the new building with its vast corridors and marble columns that would dwarf even our most ostentatious capitol buildings. The dean of both the medical and dental schools, at the time I went through the building with him, was a former dentist in the army of Argentina.

There are many good hospitals in Buenos Aires and some research institutions conducted by Drs. Castex and Taquini which, by the quality of their equipment and the quality of their work, as well, are worthy of high praise. The institute of cardiology is one of the best equipped establishments for the study of hypertensive heart disease, the effects of fatigue and electro cardiography anywhere available. Twelve beds are held exclusively for research on the heart. The institute conducted by Dr. Castex offers opportunity to men of great repute for modern scientific research, and the publications that come from these institutes are widely known. Unfortunately, the Peron government fell afoul of the independence of some of the greatest teachers of our time. Dr. Castex is no longer associated with the medical school. Dr. Houssay, who recently received the Nobel prize for his studies of the pituitary, was eliminated from the school, was deprived of his laboratories and library and is at present working in a reconstructed flat building, where eleven devoted students followed him.

Most of the voluntary nonprofit hospitals had formerly derived their income from a special organization known as a Beneficencia. For many years the custom had been for the wife of the President to be the honorary president of this organization. Social attitudes in relation to the present president of Argentina resulted in a revolution in the organization of the Beneficencia, and many of the leading hospitals formerly used for teaching purposes are now finding it difficult to continue to exist and in some instances are without any adequate budget.

On Jan. 1, 1948, a new law became effective in Argentina whereby faculties are now controlled under a somewhat totalitarian system. Neither professors nor students are allowed to act directly or indirectly in politics but must confine themselves strictly to their educational functions The head of the university is designated by the government for a term of three years and must refrain rigidly from any activity not related to his official position. He is advised by a council composed of the dean and ten counselors who are elected by secret vote of the professors. The dean is no longer elected by the professors and the students but chosen from a list of three names presented by the rector to the directing council of the faculty. All appointments are for terms of three years. The universities are to be supported by a tax of 2 per cent, which must be paid by every employer on every payroll paid in Argentina except those of domestic servants and government employees. Some hundreds of the leading teachers have resigned from the faculty in Buenos Aires. A few have been transferred to other universities. Among the facilities of Buenos Aires is a magnificent cancer center with a high quality of modern equipment. This was formerly under Dr. Roffo, of whom no one now says much except to make an expressive shrug of the shoulders.

As a result of the changing social points of view developing in Argentina, the medical school is overwhelmed with students far beyond its ability to provide adequate instruction. There were 1,146 students in 1946; 1,492 in 1947. In previous years the number was 500.

The Argentine has more physicians in proportion to its population than any other country in South America It is estimated that there is 1 physician to 835 persons, as contrasted with 1 to 775 in the United States, but with 1 physician to 13,000 in Guatemala, 1 physician to 6,000 in Peru and Bolivia and 1 physician to 3,000 in Brazil. Moreover, the concentration of physicians is almost wholly in Buenos Aires and a few lesser cities.

---

[9] Greenup, R., and Greenup, L.: Revolution Before Breakfast, Chapel Hill, N. C., University of North Carolina Press, 1947, p. 207.

In the provinces the situation is far worse than in any similar rural area in North America.

CHILE

The school of medicine of the University of Chile has excellent departments of anatomy and a new department of physiology in process of construction; research goes on constantly. Chile has had for many years a law that there must be a postmortem examination on every patient who dies in the hospital. One sees four or five postmortem examinations going on constantly, and there are available rooms with the most modern projection facilities for conferences to which diagnosticians, surgeons and pathologists may discuss the results of their study.

There are three universities in Chile. The University of Chile itself is a national institution supported by the government and ruled by a statute which gives it absolute freedom from political or personal interference. The rector, who is equivalent to the president of the university, is elected by a council of professors. They present a list of three names to the president of the Republic, who traditionally selects the first name on the list as his choice. The university is controlled by a governing body formed by the deans of the different faculties and by those members who are appointed by the president.

The Catholic university is supported by the Catholic church and the Universidad de Concepcion is also private and is supported by a lottery. Theoretically both of these universities are under the control of the University of Chile, which arranges the curriculum, conducts the examinations and confers the titles in professions that require recognition, such as law and medicine. Neither of these two universities has developed beyond the fifth year of medicine. Students of the sixth year go to the University of Chile, where they finish their preparation. The program of instruction follows the French type.

The lower grades are followed by courses which lead to the degree of bachelor, representing two or three years beyond the high school education in the United States. Then comes the medical career, which covers seven years. Students usually cannot complete their duties and provide a thesis on time, so that they receive their diplomas in the eighth year. The students begin to go to the hospitals in the third year. The hospitals are supported by Beneficencias and by the government social security system.

Studies are free of charge, and their fees are nominal At present there are about 1,000 persons in the medical school of the University of Chile covering the seven year period. Whereas many hundreds enter in the first year, only 120 are graduated. Anatomy is studied the first two years. There are fifty tables and about 200 bodies available each year. Of these 200 bodies, 140 have been previously submitted to postmortem examinations. Physiology is most advanced, with a full time faculty. Students experiment on all types of animals. There are numerous research laboratories.

The library of the medical school is at present being reorganized by Mr. Edward Heiliger, sent to Chile by the American Library Association. In the library of the medical school there are 15,100 volumes, of which only 1,550 are used regularly. The large collection is in process of cataloguing. There are great collections of periodicals. The library now receives regularly 249 periodicals.

After graduation from the University of Chile the student receives the degree of doctor of surgery, which gives him the right to practice medicine and surgery in Chile.

Information concerning the University of Chile medical school was obtained not only by a direct inspection of every department and all of the hospitals associated with the school but also confidentially from two completely independent sources.

The Chileans delight in being called the Yankees of South America. Their medical leaders are capable. Many of them have contributed to scientific medical periodical literature throughout the world.

The great needs of Chile are distribution of medical service to the rural areas, schools of nursing and methods of control of their leading problem, which is tuberculosis. There has been complete cooperation between the Institute of Inter-American Affairs and the Chilean government. Our government has been of aid in building a great new sanatorium for tuberculosis known as the Trudeau Sanatorium and in aiding in the construction of an institute for the study of bacteriology and preventive medicine. In connection with this institute I saw the only establishment in all of South America for the manufacture of penicillin. It produces 100,000,000 units daily, or 3,000,000,000 units per month. In the United States our present production exceeds 1,200,000,000,000,000 units per month.

The great problem of all of the Latin American countries is tuberculosis, where it is still captain of the men of death. On the west coast of South America particularly it is the number one problem. The attack is being made by the establishment of diagnostic centers with adequate x-ray equipment, by providing information regarding suitable nutrition and rest and by extensive experimentation with BCG vaccination.

PERU

Dr. H. G. Weiskotten,[10] chairman of the Council on Medical Education and Hospitals, visited Peru recently and published in the *Journal of the Association of American Medical Colleges*, November 1947, a report of his visit. His study of medical education in Peru was based on accurate investigation of the available facilities and represents the type of study that should be given to every medical college in South America. I shall not elaborate on the details that he presents other than to record changes that have occurred since his visit and to emphasize recent aspects of medical education in Peru that need such emphasis.

There is a considerable excess of students for the facilities available in the medical school. The school could reasonably accommodate 80 to 100 students in the first year. Up to 1942 it was limited to 70. The class entering in 1944 numbered 250, and the class entering in 1947 was between 350 and 400.

Instruction in the basic sciences is therefore theoretical. A teacher in histology told me that he had to accommodate the teaching of histology to 300 students with twenty microscopes. The teaching staff has been increased to meet the great number of students, but obviously the faculty members, who are clinicians, find both time and facilities inadequate to the demands. As a consequence of a law approved by the Peruvian congress in 1946, the governing council of the faculty is composed of two thirds professors and one third medical students. Among the students are some who have just entered the medical school. The intervention of students in the administration and technical activities of the faculty is unfortunate, especially since students now entering have less cultural background than those who entered formerly. Because of the intervention of the students in administration, discipline is disappearing. Examinations are modified to meet requirements set up by the students. A leading member of the faculty informed me that the influence of men who have returned to Peru from other countries has resulted in great stimulus to research. In process of construction is a laboratory for the study of high altitude physiology under Drs. Monge and Hurtado, who are world renowned for their contributions to this field.

---

[10] Weiskotten, H. G.: Medical Education and Medical Licensure J. A. Am. Coll. **22**: 331 (Nov.) 1947.

One of the greatest difficulties of all education in Peru and in many other Latin American countries is the existence of innumerable holidays. Not only are there the usual holidays related to the church but holidays declared for military victories resulting from innumerable wars and revolutions, holidays declared in honor of the deaths of recent politicians and holidays declared by the government apparently at will. With one medical leader I went over the total number of days that were already established as holidays for the remaining four months of 1947 with an indication of from thirty-eight to fifty-eight days likely to be lost by such occurrences. A student may be absent from the school for 20 per cent of the time, if the governing board already mentioned decides his capacity is sufficient to permit this.

The faculty-student board determines the qualifications of applicants for admission to the school of medicine. In recent years practically all applicants have been accepted without examination, have completed the required premedical studies, which included a total of thirteen years from entrance into the first grade of school at the age of 6. There are no full time faculty members or officials in the school except the secretary.

An interesting innovation which became effective in 1947 provides that the students may exercise a right of veto once every six years. Any faculty member may be forced to resign by the board of students if they vote a veto.

In general, all buildings, classrooms, laboratories and teaching facilities are deficient and inadequate except for physiology and pathology, which are well housed with animal and laboratory facilities. The library of the medical school owns 12,000 books and has a qualified librarian. The library receives 250 different medical journals each month. The funds available for the school are completely inadequate. The tuition cost is less than $40 per year, and all equipment, including microscopes, must be provided by the school. There are 300 bodies available for dissection and seventy-three dissection tables. There are eight tables for the study of animal physiology.

Obviously the prevailing system of medical education makes it difficult to believe that the average student coming from such a system of medical education could pursue his medical education to higher levels at the same time as students graduated from the competent schools of medicine in the United States who are undertaking similar work.

I have omitted consideration of the social system and the hospitals, since they constitute a special subject. The social security system in Peru covers 250,000 insured workers out of the millions of inhabitants. Those covered by the social security system can be admitted to a number of hospitals which are conducted on a high level. The mass of the people are cared for in charity institutions, where thousands of patients occupy space available for hundreds and where there is practically a complete absence of nursing service and even good sanitation. Typical of the situation is the fact that in all of Peru there is only one modern incubator for the care of the prematurely born child

COLOMBIA

The minister of health of Colombia is changed with considerable frequency, and the functions of care of the public health and medical education are therefore administered in an unstable environment. The private hospitals are developed along modern lines, but the public institutions function in a sadly unsanitary and unstable manner. I visited a public hospital in which the private patients received excellent care, but the charity patients were sad indeed.

The school of medicine is an old structure with too many students for its facilities. The department of physiology is efficient, but the department of pathology is woefully weak. The library is ancient. There seemed to be not only a lack of information concerning great advances in medicine made in North America but somewhat of a disinclination to be disturbed about it. The scientific literature referred to is for the most part Spanish and French. While graduates of the University of Colombia have in the past come to the United States for advanced education and have done rather well, there is no reason to believe that the quality of education now is as good as it was previously. The difficulty lies unquestionably in the lack of faculty and the depreciation of the facilities and the tremendous disinclination to introduce new ideas or new blood.

PANAMA

Panama is without a medical school. Its medical profession must, therefore, obtain its education elsewhere. The lack of adequate teaching facilities would make the introduction of a modern medical school exceedingly difficult. Even more serious would be the securing of sufficient funds to operate a good medical school.

GUATEMALA

In Guatemala City the medical school has 500 students in the first year, and about 50 graduate in the sixth year. There are a few hundred books in the library. The equipment, except for a new department of experimental surgery, is obsolete.

There is a great general hospital which cares for some 1,800 patients in space adequate for 800. Serious attempts are being made to modernize this hospital. A new hospital called the Roosevelt Hospital, of one thousand beds, is in process of construction. The San Jose Hospital, operated by a charity order, does apparently good work for the underprivileged with inadequate equipment, facilities and staff.

Guatemala[11] is a nation with some 3,500,000 people, 80 per cent of whom are illiterate Indians, undersize, undernourished and apathetic.

At the San Jose Hospital, which is built in the Spanish style with the wards around patios, it was startling to observe patients with cancer sit in the patio with considerable numbers of vultures on the roofs nearby and even feeding in the gardens.

MEXICO

The medical school of the National University in Mexico is under the administration of a council elected by the faculty of the university with the director as chairman. An admissions committee is urging higher standards of admission. The student must attend at least 80 per cent of the lectures and demonstrations to get credit for any given subject. The buildings are old, but the government contemplates a new building in 1949. The clinical facilities are excellent, with great numbers of hospitals supplying thousands of beds. About 230 necropsies are done each month for teaching purposes. The preprofessional educational system in Mexico follows closely the European plan already mentioned. First a boy has six years of primary instruction and five years of preparatory school corresponding to the Gymnasium of Germany, then a medical school with six years in curriculum.

---

[11] Kelsey, V., and Osborne, L. D.: Four Keys to Guatemala, New York, Funk & Wagnalls Company, 1946, p. 196.

The number of students registered in the freshman class is 900, but it has been limited to 700 for September 1948, and there is a hope of continued limiting of admission to 500. The school certainly does not have the facilities for such great numbers, and the number graduating in the sixth year is far below the number admitted, representing approximately 150.

There are many excellent libraries. Recently the Institute of Inter-American Affairs donated 2,000 new American textbooks to the library of the school of medicine. In physiology there are ten tables with equipment available for studies on the dog, and that number is to be increased to twenty-five in the next year. The university has just received a grant of $100,000 for improvement of its laboratories in teaching the basic sciences.

There are some provincial medical schools which are far behind the national school. There is a military medical school which is exceedingly careful about the admission of students, and there is a military hospital for advanced training which is amazing in its quality.

Much of the credit for the advancement of teaching of medicine in Mexico should go to Dr. Salvador Zubiran, at present president of the University of Mexico and also director of the institute for nutrition and research in metabolism. He is far sighted, constantly aware of progress elsewhere in the world, and earnest in promoting high quality of medical education. There is an institute for the study of cardiology directed by Chavez which is superior to any similar facilities in the United States. The new children's hospital associated with the general hospital has five hundred and fifty beds, and the quality of the service is again of the highest. A new maternity hospital with four hundred beds is in process of construction, and the plans have been drawn for rebuilding the general hospital with all services providing one thousand, two hundred beds in a modern institution.

SUMMARY

The fundamental inadequacy of the medical teaching in Latin America is admission of students to the freshman class far beyond the ability of the school to provide adequate education in the basic medical sciences, including particularly anatomy and physiology. The great number of students makes teaching by lecture and demonstration the method of choice rather than individual participation.

The internship as such is not used in most Latin American countries. The assistantship is emphasized, but the students remain for long periods under the professors. Nursing is so infrequent as to be for the vast mass of people relatively unknown. Customarily, patients come into the hospitals accompanied by a member of the family, who remains to care for them for the periods of serious illness. Discipline is lacking, as is inevitable when students join in the administration of an institution.

Public health in Latin America is in the embryo stage. Death rates from tuberculosis are vastly in excess of those in the United States, and in all Latin American countries tuberculosis is first in the list of causes of death. In the United States it is seventh. Infant mortality, another measure of public health, is accompanied with rates so high as to be unbelievable. Thus in Chile I was told that one half of the children who are born die before they are 9 years old. Nevertheless, all statistics must be viewed askance, since modern biometrics are simply lacking. In most South American countries a small wealthy upper class is associated with a tremendous undernourished, impoverished and illiterate lower class.

Because of lack of access to modern periodical medical literature during the period of war, physicians have not kept abreast of advances in medical science. There is a tendency to overindulge in hypodermic medication. Knowledge of allergy has not progressed as it has in the United States. Pharmaceutic agencies, many of them branches of North American organizations, continue to supply preparations representing the worst type of polypharmacy, including mixtures of inefficient glandular products and vitamin combinations that are already beginning to disappear in North American medicine.

The special problems of Latin America include malaria, leprosy, typhoid, dysenteries and undernutrition, in addition to tuberculosis and the rarer tropical diseases.

There should be for the advancement of medical education in Latin America a competent survey of each school of medicine of the type made by Dr. Weiskotten in Peru, with a recommendation to the faculty and to the government as to the procedures that should be followed in bringing about progress.

Medical education is vital and fundamental to improvement of the public health and to the development of adequate leadership for overcoming the controllable diseases that now constitute a tremendous burden for the people. The advancement of sanitation in order to control unnecessary mortality from the diseases that have been mentioned is fundamental to improving the productive capacity of the people of these nations. The situation constitutes a vicious circle. The sick people cannot produce. Without production funds are inadequate to make progress even against sickness.

Strictly from the point of view of medical education, I must emphasize that the vast majority of Latin American nations do not welcome physicians from North America and make well nigh impossible the securing of a license. Nevertheless, most of our licensing boards will admit graduates of leading Latin American medical schools to the examinations, and considerable numbers of them have qualified in the past to practice in the United States. However, a suitable inspection of the medical schools would undoubtedly indicate that not more than five or six out of the present approximately fifty-four schools could today meet our minimum standards. Many of the graduates of the Latin American schools are coming to the United States for graduate study. For the most part they come with inadequate preparation in the basic medical sciences, and they find exceedingly difficult continuous pursuit of advanced study. When they return, local political conditions make it difficult for them to contribute even in their own countries the knowledge and the practice that they have developed in their graduate study.

May I emphasize again that genius is not the particular property of any nation or race, nor does it require perfect facilities that it may thrive. In many parts of South America men of extraordinarily brilliant minds and exceeding competence in the field of medical research and medical practice can be found. Every possible encouragement should be given to such men to enable them to do the most that can be done for raising the general standard of medical education and medical practice in the Latin American countries.

LICENSURE EVALUATION OF EUROPEAN MEDICAL GRADUATES

JACOB L. LOCHNER Jr., M.D.
Albany, N. Y.

The Evaluation of Foreign Medical Credentials sounds uninteresting, and when Dr. Bierring asked me to speak at this meeting he suggested the title "Implications of Foreign Medical Graduates in Licensure," which to me seemed to be of more interest. This short presentation is therefore really a combination of both titles. I believe that you all know and realize that New York state has undoubtedly licensed more foreign born and foreign educated physicians than any other state in the Union. This large influx of foreign physicians in New York state began about 1926, and at that time the University of the State of New York was candidly unprepared to evaluate their credentials properly. As soon as the Board of Regents became aware of this situation they attempted to remedy it by requiring that all foreign medical credentials be evaluated by the Assistant Commissioner for Higher and Professional Education.

To determine properly the actual scholastic and professional standing of each foreign school from which the applicant presented credentials for recognition, the department set about the task of studying thoroughly each separate national system of education not only as it applied to university or professional study but also as it applied to the entire educational program of the country in question. In order to make a thorough investigation, the department consulted the experts on foreign education in the Office of Education at Washington and obtained further information from the offices of the American Medical Association, from the deans of many American Medical Colleges and from the offices of various outstanding national educational organizations. The 1932 report of the Commission on Medical Education which was organized in 1925 by the Association of American Medical Colleges substantiated the evaluations made by the department. This commission included many outstanding authorities on medical education. As a result of this complete study it can be said that between 1850 and 1913 German medical education was as good as any in the world and better than that of many other nations. In Austria-Hungary, in Scandinavia, in Holland and in German-speaking Switzerland the university type of medical school developed as it had developed in Germany. Before 1910 there were no barriers to the free migration of students and professors from one country to another. Neutral countries were not materially affected in regard to medical education by World War I, except for certain financial difficulties. Medical education in Austria was seriously affected by Hitler in 1938. The same holds true of the medical schools in Czechoslovakia and Hungary. The status of Russian medical schools is and has been questionable since prior to 1917. Except for one university in Greece and one in Turkey medical education in the Balkan states is not considered the equivalent of American medical education. The same policy would apply to Spain and most Spanish-speaking countries.

PRESENT POLICY OF NEW YORK STATE BOARD

The department insists that each applicant's credentials continue to be examined entirely individually and accepted or rejected on their own merits.

The present policy of the department in regard to foreign medical education is that medical education begun in Europe after Jan. 1, 1940 will not be recognized for admission to the New York state medical licensing examination with the possible exception of medical study completed in the Universities of Cambridge or London in England, the University of Dublin in Ireland and the University of Ireland. They further require that on account of the impact of World War I on foreign medical education, no foreign medical license issued after 1914 could be endorsed without examination. The result of requiring medical applications to pass through the office of the Assistant Commissioner has given the department a complete record of the curriculums and standards of every medical school in continental Europe. In my opinion our records are even more complete than the records in the United States Department of Education in Washington, D. C. Under this policy we require every foreign-educated physician to submit his studentbooks, leaving certificates, diploma and license for medical practice. Now, what has been their success in passing the New York medical licensing examination? Their attitude has been, and strangely enough still is, that of arrogance and superiority. The majority have shown no friendliness or thankfulness to be allowed to come to this free and democratic country. They clearly resent being required to show their credentials and required to pass an examination. If they fail to pass they immediately make a loud cry and may complain to the Governor, a senator or an assemblyman that they answered perfectly and were being discriminated against. They always say that they know their rights, and yet most of them have been in this country only a short time. Not one out of a hundred candidates from approved schools will complain about the results of the examination yet many of the foreign physicians will complain! Do they come alone to complain? No! In practically every case they bring or send a member of the legislature, or even a member of Congress. For example a foreign-born physician who had taken our examination fourteen times without passing brought a member of the Senate to my office and insisted loudly that he knew as much as any American doctor and that he had answered the questions correctly and was being discriminated against because he was foreign born. I was able to convince the Senator that the answers were wrong, and I suggested that the doctor try the examination in some other state, which he did, and passed in his first try. The senator later thanked me for my advice.

The greatest number of foreign physicians were admitted to practice in our state in 1936-1937. During the next decade we licensed more foreign physicians each year than were licensed by all the other states

---

Read before the Forty-Fourth Annual Congress on Medical Education and Licensure, Chicago, Feb. 10, 1948 together. During the war years there were of course only a few foreign physicians who were able to come to the United States. Since the war the number of foreign physicians has increased greatly, and by the number of letters which my office is receiving every week we can expect a considerable number in the next few years.

RESULTS OF EXAMINATIONS OF FOREIGN PHYSICIANS

The results of the New York state medical licensing examination by foreign physicians has not been good, and it has varied practically not at all throughout the years—the percentage of failures has been around 66. In 1938, 1,211 graduates of foreign medical schools took our licensing examination and 511 passed. In 1939, 1,770 foreign graduates were examined; 521 passed; in 1940, 1,644 foreign graduates were examined; 540 passed; in 1941, 1,558 were examined and 575 passed; from 1942 to 1946, 4,975 were examined and 2,878 passed. In 1946, 315 were examined and 106 passed. In going over our records from June 1945 through February 1947, I found the percentage of failures of foreign graduates to be between 72 and 78. I was asked to present statistics on these failures in regard to the basic science subjects as compared to the clinical subjects. My answer to that request is that they show no difference in failures in the basic sciences as compared to the clinical sciences. I would like to point out a strange coincidence—you all know that by special rules of the Board of Regents certain graduates of grade B schools were admitted to our licensing examinations—the results for Middlesex medical graduates in the first two or three examinations was nearly comparable to foreign graduates, while another unapproved school had results as good as the students from approved schools outside of the New York state schools. The answer to this discrepancy was easily explained, since all of the teachers of the basic sciences and most of the clinical subjects at Middlesex were found to be refugee physicians. It has been my opinion that foreign physicians should be required to serve two years in an approved hospital before being admitted to the medical licensing examination in order that they may become familiar with American methods, American ethics and that certain sympathetic understanding in regard to the relationship between physician and patient that is decidedly lacking in physicians educated abroad.

NATIONAL ASSOCIATION FOR RESETTLEMENT OF FOREIGN PHYSICIANS

I want to take this opportunity to bring to your attention the fact that there is at present functioning the "National Association for the Resettlement of Foreign Physicians." The work of this organization is fulfilling a distinct need. The foreign physician is questioned as to his training, experience and practice and advised how best to fit himself for assimilation into our professional life, and I am told that he is usually advised to take an internship and a refresher course, which is given at the expense of the organization. This in my opinion is one of the most logical approaches to the situation, and this organization deserves a great deal of credit.

POLICY OF VETERANS ADMINISTRATION

And now in closing I present what I consider our biggest and most serious problem: I was shocked and amazed some time ago to learn that the Veterans Administration in Washington was advising veterans that they may attend any medical school in Europe at government expense, and they enclosed a mimeographed list that as far as I was able to ascertain named every single medical school abroad. You realize the serious implications of such a policy—it means that if these men go abroad and study medicine they will undoubtedly return to this their native country, and if they are unable to gain admission to the examination in their home state a cry of sympathy will go up; unless I am mistaken this will result in extreme pressure being brought to bear for these our veterans. It is my opinion that we should take steps to stop it now; tomorrow will be too late. I corresponded with the Veterans Administration in Washington on November 17 and under date of December 1 I received a letter from the Director of Registration, Research Service for Vocational Rehabilitation and Education, and a mimeographed list of schools of medicine in Europe. The first paragraph reads as follows:

> Lists of schools of Medicine in Europe independently established or connected with universities, which have been approved, insofar as the Veterans Administration is concerned, for the education of veterans under the provisions of Public Law No. 346, the Servicemen's Readjustment Act of 1944, as amended, otherwise known as the G. I. Bill of Rights.

Then follows a paragraph marked "special note," advising veterans of the names of eighteen states that will not accept foreign medical education and urging the veterans to check with his state board of medical examiners as to the acceptability of work from the foreign medical school which he has under consideration. It is said in this note that the information on foreign medical education was taken from THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION of May 13, 1945. Even though some veterans do inquire of their state board, I think you will agree with me that many will study abroad without making any inquiry, solely on the authority of this list backed by the Veterans Administration. I therefore suggest that secretaries of state boards and the Council on Medical Education write to Mr. Sam H. Coile protesting against the present policy. New York state has more physicians per capita than any other state or country, and the requests for endorsements of other state licenses continue at a high rate.

PRESENT STATUS OF NATIONAL SCIENCE FOUNDATION LEGISLATION

HOMER W. SMITH, Sc.D.
New York

On June 5 of last year, the Senate passed the National Science Foundation bill S. 526 by a vote of 79 to 8. A parallel bill (representing H. R. 1815, 1830 and 1834, introduced by Representatives Case, Mills and Priest, respectively) was passed by acclaim in the House a few days later. In both bills the authority of the Foundation was vested in a Board of twenty-four members, who were to be appointed by the President. The two bills differed, however, in that the Senate bill gave the President the power to appoint the Director (with the advice and consent of the Senate) after receiving nominations from the Board, whereas in the House bill it was specified that the Director was to be appointed by, and was to be responsible to, the Board. The compromise bill agreed on in joint conference followed the House bill, in that it stipulated that

Table 5, which is fully explained in the text, has been omitted and will appear in the author's reprints.

the Director was to be appointed by the Board, and it was in this form that the legislation was sent to President Truman.

The President submitted this bill to pocket veto on August 6, giving his reasons in a memorandum which was widely publicized. Perhaps the most significant point in his memorandum was the statement that the proposed Foundation "would, in effect, vest the determination of vital national policies, the expenditure of large public funds and the administration of important government functions in a group of individuals who would be essentially private citizens. The proposed National Science Foundation would be divorced from control by the people to an extent that implies a distinct lack of faith in democratic processes."

New bills have been and will be introduced in the present session of Congress. One such bill, H. R. 4852, has already appeared in the House, sponsored by Representative Priest of Tennessee. This closely follows S. 526 as passed by the Senate last year, retaining the authority in the Board but giving the President the power to appoint the Director. Other bills are on their way. It is known that Senator Smith, Representative Wolverton, Mr. Steelman and Mr. Webb, of the Bureau of the Budget, have been attempting to find a compromise position satisfactory to the President, to the Congress and to scientists. A few days ago, Senator Smith's office advised me that they are optimistic that a satisfactory compromise will be reached within the next few weeks.

The President wants a National Science Foundation; Congress wants it, and the scientists want it. What, then, are the difficulties? The major difficulties still lie in the question of who is to run the foundation, and the relationship of the foundation to the over-all scientific program of the government.

THE STEELMAN REPORT

The importance of this issue can be appreciated only after looking at the total picture. Many important data have been made available to us in the recent report "Science and Public Policy" (Aug. 27, 1947), prepared at the President's request by Mr. John R. Steelman. In preparing this report Mr. Steelman had the advice of a number of persons both within and outside government circles, but that the report essentially reflects Mr. Steelman's personal opinions is clearly implied in his introduction.

From this report one learns that $1,160,000,000 was spent in the national research budget in 1947 by government, industry, the universities and miscellaneous sources. The government spent $625,000,000 (exclusive of atomic energy), industry $450,000,000 and the universities $45,000,000. It may seem that $1,000,000,000 is a large sum to spend on research and development, but it is to be noted that half of this sum represents governmental expenditures, and of this fraction almost five sixths ($500,000,000) was spent by the War and Navy Departments, overwhelmingly for research on weapons, vehicles, food, clothing, transportation and other matters of military importance. The universities' expenditures in all fields of science account for only 4 per cent of the total.

The Steelman Report recommends that by 1957 we should spend at least 1 per cent of our national income for research and development in the physical and biologic sciences, with much more emphasis on basic research, health and medicine and nonmilitary science than at present. This figure would exceed $2,200,000,000 a year, of which government funds would possibly supply half. Broken up by areas of research, the report suggests that $440,000,000 should be spent for basic research, $300,000,000 for medical research, $1,000,000,000 for nonmilitary development and $500,000,000 for military development

Military development.	500

These figures are possibly optimistic, and it is perhaps more pertinent to examine the proposed federal research program for the coming fiscal year (1948-1949), as revealed in the President's recent budget message. Out of a total of nearly $40,000,000,000 in the National budget request, approximately $900,000,000, or about 2 per cent, is pointed toward research and development. The largest spender is, of course, the National defense establishment, where the Navy leads with $219,000,000, the Air Force comes second with $145,000,000, and the Army third with $81,000,000; with other expenditures by the National defense establishment, these items total $550,000,000. Exclusive of atomic energy, the largest single area of research in the national defense program is aviation. when one adds the budget of the National Advisory Committee on Aviation to the expenditures of the National defense establishment in this field, the aviation total is $220,000,000. The Atomic Energy Commission will spend $660,000,000, a figure which is made public for the first time and one which exceeds all other defense items added together. (This figure is not included in the $900,000,000 already mentioned.) The Department of Agriculture will spend $50,000,000; the National Advisory Committee on Aviation $48,000,000; the Department of Interior, $38,000,000; the Department of Commerce, $18,000,000, and the United States Public Health Service, $27,000,000. The President included in his budget $15,000,000 for the proposed National Science Foundation. He anticipated that only $5,000,000 would be needed in 1949 but that another

$10,000,000 would be required to cover contracts extending into later years.

The $27,000,000 for the Public Health Service is directed entirely at medical research and development.

TABLE 4.—*Budget Request, United States Public Health Service, 1948-1949*

	Millions
Total	$27.0
National Institute of Health	13.6
National Cancer Institute	8.3
Construction	5.0

Research fellowships and grants sponsored by the National Institute of Health account for $13,600,000, while the National Cancer Institute requires $8,300,000 for research activities related to the prevention and cure of cancer. It is proposed to use the remaining $5,000,000 for construction of new research facilities for general medical research, including cancer and cardiovascular diseases.

The Steelman Report estimates that a total of $110,000,000 from all sources was expended for medical research in 1947, of which industry supplied 45 per cent, federal, state and local governments 28 per cent, foundations 13 per cent, voluntary associations 9 per cent and other sources 5 per cent. These figures exclude university expenditures from their teaching budgets and other sums of university origin, since these figures are small and probably not subject to calculation. However, some of this $110,000,000 has, of course, been spent in the universities—most of the foundation money and a substantial part of industrial and federal money has gone into university research

The federal government's direct investment in medical research has increased from less than $5,000,000 per year in 1937 to more than $28,000,000 in 1947. The channels of expenditures for 1947 are shown in table 6. In 1937 less than $100,000 of federal money was spent on medical research in universities, private institutions and industry; this extramural financing has increased to over $10,000,000 in 1947, when it accounted for nearly one third of the total federal expenditure for medical research. The government is to an increasing extent getting its medical (as well as other) research work done outside its own laboratories.

TABLE 6.—*Federal Expenditures in Medical Research*

Fiscal 1946-1947		Thousands
Total		$28,150
War Department		6,040
Navy Department		5,940
Federal Security Agency	$12,585	13,585
Public Health Service	490

Children's Bureau	115	
St. Elizabeth's Hospital		
Veterans Administration		2,520
Tennessee Valley Authority		260
Department of Commerce		50
All others		100
Extramural expenditures		10,000

It is noteworthy that this government aid to extramural medical research is highly concentrated in a small number of institutions. More than one quarter of the five hundred and forty research projects supported by federal agencies in 1947 were located in seven medical schools. Nearly 40 per cent of all National Institute of Health grants in that year were located in ten medical schools, and 43 per cent of all medical research contracts sponsored by the Office of Naval Research were located in eight medical schools, four of which were among the ten schools heading the National Institute of Health list of grants. In noting this concentration of federal aid in a few schools, Mr. Steelman is not approving it. But it is implicit in his report that when one is spending the taxpayer's money and wants to get a job done, a conscientious and wise administrator will put his contracts with persons or institutions who appear to be best qualified to do the job. Any other action would be malfeasance. However, the problem remains of how to foster research, to entice personnel and to supply equipment to institutions where research is now not well developed, for no one entertains the idea that research ability is conditioned by geography. The National Institute of Health, the National Advisory Health Council and the Office of Naval Research are all aware of this requirement, and are trying within the provisions of existing law to make funds available for the development of research in less favored institutions. This would certainly be one of the important tasks of a National Science Foundation. But those familiar with Congress, with the Bureau of Budget and with the psychology of taxpayers will recognize the difficulties in this task.

Our present expenditures for research in all fields are of course many times what they were before the war. In 1930 our total national expenditure for research and development was $166,000,000. This figure has risen to an average of $600,000,000 during the years 1941 to 1945, the big increment after 1938 being related to the war, as is shown by the fact that the expenditures of the government rose from $23,000,000 in 1930 to $500,000,000 in the years 1941 to 1945. Meanwhile the expenditures of the universities have actually decreased, and for the interval from 1941 to 1945 have averaged substantially less than one half of the level obtaining in the previous decade. The universities spent 12 per cent of the national research budget in 1930, and only 2 per cent from 1941 to 1945. As government spending has increased under the unavoidable impetus of war, the universities have been relegated to a financially minor and dependent position. What will happen in the future? The problem is a complex one, and no prognostication can be ventured now.

TABLE 7.—*National Research Budget (in Millions)*

Year	Total	Federal Government	Industry	Universities	Other

* Twelve per cent of total.
† Two per cent of total

Mr. Steelman emphasized that the rapid expansion of research within numerous federal agencies makes better coordination of this research imperative. He listed three requirements: 1. An over-all picture of research and development among various federal agencies must be available. 2. A central point must be provided where the maximum interchange of information can be effected with respect to programs and administrative technics in these agencies. 3. There must be a single office close to the President at which the most significant problems created in the research and development program of the nation as a whole can be brought into top policy discussions.

Setting up an organization to accomplish these ends is not a simple task. Steelman said that the possible creation of a Department of Science was considered but that after consultation with scientists and administrators this was rejected.

Instead, he recommended that there be created an Interdepartmental Committee for Scientific Research, which was to include the Directors of the Geologic Survey, the Agricultural Research Administration, the Bureau of Standards, the National Advisory Committee on Aeronautics, the National Institute of Health and the Research Branch of the Atomic Energy Commission and appropriate representatives from the National Military Establishment (Army, Navy and Air Force), with possibly a representative from the Department of State and the Civil Service Commission, and the Director of the National Science Foundation if and when this comes into existence. (There are, however, eight or nine government agencies other than those named which are interested in research. For example, the Veterans Administration cannot be ignored.) Through this Interdepartmental Committee the scientific work of the federal agencies could be brought into balance and improved.

Shortly after this recommendation, such an interdepartmental Committee was, in fact, created by Presidential directive (December 1947), and it is now operating.

To return to university expenditures, the Steelman Report recommends that by 1957 some $250,000,000 should be spent through the National Science Foundation for basic research in all fields in universities and colleges. This figure does not include undergraduate scholarships and graduate fellowships, which Steelman thought should be incorporated into a broad program of financial aid to higher education of all types. The National Science Foundation should, he thought, be an inline government agency headed by a director who is appointed by the President and who is to be assisted by a part time advisory board of scientists and educators. Half of this advisory board should be drawn from existing federal agencies and half from the universities. The Foundation would thus be closely analogous to certain existing agencies, which use the services of nongovernmental scientists in an advisory capacity. Federal aid to medical research should be administered by a subcommittee composed of government and nongovernment scientists which, as part of the National Science Foundation, should function within the framework of the Interdepartmental Committee.

Expenditures for medical research alone expended through all channels, which totaled $110,000,000 in 1947, should, according to Mr. Steelman, be at least tripled by 1957; i. e., increased to a total of $300,000,000 per year. He gave no estimate of the amount which might go to the medical schools.

REPORT OF PRESIDENT'S COMMISSION ON HIGHER EDUCATION

Supplementing these data from the Steelman Report are the extremely valuable data recently presented (December 1947) by the President's Commission on Higher Education, working under Mr George F. Zook, Chairman of the American Council on Education This commission, in its report entitled "Higher Education for American Democracy," recommended that $150,000,000 per year be made available for scholarships and fellowships in all fields of higher education.

This highly interesting report estimates that one half of the population has the mental ability to complete fourteen years of schooling with a curriculum of general and vocational studies which should lead to gainful employment or further training at an advanced level, and that one third of the population has the mental ability to complete an advanced liberal or professional education. These figures far exceed the actual school enrolment at the present time. Only one tenth of the population in the age group of 20 to 24 years is attending school, presumably (and this is only implicit in the Commission's report) because of inadequate finances.

The American people, according to the Commission, should set as an ultimate goal an educational system in which at no level—high school, college, graduate or professional school—will a qualified person in any part of the country encounter an insuperable economic barrier to the attainment of the kind of education suited to his aptitudes and interests. Not only should high school education be improved and provided for all normal youth, but education through a two year junior college should be made available to all in the same way that high school education is now available, and financial assistance should be made available from the tenth grade through the two year junior college to competent students who would not otherwise be able to continue their education. Tuition should be lowered in publicly controlled colleges, and deserving students who require aid should receive it through four years of college and *through professional training.*

The Commission recommended, as does the Steelman Report, that financial assistance to undergraduate and graduate students of science should be administered not through the National Science Foundation but through a federal agency responsible for a broad program of scholarships and fellowships directed toward all forms of education, leaving it to the recipients to choose the areas in which they will work and the institutions they will attend.

Specifically in respect to medicine, the Zook Commission predicted that by 1960 there will be an acute shortage of doctors. Quoting the Federal Security Agency, it asserted that the deficit will be at least 26,000 in 1960; if actual and urgent needs for better medical service are met, the shortage will be 56,000 doctors. To produce 56,000 doctors between now and 1960 will require that the annual output be doubled. (These remarks are parenthetical, and I return to the subject of federal aid to research.)

For perspective, I have calculated the total expenditures for educational purposes in 1939 of one hundred and fifty-nine universities and colleges, choosing all institutions which it seemed to me would conceivably participate in scientific training and research. The sum amounted to slightly over $300,000,000. The government's contribution of $250,000,000 for research in universities plus some undetermined figure for scholarships and fellowships would represent then nearly one half of the total educational budget in relevant schools.

Against this background, you can doubtless see why the issue of who should control a National Science Foundation has been of paramount importance, both to Washington and to scientists. The administration wants a Presidentially appointed director and a conventional inline government agency, while the majority of scientists want a nongovernmental board. The issue is perhaps one of the most important ever to be faced by science, or by the universities. (I have reported that Senator Smith and Mr. Wolverton are optimistic about reaching a suitable compromise in the next few weeks, but what that compromise will be cannot be said at this time.)

DANGERS STILL THREATENING ESTABLISHMENT OF FOUNDATION

As matters stand, there are still some technical dangers which threaten the establishment of a National Science Foundation. The new Interdepartmental Committee is now responsible for the expenditure of $500,000,000 of the $625,000,000 of government money. Assuming that the Interdepartmental Committee is not brought under the control of or made a part of the National Science Foundation, the latter may seem to Congress a relatively unimportant affair, and Congress may decide to put more money into the universities through existing government agencies rather than to create a new one. Or, with a large fraction of nondefense government money being spent by the Federal Security Agency, Congress may decide to increase the appropriation to that agency and let it take over all federal aid, other than defense, to the universities for all fields of science.

The aforementioned estimates of proposed federal aid to science and education may excite in you both happy anticipation and nervous alarm. I think one will do well not to take the figures too seriously. It seems doubtful that an economy-minded 80th Congress would appropriate more than a fraction of the sums mentioned. You will recall that against the $250,000,000 mentioned by Mr. Steelman as needed for university research of all kinds, and the $150,000,000 mentioned by Mr. Zook as needed for higher education of all kinds, the President modestly asked for $5,000,000 for a potential National Science Foundation for the coming fiscal year. This is only 1 per cent of the sums mentioned. We are at the moment in a phase when the national income is large, and money, to use the vulgar expression, is easy. We are enjoying the dubious blessings of a paternalistic federal government which is hopeful of solving most of our ills by legislative action and financial aid. But nothing in what I can glean from the crystal ball of the economists confirms me in the hope that our economic system is permanently stabilized beyond the danger of misadventure, that money will always be easy, that a paternalistic Congress will always sit in Washington, that we can always think in terms of a federal budget of $40,000,000,000, or that some day we may not have to wash test tubes ourselves, again.

It is frequently said that scientists are poor businessmen, owing to the fact that they live in ivory towers and breathe the rarefied air of intellectual abstraction. This may be true of physicists and chemists, for whom I cannot speak, but I challenge any Congressman, government official or businessman to make a dollar go farther than the average medical educator or medical researcher who has a genius for turning dollars into rubber, a genius which remains unrecognized by the Bureau of the Budget and other financial wizards.

You will recall that at the outbreak of the war the total annual budget of our 77 medical schools amounted to $26,000,000, only one quarter of what Mr. Steelman estimates is now spent on medical research and less than one tenth of what he recommends that we should spend. What proportion of our total budget we actually spent on research cannot be determined by any financial wizard for reasons that are clear to you all, but I would guess that it was not much in excess of one fifth, or about $5,000,000 per year, only one sixtieth of Mr. Steelman's optimal figure. Our annual expenditures for medical research have probably never exceeded this figure, and it was on this sum that American medicine forged to world leadership between 1900 and 1940.

When aiding Dr. Bush in the preparation of his report, "Science—the Endless Frontier," his Medical Committee made as thorough a study of the problem as was feasible in the few months available to them; and, partly on the basis of inquiries directed to all the deans of the medical colleges, as to how much money they could wisely use, the committee arrived at the recommendation that government aid to medical research, including fellowships, should take the form of $5,000,000 the first year, increasing over a period of five years to $15,000,000. I think that it was Bernard Shaw who said that you can never get the chill of poverty out of your bones. Clearly Dr. Bush's Medical Committee did not and do not yet know what $300,000,000 looks like.

In looking to the future, I look first to the past. Medical science owes its existence to the need to care for the sick and to the need to train new doctors to care for the sick. The care of the sick and the training of physicians is the black soil from which our medical science and the economic security of our medical scientists have come. Research has always been something of a dividend both for us and for society, one of the fruits of our service. This will possibly not always be true. I think it certain that in the near future we shall have federal aid in some form or other for medical research and education. But I foresee what seems to me to be a real danger. You can all recall the thirties when doctors of science were driving taxis in Germany, and you may have heard of the experienced restaurateur in New York who hung a sign in his window reading: "Dishwasher wanted. Must be Ph.D."

Except for temporary training fellowships, I tell my men that they must either take care of the sick or teach others how to do so. I assure them that about half of their time will be available for research, as an obligation to science and a dividend from society. So far, they seem to have liked this disposition of their lives, and their time has certainly been productively spent. They are poor, yes, but like Antaeus, the wrestler whose feet must remain implanted on the earth lest he lose his strength, they know their strength and whence it comes, and feel secure. I am not sure that by and large they could feel so secure, or could be as productive scientifically, if they did otherwise. But perhaps I am something of a pessimist, too much inclined to look down the horse's throat with a bronchoscope. You will doubtless discount this chronic ailment on my part in making your own assessments of the future.

Addendum: On March 25, 1948, a National Science Foundation Bill was introduced in the Senate (S. 2385)by Senator H. Alexander Smith for himself and Senators Cordon, Revercomb, Saltonstall, Thomas of Utah, Kilgore, Magnuson and Fulbright. An identical bill has been introduced in the House of Representatives, H. R. 6007, by Representative Charles A. Wolverton. The bill provides for a twenty-four member foundation, an Executive Committee of nine members and a director who is to be "appointed by the President, by and with the advice of the Senate, after receiving recommendations from the Foundation." The division of National Defense is eliminated, presumably because the Research and Development Board of the National Defense Establishment will supervise all fundamental military research. This makes the National Science Foundation a purely civilian organization. S. 2385 contains no provisions for the establishment of an Interdepartmental Committee on Science, presumably because such a committee has already been established by executive order. Apart from these changes, S. 2385 closely follows S. 526 introduced into the Eightieth Congress, First Session, and carries out the recommendations made by the various scientific groups who are interested in a National Science Foundation.

Clinical Notes, Suggestions and New Instruments

PENICILLIN IN TREATMENT OF WOUNDS INFLICTED BY A LION

ALEXANDER HERSHMAN KEMP, M.D.
Angola, Africa

For some years medical literature has been replete with reports of the use of penicillin for various types of infection, but so far as I know there has been no report of its use following a mauling of a person by a carnivorous animal. Hence the present report.

On the morning of Aug. 20, 1947 a man who had been mauled by a lion was brought to our mission hospital. The hospital is situated in West Central Africa, 9 degrees south of the equator, 300 miles inland from the west coast. There are lions, leopards, water buffaloes and other game in this region, and occasional victims of these animals are brought to our hospital for treatment. The staff consists of one American-trained doctor and an American nurse trained here, a typical "bush hospital."

Our present patient was a mulatto aged 43 years, robust of physique and a professional hunter by trade. He was heavily bandaged about the head, left arm and shoulder, and in a state of collapse. When he was able to talk he stated that about 8:30 on the previous morning he had been hunting about 160 kilometers (100 miles) distant from the hospital and about 20 kilometers (12 miles) from an automobile road. He had shot twice at a lion, hitting it with each shot. He claimed that he had used all precaution in approaching the spot where he had seen the lion drop, but he could not explain how the lion had made its surprise attack or whether it had used it teeth or claws or both in the attack. His companions came to his rescue, improvised a hammock and carried him to the automobile road, where a truck was secured to carry him to the nearest plantation, 25 kilometers distant, where he was given first aid. Another truck was then secured to take him 65 kilometers to a town, where a nurse redressed his wounds and gave him an injection of tetanus antitoxin. He was then brought to our hospital, 70 kilometers farther on, where he had been treated two months before for another condition.

The patient was in a state of shock peculiar to victims of attacks by wild animals, which was out of all proportion to what would be expected from similar wounds inflicted by machinery or in an automobile accident. Apparently he had been wounded only by the teeth of the lion, as all of the wounds were puncture wounds, not one being of a torn nature. When a leopard or lion uses its claws the wounds are like those made by a sharp razor, deep and cleancut. One tooth had cut downward through the left eyebrow and the edge of the upper lid. There were eleven wounds on the left arm, a similar number on the left side of the chest, three on the forearm and several on the shoulder. Apparently the animal had sprung on the victim and clamped his jaws several times without tearing the flesh, as sometimes happens. There had been considerable loss of blood, though the great prostration was probably not from this cause. The wounds were again dressed, this time with 1 per cent phenol solution, which is routine with us and has given satisfactory results with ordinary wounds such as those received in our carpentry shop. We applied penicillin ointment and gave the patient 5 Gm. of sulfathiozole by mouth in three doses and an injection of neoarsphenamine, 0.75 Gm., which is also routine with us, and morphine.

Our previous experience in treating wounds inflicted by wild animals has been in harmony with that cited by Castellani and Chalmers in their "Manual of Tropical Medicine."[1] Regardless of how thoroughly such wounds are debrided and cleansed, infection always follows, as the teeth and claws of such animals always are contaminated with various types of bacteria including the saprophytic. Cellulitis almost always and gangrene frequently follows because of this infection. I have never known a bite from a wild animal to heal by first intention, and usually a considerable period of time elapses before such wounds close.

Castellani and Chalmers recommended that all puncture wounds made by wild animals be opened widely for drainage, provided the condition of the patient allows this. The condition of our patient did not justify this. By the fourth day all of the wounds were discharging profusely, and the left hand was extremely edematous. We had been dressing the wounds daily and giving 3 Gm. of sulfathiozole daily. We then gave an injection of penicillin in oil and beeswax, 300,000 units, repeating this daily until a total of 1,500,000 units had been given. On the sixth day after the accident I gave another injection of neoarsphenamine, Gm. 60. The profuse discharge gradually lessened, and by September 15 had ceased.

About the fourth day of hospitalization a severe cough developed which prevented sleep day or night. The lungs showed no pathologic changes, which led me to believe that the cough was caused by the toxins of the infection. Four weeks after the accident the patient was discharged in good condition.

Judging by previous experience with wounds inflicted by wild animals, this patient would have had slight chance of recovery within six months of the accident, and it is highly probable that there would have been a fatal outcome. It was the universal opinion of our natives, and they have had much experience with such accidents, that the prognosis for this man was hopeless. I attribute his recovery, rapid and complete, to the penicillin.

Council on Pharmacy and Chemistry

NEW AND NONOFFICIAL REMEDIES

The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies. A copy of the rules on which the Council bases its action will be sent on application.

Austin Smith, M.D., *Secretary.*

FIBRIN FOAM.—A sterile, dry preparation of fibrin prepared from fraction I of citrated normal human plasma as fractionated by the method of Cohn (*J. Am. Chem. Soc.* **68**:459, 1946). It complies with the requirements of the National Institute of Health of the United States Public Health Service.

Actions and Uses.—Fibrin foam (human) acts as a mechanical coagulant and in combination with thrombin gives a chemical as well as a mechanical matrix for coagulation. It has been used in surgery of the brain, liver, kidneys and other organs where ordinary methods of hemostasis are ineffective or inadvisable.

Dosage.—Apply directly to oozing surface.

Tests and Standards.—

Fibrin foam (human) consists of small, yellowish, rectangular, fragile, spongelike pieces which become compressible and resilient when completely wetted with water. The loss in weight on drying a specimen of fibrin foam over phosphorus pentoxide in vacuo is not more than 5 per cent. The residue on ignition shall not exceed 8 per cent.

Peptic digestion of a 50 mg. piece of fibrin foam in 100 cc. of a 1 per cent solution of pepsin N. F. in tenth normal hydrochloric acid at 37 C. shall require less than thirty minutes.

Cutter Laboratories, Berkeley, Calif.

Fibrin Foam and Thrombin (Human): Packages containing a 250 mg. (6.25 to 12.55 cc.) jar of fibrin foam, a vial of thrombin (human) containing not less than 200 units and a 20 cc. vial of isotonic sodium chloride solution.

The thrombin supplied meets the requirements of the National Institute of Health of the United States Public Health Service and is derived from human plasma.

Licensed by Research Corporation under U.S. Patent 2,389,074.

APPROVED INTERNSHIPS AND RESIDENCIES IN THE UNITED STATES

ANNUAL REPORT ON INTERNSHIPS AND RESIDENCIES BY THE COUNCIL ON MEDICAL EDUCATION AND HOSPITALS OF THE AMERICAN MEDICAL ASSOCIATION

F. H. Arestad, M.D., E. K. Reid, M.D., and E. H. Leveroos, M.D.

The approved internship and residency lists previously published in August of each year are now appearing for the first time in a special Internship and Residency Number of THE JOURNAL. The transfer of these lists from the August Educational Number of THE JOURNAL to the earlier publication date has been made so that information on educational services may be available at a more convenient time to those who, later in the year, will be seeking internship and residency appointments for 1949.

The present internship list contains the names of all hospitals approved by the Council for intern training as of April 1, 1948. These hospitals are listed alphabetically by city and state and show also the type of ownership or control, bed capacity, number of patients admitted, percentage of service cases, percentage of private patients assigned to interns, type of internships offered, length of training, number of internships available, affiliated assignments, outpatient service, necropsy percentage, monthly stipend and date of internship assignment. In the present list for the first time indication appears of internship hospitals affiliated with individual medical schools as (1) a major unit in the school's teaching program or (2) a limited assignment for undergraduate clinical clerkships. Various factors relating to hospital internships are described in subsequent sections of the report, which includes a special study on the supply and distribution of interns.

The residency list includes all hospitals approved by the American Medical Association for residency training as of April 1, 1948. The hospitals are listed in accordance with individual specialties and show in connection with each training program the chief of service, the volume of teaching material available, number of residencies offered, length of training, date of residency assignment and monthly stipend. In the fields in which specialty Boards have been established, it is indicated in the corresponding sections of the list that the residencies approved by the Council are likewise acceptable to the respective Boards.

Grateful acknowledgment is made to the individual internship and residency hospitals, the medical schools, the specialty Boards, the Army, Navy, United States Public Health Service, Veterans Administration, the hospital administrators, educational directors, staff physicians and other personnel whose generous cooperation has made possible the preparation and publication of these lists.

Number of Internships

As of April 1, 1948, 798 hospitals in the United States were approved for intern training, as well as 9 outside the country. Those listed include 41 under federal control, 120 under governmental control other than federal, 16 proprietary institutions, 295 church sponsored, and 335 non-profit associations. They offer a total of 9,118 internships including 16 in the Canal Zone, 18 in Puerto Rico and 26 in Hawaii. These are not all available annually, however, since 979 of the total number are for periods in excess of twelve months. Since the publication of the Educational Number, August 16, 1947, the Council on Medical Education and Hospitals has approved 17 new hospitals.

In the federally controlled group, the U.S. Army now offers 108 internships, the U.S. Navy 117, the U.S. Public Health Service 115 and the Federal Security Agency 30.

In the publication of the list of hospitals approved for intern training, teaching hospitals have been identified this year for the first time. For purposes of this list, a hospital has been designated as a teaching hospital if its inpatient services are used by junior or senior medical students for clinical clerkships. A reference note indicates the medical school or schools with which the hospital is affiliated.

Internship Vacancies

For many years the number of approved internships has been greater than the number of physicians graduated annually. Prior to the war, however, relatively few approved internships were not filled. During the war certain dislocations in the supply and distribution of interns were inevitable. With the end of the war, however, a full return to the prewar pattern of the supply and distribution of interns did not occur, and considerable attention has been centered during the past two years on the fact that a number of approved internships have remained vacant. Because of the general interest in this problem, statistics with respect to vacant or unfilled internships for the current year, and for 1944 and 1939 have been analyzed. The important findings of this analysis are summarized below under several headings, including the number of internships vacant; the number of hospitals having internship vacancies, and the number of admissions per intern.

Table. 1.--*Approved Hospitals, Internships and Medical School Graduates 1938-1948*

Year*	Number of Hospitals	Number of Internships	Number of Graduates
1938	729	7,354	5,194
1939	734	7,833	5,089
1940	732	7,998	5,097
1941	735	8,182	5,275

Number and Distribution of Internship Vacancies

The gradual increase in the number of approved internships during the past ten years is shown in table 1. The number of graduates has increased by 12 per cent.

The distribution by states of the number of internships and interns on duty is shown in table 2[1] New Hampshire, offering a relatively small number of internships, reported no vacancies. Of those states offering 100 or more internships, Minnesota showed the lowest percentage of vacancy, 6.9 percent, with California and Georgia next, both indicating vacancies of 10.5 percent. Conversely, Maine showed the highest percentage of vacancies, 79.1 percent, and Montana the next highest, 71.4 percent; these two states together offered a total of 31 internships. Of those states listing 100 or more internships available, Indiana indicated the greatest percentage of vacancy, 32 percent; New Jersey and Ohio followed with 28.4 percent and 28.2 percent, respectively.

The annual demand for interns has been increased not only by the establishment of additional internships but also by the fact that a much greater proportion of the internships are now offered for a one year period only. In 1939 there were 1,738 internships of over one year's duration while in 1948 the number of such internships is only 979. The decline in the number of the longer type internships is attributable in part to the fact that more physicians enter residency training after the first year of internship, with a consequent lessening of demand for the two year plans, and to the fact that some hospitals have been unable as yet to convert from their shorter wartime programs. Further analysis of the data listed in table 2 reveals that the teaching group offered 46.8 percent of the total number of internships while the non-teaching group accounted for 53.2 percent. Teaching hospitals reported 8.6 percent of their positions unfilled, while 32.2 percent of the positions in the non-teaching group were vacant. To recapitulate, there were 8,609 internships offered in the hospitals included in this group, 4,034 in the teaching institutions and 4,575 in the other; 6,902, or 80 percent of these were filled, with 3,709 interns on duty in the teaching hospitals and 3,193 in the non-teaching group. Vacancies number 1,781 with 348 in the former hospitals and 1,433 in the latter; the over-all percentage of vacancies was 20 percent.

Table 2.--*Internships Available and Interns Assigned by States (1947-1948).**

*Includes 748 of 807 hospitals approved; excludes Federal hospitals, those outside the United States and 22 others.
**27 hospitals had 74 interns assigned in excess of number offered.

Number of Hospitals Affected by Internship Vacancies

Charts 1 and 2 present the problem of internship vacancies from the standpoint of the number of hospitals involved and the degree to which they are affected. Hospitals presently classified as teaching are similarly grouped in the 1939 and 1944 data. In 1939, 78.5 percent of 704 approved hospitals had full complements of interns with only 1.7 percent of the teaching hospitals and 6.0 percent of the non-teaching hospitals having less than half of their internships filled. By 1944, the number of hospitals having all assignments filled had decreased to 62.4 percent. Hospitals with vacancies in excess of one half the number available had increased to 7.8 percent of those classified as teaching and to 20.9 percent of the others. Currently, only 33 percent of the number of hospitals with intern programs have complete intern staffs; 9.7 percent of the teaching hospitals and 30.2 percent of the nonteaching group have less than half their required number of interns. A further breakdown of these data indicates that, in 1948, when one third of all hospitals in the survey group reported no vacancies, an additional 22 percent reported that at least three-fourths of their positions were filled. Twenty percent had between one half and three fourths of their full quota, and 25 percent had less than half their internships filled, including 87 hospitals reporting no interns; and of this group, 57 had one or more residents assigned. Of the entire group of hospitals surveyed, therefore, only 30 hospitals were without interns or residents during the past year. It is evident that a direct correlation exists between the size of a hospital and the proportion of intern vacancies. Data presented numerically in table 3 and graphically in chart 2 demonstrate the increased concentration of interns in larger hospitals. In 1939 when intern vacancies were relatively few, a fairly equable distribution was evident among hospitals of various sizes; any inequality was confined to those of 150 beds or less and even this was slight. At the present time, however, with the vacancy problem of greater proportions, the smaller hospitals have been considerably more affected. In the 450 bed and over category, 54.8 percent reported they had their full intern complement while less than 2 percent reported vacancies in excess of one half those offered. Hospitals of 150 beds and under, however, had only 29.3 percent reporting no vacancies, with 37.5 percent showing vacancies of more than one-half those available. The inverse proportion between size of hospital (i.e., bed capacity) and internship vacancies is fairly constant for all four groups.

---

[1] Data for 1947-1948 presented in the text, charts 1 and 2 and tables 2 to 5 include 185 teaching and 563 non-teaching hospitals furnishing sufficient information for statistical analysis.

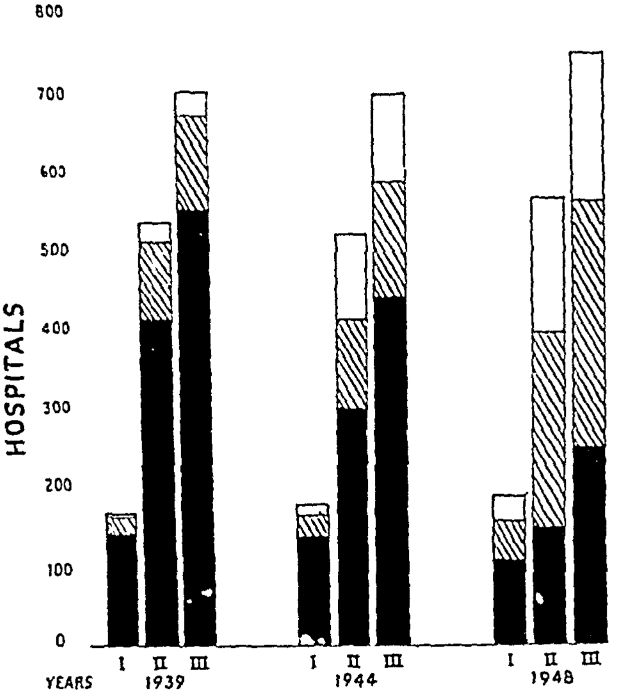

Chart 1.—Number of approved hospitals and percentage of vacancies, 1939-1944-1948: I, teaching hospital; II, nonteaching hospital; III, combined. The white portion of the column indicates 51 to 100 per cent vacancies; the shaded portion, 1 to 50 per cent vacancies, and the black portion, no vacancies.

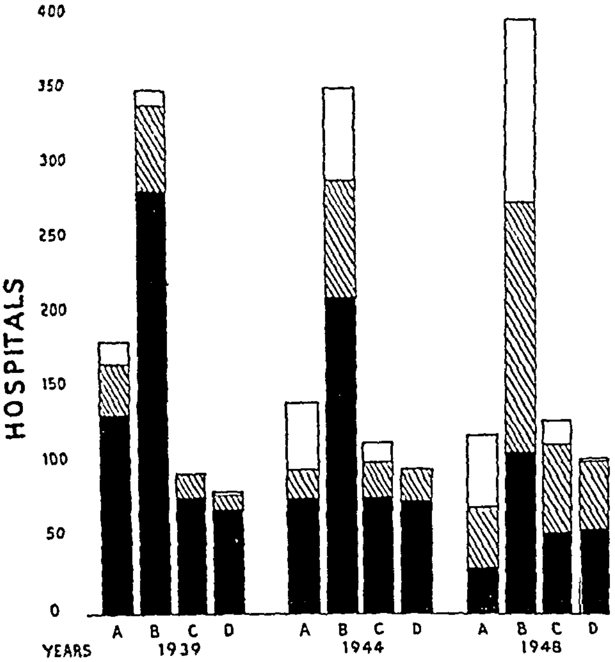

Chart 2.—Internship vacancies correlated with bed capacity, 1939-1944-1948: A, 150 beds or less; B, 151 to 300 beds; C, 301 to 450 beds, and D, 451 beds and over. The white portion of the column indicates 51 to 100 per cent vacancies; the shaded portion; 1 to 50 per cent vacancies, and the black portion, no vacancies.

To summarize, from the data presented in charts 1 and 2 it is apparent that under the existing conditions in which the number of internships in hospitals approved for training exceeds the number of interns available, a fairly broad distribution of interns obtains. However, it can be seen that an increasingly higher proportion of the interns available are accepting appointments in the larger hospitals and those affiliated with medical schools.

Ratio of Interns on Duty to Annual Admissions

A further pertinent consideration in evaluating intern vacancies is that of hospital admissions. It is apparent that with an increase in the number of annual admissions, an approved hospital will require additional interns.

Data covering hospital admissions for the three years under consideration are contained in table 4. Average admissions per hospital for both groups increased by 35 per cent from 1939 to 1948, with an increase in the teaching group of 28 per cent and an increase of 38 per cent for the non-teaching hospitals. In

*Hospitals classified as teaching in 1948 are similarly grouped in 1939 and 1944.

addition to the increased number of admissions per hospital, there was an appreciable drop in the number of interns on duty in the non-teaching hospitals. As a consequence, the number of admissions per intern, in this group, has increased by approximately 70 per cent. In the teaching hospitals, it has increased by about 25 per cent during the same period. In 1939 the number of admissions per intern in the non-teaching hospitals exceeded that for the teaching group by 19 per cent, while in 1948, this had increased to 105 per cent. The apparent disproportion of interns in teaching hospitals, however, must be considered in the light of the duties involved and the number of patients with which the intern is directly concerned. In the smaller non-teaching hospitals many of the patients admitted are not available to the intern for instructional purposes. While many such hospitals list the majority of all private patients as available for intern training, the degree to which the intern is responsible for this type of patient varies markedly. Additional demands on the intern's time in a teaching hospital also affects the number of admissions for which he can assume responsibility.

In summary, it is apparent that many factors enter into the consideration of internship vacancies: the increased intern requirements of Army and Navy hospitals, the increased number of hospitals approved for intern training, the decrease in the number of 18 months' and 24 months' internships, the trend towards beginning residency training after one year of internship, and the apparent concentration of interns in hospitals of larger size as well as in teaching institutions.

The effect of the war on the pattern of the supply and distribution has not been entirely removed. In the last six months of 1947 approximately 3,000 men who had completed their first year of internship were called to active duty in the armed services and were not available for a second year of internship. Until more stabilization has been achieved, it will be difficult to evaluate the relative importance of the factors listed above in contributing to the problem of internship vacancies.

Table 5.--*Autopsy Percentage*

	20%-less	21-30	31-40	41-50	51-60	61-70	71-80	81%-over	Total
Teaching Hospitals	9	25	29	48	35	22	9	8	185
Non-teaching Hospitals	69	154	116	103	65	32	13	1	563

Autopsies

Autopsy percentages of hospitals included in the 1948 survey group are given in table 5. The majority of hospitals approved had little difficulty in meeting the minimum requirement of 15 percent. Of the teaching hospitals, 122 (66 percent) had rates of 40 percent or over; in the non-teaching group, 214 (38 percent) were able to maintain a rate of this level. Again, in the teaching group, less than 5 percent (9 hospitals) indicated rates of 20 percent or below; 12 percent (69 hospitals) of the non-teaching group were below 20 percent. There was some degree of correlation between vacancies and autopsy percentages, with hospitals having lower autopsy rates showing a greater percentage of vacancies; 45 (57 percent) of the non-teaching hospitals without interns had an autopsy rate of 30 percent or loser; 106 (74 percent) of the non-teaching group having no internship vacancies had autopsy rates in excess of 30 percent.

Stipend

Data concerning monthly stipends are available for 738 of the hospitals studied. Of this group, 60 teaching and 24 non-teaching hospitals (11 percent) paid no stipend; 98 teaching and 240 non-teaching (46 percent) paid $50.00 or less; an additional 265 (36 percent) offered amounts from $51.00 to $100.00 while 51 hospitals (7 percent) stipulated amounts in excess of $100.00.

Facilities for Residency Training

Hospital facilities for the training of resident physicians have increased tremendously in recent years. Compared with 1941, when 5,256 residencies were available, the present total of 15,172 as of April 1, 1948 represents an increase of nearly 200 per cent. These services include 12,402 approved residencies in nonfederal hospitals and 2,770 in the federal group, including 2,118 in hospitals operated by the Veterans Administration. The number of hospitals currently approved by the American Medical Association for residency training is 1,102. However, many institutions offer training in several fields and thus a total of 3,737 separate programs are represented in the list of Approved Residencies and Fellowships published in this issue of THE JOURNAL.

The list of approved residencies is divided into twenty-seven groups classified alphabetically according to field of training. The individual hospitals in each group are listed alphabetically by city and state and show also the chief of service, the volume of teaching material available, necropsy percentage. number of residencies offered. date of residency assignment, length of training and monthly stipend. In the sixteen fields in which specialty boards have been established, it is indicated in the corresponding sections of the list that the residencies approved by the Council are likewise acceptable to the respective Boards. This designation of Board acceptance is shown in relation to (1) anesthesiology, (2) dermatology and syphilology, (3) internal medicine, including allergy, cardiovascular disease, gastroenterology and pulmonary diseases, (4) neurologic surgery, (5) obstetrics and gynecology, (6) ophthalmology, (7) orthopedic surgery, (8) otolaryngology, (9) pathology, (10) pediatrics, (11) physical medicine, (12) plastic surgery, (13) psychiatry and neurology, (14) radiology, (15) surgery and (16) urology.

It should also be noted that the number of years of credit allotted by various specialty boards is indicated in the residency list by footnotes 1 to 3 included immediately after the name of the hospital. This information is furnished in the fields of dermatology and syphilology, neurology, obstetrics and gynecology, orthopedics, pathology, pediatrics, psychiatry, radiology and urology. It is anticipated that in the near future similar information will also be available in relation to other specialties.

While there is no certification in contagious diseases, as such, training credit for six months in approved residencies in this field may be granted by the American Boards of Internal Medicine and Pediatrics. Similarly, in malignant diseases some credit toward eligibility for the certification examinations may be granted by the American Boards of Surgery, Pathology and Radiology. The American Board of Surgery has indicated that two years of training credit may be allowed for work in an approved residency in one of the more specialized fields of surgery, such as neurologic surgery, plastic surgery or thoracic surgery. General residencies, which represent general hospital assignments of one or more years after the internship, do not, as a rule, carry credit toward certification by the specialty boards. A separate residency classification has recently been established in occupational medicine, and institutions desiring residency approval in this field should apply directly to the Council on Medical Education and Hospitals.

All of the specialty boards are cooperating with the Council on Medical Education and Hospitals in the evaluation of residencies in their respective fields. This program of cooperative study and appraisal of educational services was inaugurated in 1939 and has proved highly successful not only in the evaluation and approval of individual hospitals, but also in the development of uniform standards and the establishment of residency lists equally acceptable to the Council and the respective specialty boards.

Toward the end of the war large numbers of applications were submitted by hospitals seeking to meet the increased demand for residency training. In response to this need, the Council, in collaboration with the Advisory Board for Medical Specialties, instituted in 1946 a plan for the temporary approval of residencies so that new, well organized educational programs might be available to physician-veterans without undue delay.

Number Of Residencies Available

The number and distribution of approved residencies may be observed in the accompanying table. General surgery offers the greatest number of residencies, 2,977 in all, whereas internal medicine has 2,880 not counting 47 in allergy, 55 in cardiovascular disease, 3 in gastroenterology and 418 in pulmonary diseases. With reference to gastroenterology, it should be noted that only recently was a separate residency classification established in this field. Psychiatry can accommodate 1,618 applicants, obstetrics and gynecology 1,145, radiology 833, pathology 794, pediatrics 791, ophthalmology and otolaryngology 738, orthopedics 718, anesthesiology 487, pulmonary diseases 418 and urology 407. The degree of expansion in the various fields is readily apparent when the present totals are compared with the corresponding figures for 1941. Reference should also be made to the sections on Internships and Residencies published in THE JOURNAL, April 12, 1947, pages 1078-1082, and August 16, 1947, pages 1318-1320.

* Number of residency programs in 1,102 hospitals approved for residency training.

Residencies in Federal Hospitals

Well organized educational programs for resident physicians have been developed by the Army, Navy, U.S. Public Health Service and the Veterans Administration. The Army, which can accommodate 334 residents in nine approved general hospitals, has at present 268 in training with 75 additional medical officers holding residency assignments in civilian hospitals. Fifteen Naval hospitals are approved for residency training. Twelve approved hospitals of the U.S. Public Health Service can accommodate 125 resident physicians. The Veterans Administration has facilities for 2,118 residents in seventy hospitals approved by the Council for residency training.

APPROVED INTERNSHIPS

Council on Medical Education and Hospitals of the American Medical Association

535 North Dearborn Street, Chicago 10

Revised to May 1, 1948

HOSPITALS, 807 INTERNSHIPS, 9,118

The following general hospitals, investigated and approved by the Council on Medical Education and Hospitals, are considered in position to furnish acceptable intern training in accordance with standards adopted by the American Medical Association. Three types of internships are approved by the Council—rotating, mixed and straight:

1. A rotating internship is defined as one which provides supervised experience in internal medicine, surgery, pediatrics, obstetrics and their related subspecialties, together with experience in laboratory and radiologic diagnosis.

2. A mixed internship is defined as one which provides supervised experience in two or more, but not in all, of the clinical divisions named.

3. A straight internship is defined as one which provides supervised experience in a single department, although it may include limited opportunity for work in a related subspecialty. Straight internships are now approved in internal medicine, surgery, pediatrics, obstetrics (with or without gynecology) and pathology.

Hospitals approved for internships that are used by medical schools for undergraduate clinical clerkships on inpatient services have been identified in the following lists by the symbols X and x. Hospitals have been identified with symbol X when a medical school has indicated that the hospital is a major unit in the school's teaching program. Hospitals have been identified with the symbol x when a medical school has indicated that the hospital is used to a limited extent in the school's teaching program. Certain internships in hospitals designated as teaching hospitals may not provide for assignments to teaching services. Other internships may provide for only a portion of the internship period being spent on teaching services. Prospective interns desiring specific information concerning internship assignments to teaching services in a hospital are advised to communicate with the dean of the medical school with which the hospital is affiliated. Medical school affiliations are indicated by footnotes 10 to 79 placed immediately after the symbol X or x. The list of medical schools appears on page 40.

The hospitals approved for intern training are likewise accredited for general residencies which represent general house staff assignments following the internship. The plus (+) sign indicates additional approval for residencies in specialties, as shown in the Council's list of Approved Residencies and Fellowships for Veteran and Civilian Physicians.

HOSPITALS APPROVED FOR INTERNSHIPS IN THE DOMINION OF CANADA

For the benefit of graduates of approved medical colleges who desire an internship in Canada, the Council on Medical Education and Hospitals of the American Medical Association has declared that hospitals which conform to the standards of the Canadian Medical Association should be regarded as giving an internship equivalent in educational value to that offered by hospitals in the United States approved for intern training by the Council. It is understood, however, that this statement applies only to hospitals that are unqualifiedly "Approved" under the Canadian plan and does not apply to that group referred to as "Commended."

The following list of hospitals, revised to April 1, 1947, has been furnished by the Canadian Medical Association.

Name of Hospital	Location
Camp Hill Hospital	Halifax, N. S.
Victoria General Hospital	Halifax, N. S.
St. John General Hospital	St. John, N. B.
Hospital du St. Sacrament	Quebec, Que.
Hospital Dieu de Quebec	Quebec, Que.
Hospital of the Infant Jesus	Quebec, Que.
Jeffrey Hale's Hospital	Quebec, Que.
Children's Memorial Hospital	Montreal, Que.
Herbert Reddy Mem. Hospital	Montreal, Que.
Homeopathic Hospital	Montreal, Que.
Hospital Notre Dame	Montreal, Que.
Hospital Ste. Jeanne d'Arc	Montreal, Que.
Hospital Ste. Justine	Montreal, Que.
Hotel Dieu de Montreal	Montreal, Que.
Hospital Ste. Luc	Montreal, Que.
Jewish General Hospital	Montreal, Que.
Montreal General Hospital	Montreal, Que.
Queen Mary Veterans Hospital	Montreal, Que.
Royal Victoria Hospital	Montreal, Que.
St. Mary's Hospital	Montreal, Que.
Ste. Anne's Hospital	Ste. Anne de Bellevue, Que.
Brantford General Hospital	Brantford, Ont.
Hamilton General Hospital	Hamilton, Ont.
St. Joseph's Hospital	Hamilton, Ont.
St. Joseph's Hospital	London, Ont.
Victoria Hospital	London, Ont.
Westminster Hospital	London, Ont.
Oshawa General Hospital	Oshawa, Ont.
Ottawa Civic Hospital	Ottawa, Ont.
Ottawa General Hospital	Ottawa, Ont.
Hotel Dieu Hospital	Kingston, Ont.
Kingston General Hospital	Kingston, Ont.
Christie Street Hospital	Toronto, Ont.
Hospital for Sick Children	Toronto, Ont.
Mount Sinai Hospital	Toronto, Ont.
St. Joseph's Hospital	Toronto, Ont.
St. Michael's Hospital	Toronto, Ont.
Toronto East General Hospital	Toronto, Ont.
Toronto General Hospital	Toronto, Ont.
Toronto Western Hospital	Toronto, Ont.
Wellesley Hospital	Toronto, Ont.
Women's College Hospital	Toronto, Ont.
Grace Hospital	Windsor, Ont.
Metropolitan Hospital	Windsor, Ont.
Hotel Dieu of St. Joseph	Windsor, Ont.
Children's Hospital	Winnipeg, Man.
Deer Lodge Hospital	Winnipeg, Man.
Misericordia Hospital	Winnipeg, Man.
Winnipeg General Hospital	Winnipeg, Man.
St. Boniface Hospital	St. Boniface, Man.
Regina Grey Nun's Hospital	Regina, Sask.
Regina General Hospital	Regina, Sask.
St. Paul's Hospital	Saskatoon, Sask.
Saskatoon City Hospital	Saskatoon, Sask.
Calgary General Hospital	Calgary, Alta.
Colonel Belcher Hospital	Calgary, Alta.
Holy Cross Hospital	Calgary, Alta.
Edmonton General Hospital	Edmonton, Alta.
Misericordia Hospital	Edmonton, Alta.
Royal Alexandra Hospital	Edmonton, Alta.
University of Alberta Hosp.	Edmonton, Alta.
St. Paul's Hospital	Vancouver, B. C.
Shaughnessy Hospital	Vancouver, B. C.
Vancouver General Hospital	Vancouver, B. C.
Royal Jubilee Hospital	Victoria, B. C.
St. Joseph's Hospital	Victoria, B. C.

APPROVED RESIDENCES AND FELLOWSHIPS

Council on Medical Education and Hospitals of the American Medical Association
535 North Dearborn Street, Chicago 10

Revised to May 1, 1948

Hospitals, 1,102; Assistant Residencies, Residencies and Fellowships, 15,172

The following educational services investigated and approved by the Council on Medical Education and Hospitals are considered in position to furnish acceptable residency training in accordance with standards adopted by the American Medical Association. In practically all fields these training programs have been reviewed in collaboration with the respective specialty boards. Included in the present list is the expanded number of residencies now available in those approved hospitals which have completed their plans to provide further opportunities for discharged medical officers. Many additional residencies recently organized or in process of development may soon be added to the approved list. All arrangements for appointments should be *made directly with the hospital concerned in the usual manner.*

The star (*) indicates hospitals that are also approved for the training of interns. All hospitals on the approved intern list are likewise accredited for general residencies which represent general house staff assignments following the internship.

The dagger (†) represents temporary approval, *pending formal inspection,* in accordance with the plan for the temporary approval of residencies in specialties as announced in The Journal A. M. A., March 2, 1946, p. 586.

INDEX TO LIST

Page
1. Allergy 42
2. Anesthesiology 42
3. Cardiovascular disease 44
4. Contagious diseases 44
5. Dermatology and syphilology 45
6. Gastroenterology 46
7. General residency 46
8. Internal medicine 47
9. Malignant diseases 52

†Lenox Hill Hospital★	New York City	H. Rafsky	178	.....	9	4	1	Varies	1-2	50.00

7. GENERAL RESIDENCY

A general residency (also called a "mixed residency") is a general hospital assignment of one or more years after the internship. It usually does not carry credit toward certification by the American Boards in the specialties, but is designed rather to provide additional general training. All approved internship hospitals are also approved for general residencies.

Hospitals, 90; Assistant Residencies and Residencies, 269

Name of Hospital	Location	Chief of Service	Inpatients Treated[6]	Deaths	Autopsies	Asst. Res. and Residencies Offered[8]	Beginning of Service (1948)	Length of Service Offered (Years)	Beginning Stipend (Month)

25. SURGERY

The following services are approved by the Council and the American Board of Surgery. This approval extends to July 1, 1950. In the meantime these services will be reviewed in collaboration with the American Board of Surgery to determine whether approval will be continued beyond that date and to determine the number of years of training *in individual approved hospitals that will be accepted as preparation for examination by the American Board of Surgery.*

THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION

535 North Dearborn Street - - Chicago 10, Ill.

Cable Address - - - - "Medic, Chicago"

Subscription price - - - - - Twelve dollars per annum in advance

Please send in promptly notice of change of address, giving both old and new; always state whether the change is temporary or permanent. Such notice should mention all journals received from this office. Important information regarding contributions will be found on second advertising page following reading matter.

SATURDAY, MAY 1, 1948

EDITORIAL ANNOUNCEMENT

The absence of the compositors from their work continues. This issue of THE JOURNAL has been prepared in part by the use of Vari-Typer machines.

ANNUAL REPORT ON INTERNSHIPS AND RESIDENCIES

The annual internship and residency report of the Council on Medical Education and Hospitals previously published in August of each year is now for the first time presented in a special Internship and Residency Number of THE JOURNAL. This change has been made so that information on educational services may be available at an earlier date to those seeking internship and residency appointments for 1949.

The report lists 807 hospitals approved for intern training which offer at present a total of 9,118 internships. An innovation in connection with this list is the identification of hospitals that are affiliated with medical schools for undergraduate clinical clerkships. This information should be of considerable interest to prospective interns.

Once again a significant increase in the number of residencies approved by the Council on Medical Education and Hospitals has been recorded. The present number of residencies in 1,102 approved hospitals is 15,172 as compared with 5,256 in 1941 and 1,776 in 1927, when the first residency list was prepared by the Council. Thus in a period of twenty years the residencies approved by the American Medical Association have increased nearly ninefold. The greatest expansion, however, has occurred in the last seven years in order to meet the accumulated needs of the wartime period. Both federal and nonfederal hospitals have participated generously in the development of new residency training programs. The nonfederal hospitals can at the present time accommodate 12,402 resident physicians, while the hospitals of the Army, Navy, U.S. Public Health Service and Veterans Administration provide facilities for 2,770.

The greatest number of residencies, 2,977 in all, is in the field of general surgery, whereas internal medicine reports a total of 2,880 not counting the residencies available in the related divisions of allergy, cardiovascular disease, gastroenterology and pulmonary diseases. Psychiatry has 1,618 residencies, obstetrics and gynecology 1,145, radiology 833, pathology 794, pediatrics 791, orthopedic surgery 718, anesthesiology 487 and urology 407. Other divisions represented in the lists of Approved Residencies and Fellowships likewise show a decided increase in the number of residencies available as compared with previous reports.

Although the number of residencies have increased by nearly 200 per cent since 1941, there is not yet any clear indication that a saturation point will soon be reached. Apparently the number of requests for residency approval is beginning to diminish, yet new applications are still being received by the Council on Medical Education and Hospitals at the rate of approximately two a day.

Applications for residency approval are reviewed in collaboration with the respective specialty boards, all of which cooperate with the Council in the evaluation of educational programs. Under this cooperative plan all residencies approved by the American Medical Association are likewise acceptable to the specialty boards in their respective fields.

THE SUPPLY AND DISTRIBUTION OF INTERNS

The analysis of current trends in the supply and distribution of interns presented in the Annual Report of Approved Internships and Residencies, prepared by the Council on Medical Education and Hospitals and published in this issue of THE JOURNAL, should interest all who administer or participate in internship programs.

The primary purpose of internship is to provide additional educational experience for the recent medical school graduate. However, the value of the service that an intern contributes to a hospital has become so widely appreciated that more and more hospitals have undertaken to develop approved internship programs, often at considerable expense. As a consequence, the ratio of the number of available internships to the number of interns seeking appointments has been completely reversed during the past thirty years. From a period when only a few of the larger metropolitan hospitals offered a limited number of internships and when only a fortunate few could obtain such training, the number of internships has gradually increased to the point where almost 2,000 internships remain unfilled each year.

Until the beginning of World War II a fairly satisfactory balance was maintained between the number of internships and the number of interns available. In 1939 almost 80 per cent of the approved hospitals had their full complement of interns. In contrast, during the current year only 33 per cent of the hospitals have obtained their full number of interns while 25 per cent have less than half their internships filled. One half of this latter group, or 12.5 per cent of all the approved hospitals, report that they have been unable to secure any interns during the past year, although the majority do have residents.

The detailed breakdown of the current distribution of interns reveals that the large hospitals and those institutions affiliated with medical schools are most successful in attracting interns. Least successful are the small nonteaching hospitals. These results are not surprising, since interns will usually seek appointments in those hospitals that give promise of offering the best educational experience as judged by the quantity and diversity of clinical material available and by the quality of the supervision provided. Confirmation of the belief that the opportunity for training rather than other considerations is the factor that influences interns most in the choice of a hospital is found in the fact that internship vacancies are considerably higher in those hospitals offering large stipends than in those that do not offer a stipend.

The problem of how to maintain a balance between the number of interns and the number of internships available is not easy to solve, particularly at this time when the effect of the war on the pattern of the supply and distribution of interns has not been entirely removed. Any attempt to accomplish a more even distribution of the available supply of interns by establishing quotas would be difficult, if not impossible, to enforce. Further, it would have the undesirable feature of denying interns the right to seek appointments in the hospitals with better educational programs up to the capacity of such hospitals to train interns effectively. Such a policy would be definitely contrary to the purpose and philosophy that underlies the internship.

Another possible solution would be arbitrary limitation of the number of hospitals that could be approved for internships at any one time. This type of quota would be distasteful because it would discourage free enterprise and competition among hospitals.

The time is probably not yet ripe to attempt any radical solution; eventually the problem may correct itself. For the first time in seven years, none of the current group of first year interns are under obligation to enter military service on the completion of one year or less of internship. Presumably some of these men will seek a second year of internship or its equivalent, the general residency. More hospitals than have done so already may be expected to return in the next year or so to their prewar policy of offering internships of more than one year's duration. Such a development would lead to a decrease in the total annual demand for interns. Finally, hospitals that persistently fail to secure interns will have to face the fact that for one reason or another they are unable to compete successfully with other hospitals in obtaining interns and that they must of necessity consider other methods for securing full time house officers.

In the present situation a hospital should not seek to initiate an internship training program unless a realistic evaluation presents convincing evidence that it will be of sufficiently high quality to constitute a real attraction to prospective interns. Hospitals with programs that meet only minimal standards will probably not be able to obtain interns, and hospitals that offer such programs will experience considerable disappointment when their internships are not sought.

THE THYROID AND VITAMIN A

Some six years after the announcement of the discovery of vitamin A, attention was called [1] to striking parallelism between the activity of vitamin A and the natural yellow color in plant sources of this food factor. Thus rutabagas, sweet potatoes and even yellow daffodils were shown to be superior in protecting experimental animals against the sequels of vitamin A deficiency than are the nonyellow varieties of the same plants. Later the yellowness was shown to be due to several hydrocarbon pigments that occur naturally in plants; alpha, beta and gamma carotene and cryptoxanthine are examples of this type of pigment which have come to be known as provitamins A. Obviously, carotene is transformed into vitamin A in the animal body, for when this pigment is fed, there results an accumulation of vitamin A. This circumstance, together with the fact that the liver is the most important site of storage of vitamin A in the body, has led to the ready assumption that the locus of transformation of carotene to vitamin A is the liver. That this view is open to question has been pointed out recently.[2] In any case, it is desirable to know the factors that influence this change.

---

[1] Steenbock, H.: Science 50: 352, 1919.

The older clinical literature recounts repeated instances which indicate that the activity of the thyroid gland is in some way involved in the carotene-vitamin A relationship. Thus it has been demonstrated that carotene accumulates in the milk after thyroidectomy;[3] the cretin shows inability to change carotene to vitamin A;[4] carotinemia is frequently encountered in patients showing clinical and laboratory signs of hypothyroidism;[5] patients with untreated myxedema are likely to have high levels of carotene in the blood,[6] and animals treated with antithyroid drugs like thiouracil give evidence of vitamin A deficiency despite adequate amounts of carotene in the diet.[7] A recent report[8] has submitted the thesis to further experimental study; after demonstrating again the effectiveness of carotene to replace vitamin A in the ration, it was shown that after thyroidectomy carotene failed to protect against xerophthalmia, whereas preformed vitamin A did exert the expected protective action. Similarly, Johnson and Baumann[9] have demonstrated that the storage of vitamin A in the liver and kidneys is minimal when thiouracil and thiourea are present in the diet with carotene, but not when the vitamin itself is given. The addition of thyroxin to these diets again permits the change of carotene to vitamin A.

In postulating a mechanism for the promoting action of thyroid hormone in the change of carotene to vitamin A, the calorigenic activity of thyroxin comes to mind. However, the Wisconsin investigators[9] have shown that this action is a specific function of the thyroid, as the increased basal metabolic rate produced by 2,4-dinitrophenol did not influence the foregoing phenomenon. The significance of further definitive data on the mechanism of this influence of the thyroid is readily appreciated when one considers that a large part of the daily intake of vitamin A potency may be in the form of the precursor, carotene, and that the effects of a deficiency of this essential food factor results in severe tissue damage and widespread functional derangement.

CONTAMINATED DEXTROSE SOLUTION--A WARNING

On April 19 the headquarters of the American Medical Association received a wire from Dr. W.F. O'Donnell Jr. of Hazard, Ky., reporting serious reactions in 2 patients immediately following the intravenous use of 5 per cent dextrose in normal saline solution manufactured by Cutter Laboratories, Berkeley, Calif. The product bore a control number, CM 8164 The American Medical Association immediately notified the Food and Drug Administration of these facts, and a nationwide investigation by federal and state regulatory officials was launched. Not all the facts are yet available, but the following information justifies a warning to all physicians and hospitals.

At least 2 and possibly 4 deaths have occurred in Miami, Fla.; Lexington and Louisville, Ky., following administration of Cutter's dextrose and saline bearing code number CM 8164. At least 8 other serious reactions have been reported, mostly from Southern communities. Several 100 liter bottles with this code number are unaccounted for, and the firms' shipping records are so incomplete as to make it impossible to trace and recover all the outstanding material quickly. Although the contaminant has not been identified, it appears to be a heavy growth of bacteria or mold. Many of the unopened bottles show a distinct cloudiness.

Physicians and hospital officials are urged to check their stocks for this code of 5 per cent dextrose in saline and if any is found to hold it and notify the nearest office of the Food and Drug Administration, which is working at top speed to recover all outstanding material.

This unfortunate incident again emphasizes the necessity for prompt notification of the American Medical Association and the Food and Drug Administration of any suspicious or unexpected reaction following the administration of a drug. Quick action by Dr. O'Donnell in notifying the Association of the reactions in his patients has no doubt saved the lives of many other persons. As yet Cutter Laboratories has offered no explanation of why this contamination was not detected before the product was distributed. The medical profession is entitled to know the facts in this case and to be assured that the drugs they purchase are safe.

ORGANIZATION SECTION

Washington Letter

(From a Special Correspondent)

April 30, 1948.

President Truman to Address National Health Assembly

President Truman will address the May 1 banquet of the four day National Health Assembly called to obtain suggestions for the proposed ten year national health program. Federal Security Administrator Oscar R. Ewing said that between six hundred and seven hundred physicians and health specialists were expected to attend. The meeting will be in fourteen sections.

Course on Atomic Radiation Effects

A first class of twenty-seven physicians has completed studies at Walter Reed Medical Center which included instruction on effects on the human body of atomic radiation and bacteriologic warfare. The army described the sixteen week basic science course as "revolutionary." Guest faculty members included more than fifty leading physicians and researchers of the United States and Canada. Diplomas were presented at graduation exercises by Col. Walter H. Moursund Jr., director of the course, following an address by Dr. Alan Chesney, dean of Johns Hopkins University School of Medicine.

Early Diagnosis of Cancer of Breast Advocated at Conference

Dr. Jay McLean of Washington, D.C., advocated clinical examination for cancer of women over 35 years of age every six months, at the three day session of the American Association for Study of Neoplastic Diseases. He declared that cancer mortality could be reduced considerably through improvement in the field of cancer of the breast alone. He emphasized the need for early diagnosis and public cooperation. Dr. George W. Ramsey, Washington, Pa., was elected president; Dr. Ramsey Spillman, New York, vice president; Dr. J. W. Lindsay, Washington, D. C., treasurer, and Dr. E. R. Whitmore, Washington, D. C., secretary. Named to the executive council were Drs. Lewis C. Pusch of York, Pa., Bruce H. Sisler of Memphis, Tenn., and Arthur Petersen of Chicago. Next meeting will be in the autumn in Atlantic City, N. J.

Congress on Tropical Medicine and Malaria

The fourth International Congress on Tropical Medicine and Malaria will be held here May 10 to 18 with scientists from thirty-seven countries presenting some one hundred and eighty papers before twelve convention sessions. Registrations begin May 9 at the Washington Hotel, with the opening session May 10 in the Commerce Department Auditorium and additional sessions in the National Museum Auditorium. There will be three official conference languages: English, Spanish and French. The program will include visits to the National Institute of Health, Naval Medical Research Institute, Army Medical Department and Research and Graduate School of the Agricultural Research Center at Beltsville, Md. A special session May 12 will commemorate the establishment by Walter Reed of mosquito transmission of yellow fever and on May 14, the fiftieth anniversary of mosquito transmission of malaria by Sir Ronald Ross will be observed. Mrs. Truman will receive the wives of the delegates May 13 at a White House tea.

Medical Legislation

STATE LEGISLATION

Mississippi

Bills Enacted.--H. 351 was approved March 13. It enacts a workmen's compensation law. S. 356 was approved March 24. It authorizes an appropriation of $1,500,000 toward construction and equipping of a teaching hospital in the School of Medicine of the University of Mississippi.

New Jersey

Bill Enacted.--A.J.Res. 2 has become joint resolution chapter 3 of the Laws of 1948. It creates a commission to make a survey of all voluntary charitable hospitals throughout the state to determine what steps can be taken to relieve existing overcrowding and to furnish additional revenue for operating costs to relieve the burden now being carried by the voluntary charitable hospitals.

South Carolina

Bills Enacted.—H. 353 has become Governor's Act No. 892 of the Acts of 1948. It provides for the chartering and method of organization and operation of nonprofit medical service plans furnishing medical service by physicians at the expense of the corporation to subscribers to the plan. Medical service includes all general and special medical services ordinarily provided by licensed physicians in accordance with the accepted practices of the community at the time the service is rendered. A physician is defined as any physician duly licensed to practice medicine in the state of South Carolina under the provisions of the medical practice act. S. 1130 has become Governor's Act No. 935 of the Acts of 1948. It amends the hospital licensing law by granting to institutions three years within which to comply with the rules, regulations and minimum standard provided for therein. S. 1559 was adopted April 1, 1948. It is a resolution directing the executive committee of the Board of Health to make a careful investigation of the allocation of funds to the different counties for county health work and to adopt a plan which shall distribute equitably such funds.

Virginia

Bills Enacted.--H.86 has become chapter 399 of the Laws of 1948. It provides regulations for the operation of the hospital construction fund which is utilized in accepting and dispensing funds to be used for the state hospital construction program. S. 76 has become chapter 528 of the Laws of 1948. It provides amendments to and reenactments of the law setting up annual medical scholarships at the Medical College of Virginia and the University of Virginia. S. 77 has become chapter 529 of the laws of 1948. It authorizes and empowers the governing boards of the Medical College of Virginia and of the University of Virginia to establish 35 nurses' scholarships of the annual value of $100 each. S. 106 has become chapter 531 of the Laws of 1948. It amends the medical practice act by authorizing the state board of medical examiners to suspend or revoke the certificate of a physician who has been the legally responsible head of a hospital the license of which has been revoked because of illegal practice or conduct or practices detrimental to the welfare of a patient therein by the state board of health. S. 107 has become chapter 491 of the Laws of 1948. It requires the annual renewal of certificates to practice medicine, homeopathy, osteopathy, chiropractic, naturopathy or chiropody on or before the 30th of June of each year. S. 304 has become chapter 544 of the Laws 1948. It creates within the Department of Health a division of alcohol studies and rehabilitation for the study of the problems of alcoholism, the treatment and rehabilitation of persons addicted to the excessive use of alcoholic beverages and the promotion of preventive and educational programs.

GOVERNMENT SERVICES

ARMY

STUDY OF EMERGENCY MEDICAL CARE

Col. William L. Wilson, M. C., has been engaged in a study of the integration of administration of medical care to the civilian population in the event of war. This study, which has been under way since approved by the Surgeon General in March, 1947, is being conducted in the Department of Public Health Administration of the Johns Hopkins School of Hygiene and Public Health. Colonel Wilson prior to the Normandy invasion was engaged in the planning and supervision of reestablishment of medical care for civilians in all liberated countries and Western Germany. Later he was chief of the public health and welfare branch of the Military Government of the United States zone of Germany.

DR. BEATTIE TO CONDUCT BASIC SCIENCE COURSE

Dr. John Beattie, research director of the Royal College of Surgeons, London, England, conducted on March 15-16 a course on the physiology of injury at the Army Medical Research and Graduate School, Washington, D.C., and also directed discussions at the Army Institute of Pathology. Dr. Beattie will make a four week tour of Army Medical installations throughout the country. During his seven years on the faculty of McGill University, Montreal, Canada, Dr. Beattie worked closely with Dr. Harvey Cushing of Boston on neurophysiologic research on the relation between the hypothalamus and anxiety states. He is perhaps best known for his work on blood transfusion and tissue repair following injury or disease; during the English blitz in the recent war he commanded the Blood Transfusion Service in England.

GENERAL KENNER HEADS SELECTION BOARD

Major Gen. Albert W. Kenner, a member of the personnel board in the office of the Secretary of the Army, has been appointed president of a selection board which will recommend officers of the Regular Army Medical Department for promotion to the permanent grades of lieutenant colonel, major and captain; other members of the board are Brig. Gen. Joseph I. Martin of the Brooke Army Medical Center, Fort Sam Houston, Texas; Brig. Gen. Walter D. Lowe, Surgeon General's Office; Col. John M. Hargreaves, Air Surgeon's Office; Col. Edwin H. Roberts, Fitzsimons General Hospital, Denver; Lieut. Col. Harold C. McKinley and Major Clarence N. Keen of the Adjutant General's Department. The last two officers are recorder and assistant recorder, respectively, and serve without vote. The board convened in Washington, D.C., about April 12.

ARMY AWARDS AND COMMENDATIONS

Captain Leslie Caplan

The Legion of Merit has been awarded to Capt. Leslie Caplan, M. C., A. U. S., now of Minneapolis. The citation read as follows: For exceptionally meritorious conduct in the performance of outstanding services as medical officer for 2,600 American prisoners of war, Luft IV, Gross Tychow, Germany, from Feb. 6, 1945 to April 16, 1945. Captain Caplan with complete disregard for his own personal comfort, health and safety, and in spite of a forced march of more than 600 miles during which the men were deprived of the ordinary necessities of life, so discharged his responsibilities that not a single life was lost. Although suffering from an injured leg, he worked ceaselessly and without complaint, encouraging those who were exhausted and assisting the sick and weak. The extraordinary courage, determination and devotion to duty displayed by him during this period exemplify the highest traditions of the armed forces of the United States. Dr. Caplan graduated from Ohio State University College of Medicine, Columbus, in 1936 and entered military service in July 1941.

NAVY

RESERVE MEDICAL DIVISION

The commandant of the Fourth Naval District announces that Dr. Everett H. Dickinson, Cynwyd, Pa., has been appointed commanding officer of Volunteer Medical Reserve, Medical Division 4-9, U.S. Naval Reserve. Dr. Dickinson served in World War II as a captain of the naval medical reserve corps. The following physicians, all veterans, are members of the staff of this division: Capt. Howard E. Twining, executive officer; Comdr. John G. Hand; Comdr. George D. Geckeler; Comdr. Herbert P. Harkins; Comdr. George Lorenz Jr.; Comdr. David D. Northrop; Comdr. Harry S. Weaver; Lieut. Comdr. Lester L. Bower; Lieut. Comdr. Paul C. Bradford; Lieut. Comdr. Arthur A. Hartley; Lieut. Comdr. John B. Jacobs, Lieut. Comdr. Robert J. McNeill; Lieut. Comdr. Frederick W. Jarvis; Lieut. Comdr. Arthur W. Waddington; Lieut. Comdr. Karl H. Ziegenhorn; Lieut. (jg) Robert P. Gouldin and Lieut. (jg) Irving L. Lichtenstein.

Physicians who are interested may obtain information from the Commandant, Fourth Naval District, U. S. Naval Base, Philadelphia.

PERSONALS

Lieut. Comdr. Justin O. York of Santa Ana, Calif. and Lieut. (jg) Charles R. Stewart of Pittsburgh, both formerly in the naval reserve, have transferred to active duty status.

Capt. John M. Bachulus, at present on the staff of the Commander in Chief of Naval Forces, Eastern Atlantic and Mediterranean, will represent the United States Government at the Health Congress of the Royal Sanitary Institute at Harrogate, England, May 24-28.

Captains Omar J. Brown and Clark G. Grazier have completed a course in internal medicine at Cornell University Medical College, New York, and have been ordered to duty at naval hospitals.

SOCIETY NEWS

Rear Admiral H. Lamont Pugh (MC), assistant chief of the Bureau of Medicine and Surgery, addressed the section on general practice of medicine of the District of Columbia Medical Society, Washington, D. C., on "The Role of the General Practitioner in Modern Medicine."

VETERANS ADMINISTRATION

NEW CHIEF OF PROFESSIONAL SERVICE

Dr. Roy A. Wolford, Washington, D. C., has been appointed assistant medical director for professional service in the Veterans Administration, Department of Medicine and Surgery, and will succeed Dr. Paul B. Magnuson as chief of professional service. Dr. Magnuson was recently appointed medical director of the Veterans Administration. Dr. Wolford is a graduate of the University of Maryland Medical School; he interned at the Maryland General Hospital, Baltimore, and took his residency training at St. Joseph's Hospital, Lancaster, Pa. He served in World War I, following which he entered the U. S. Public Health Service, then in 1924 transferred to the Veterans Bureau. He was on Army duty during World War II with the rank of colonel and assigned to the Veterans Administration. He has served at a number of veterans' hospitals and has been at the central office in Washington, D. C., since 1940 as assistant medical director for tuberculosis and assistant director of the Tuberculosis Division. Dr. Magnuson concluded the announcement by stating that Dr. Wolford had demonstrated his ability as an outstanding physician and inspiring leader and that his appointment is part of the program to accord Veterans Administration physicians, "old and new," the recognition they deserve on the basis of their abilities.

HOSPITAL AT MARLIN, TEXAS

Bids for the construction of a two hundred bed general hospital for veterans at Marlin, Texas, will be opened in Washington May 25. The project includes the main hospital building, manager's quarters, apartment building for the staff, nurses' quarters, attendants' quarters, boiler house, laundry building, incinerator building, 150,000 gallon steel water tank and tower, steel flag pole and radial brick chimney, roads, walks, grading, sewage system, elevators and refrigerating system. The buildings will be of concrete, brick-faced exterior walls with stone trim and backed with hollow tile, reinforced concrete floors and built-up roofs.

STREPTOMYCIN CONFERENCE

The Veterans Administration's Fifth Streptomycin Conference was held at the Hotel Knickerbocker in Chicago April 15-18. The Army, Navy, Public Health Service, National Research Council, National Tuberculosis Association and American Trudeau Society, the pharmaceutic industry, the American Medical Association and hospitals were represented. Among others, the following Veterans Administration consultants took part: Drs. Brian Blades, Ralph Ghormley, Corwin Hinshaw, Esmond Long and Monroe Romansky.

NEW CHIEF OF NEUROPSYCHIATRIC SERVICE

Dr. Paul B. Magnuson, chief medical director of the Veterans Administration, has announced the appointment of Dr. Harvey J. Tompkins of Arlington, Va., as head of the neuropsychiatric service in the department of medicine and surgery to succeed Dr. Daniel Blain, who resigned to become medical director of the American Psychiatric Association. Dr. Tompkins graduated in medicine at Loyola University of Chicago. He joined the Veterans Administration in 1935 and, after serving at hospitals in various states, was assigned to the central office in 1945 as assistant chief of the neuropsychiatry division. He is associate professor in psychiatry at Georgetown University School of Medicine and is certified by the American Board of Psychiatry and Neurology.

PUBLIC HEALTH SERVICE

CREATE CANCER CONTROL COMMITTEE

A committee comprising ten cancer control experts has been created to advise the National Cancer Institute in its campaign to reduce cancer deaths by facilitating prompt detection and treatment. All members of the committee are physicians and public health officials. They will advise the institute on cancer control policy and on requests submitted by State health departments, universities and hospitals for special control project funds. The committee was formed to prevent duplication of efforts and to assure efficient use of federal funds for cancer control. The chairman is Dr. Frank E. Adair, New York. Other members of the committee are: Dr. Herman E. Hilleboe, commissioner, New York State Department of Health; Dr. Charles F. Branch, assistant director, American College of Surgeons, Chicago; Dr. Frank B. Queen, director, Cancer Control Section, Oregon State Health Department; Dr. W. Edward Chamberlain, Philadelphia; Dr. Robert A. Moore, Washington University School of Medicine, St. Louis; Dr. Edmund G. Zimmerer, director of cancer control, Iowa State Department of Health; Dr. Herbert L. Lombard, director, Division of Cancer and Other Chronic Diseases, Massachusetts Department of Public Health; Dr. Charles S. Cameron, medical director, American Cancer Society, New York; Dr. William D. Stovall, state laboratory of hygiene, Madison, Wisconsin. In their first meeting the committee recommended approval of fourteen applications for funds totaling $292,234 for special cancer control projects. These grants ranged from funds for establishing cancer control as part of the public health curriculum in the Harvard and Yale graduate schools to the equipment and operation of a mobile cancer detection trailer for rural Florida and the evaluation of the new cytologic diagnostic technic. All recommendations by the committee have been approved by the National Advisory Cancer Council. The next meeting of the Cancer Control Committee will be held early in June in Washington, D. C.

DR. TOPPING APPOINTED ASSOCIATE DIRECTOR

The U.S. Public Health Service announces the appointment of Dr. Norman Topping to be associate director of the National Institute of Health at Bethesda, Md. This position was recently created to relieve the director, Dr. R.E. Dyer, of many demands resulting from increased activity in medical research. Dr. Topping, a native of Missouri, graduated from the University of Southern California and joined the Public Health Service in 1936. He is a member of the U.S. Typhus Commission and president-elect of the American Society of Tropical Medicine; he has received various awards for research in infectious diseases.

Medical News

(Physicians will confer a favor by sending for this department items of news of general interest: such as relate to society activities, new hospitals, education and public health. Programs should be received at least two weeks before the date of meeting.)

CALIFORNIA

University Promotions.—Stanford University School of Medicine, San Francisco, has announced the following promotions, effective September 1: Dr. Sidney Raffel becomes professor of bacteriology; associate professorships were announced for Drs. Lowell A. Rantz and David A. Rytand in medicine, Dr. Lelland J. Rather in pathology, David C. Regnery, Ph.D., in biological sciences and Dr. Victor Richards in surgery.

Survey of Cancer Facilities.—A survey of cancer facilities in San Diego County, one of a series being conducted in California at the request of local societies, drew attention to the need for (1) a tumor record registry, (2) a fourth tumor board in addition to the three now functioning, (3) extension of public health nursing services to cancer patients in rural areas of the county, (4) educational programs for lay and professional persons and (5) creation of a panel of physicians who will accept referred cancer patients. Data for the survey were gathered through examination of mortality statistics, study of the state hospital survey report, survey of existing institutional facilities, personal interviews and a questionnaire sent to every member of the county medical society.

Personal.—Dr. Konstantin Sparkuhl, Los Angeles, has been decorated by the Chinese Government with the Breast Order of Yun Hui for work as public health consultant as a member of the G-5 Staff of the Formosa Liaison Group, 1945-1946.

CONNECTICUT

Conference of Industrial Physicians.—The Committee on Industrial Health of the Connecticut State Medical Society will sponsor the spring meeting of the New England Conference of Industrial Physicians and Surgeons at the Hotel Bond, Hartford, May 27. Cooperating groups include the Manufacturers Association of Connecticut, Connecticut State Nurses' Association and the Connecticut Safety Society.

COLORADO

Radio Program on Heart Disease.—A program on heart disease produced by radio station KLZ of Denver in cooperation with the Colorado State Medical Society will go on the air as a thirteen week series starting Sunday, May 2, at 10:15 p.m. (Mountain standard time). The format consists of about eleven minutes of documentary dramatization followed by a four minute discussion between the announcer and a participating physician.

ILLINOIS

Residency in Physical Medicine.—A residency training program in physical medicine has been approved by the Council on Medical Education and Hospitals of the American Medical Association, at the 3,500 ward Veterans Administration Hospital at Hines. The Physical Medicine Rehabilitation Service is a large, well organized department, fully equipped for both diagnostic and therapeutic procedures. Residents with veteran status receive $3,300 per year. If interested, write to Dr. K. A. Carroll, Manager, Veterans Administration Hospital, Hines, Ill.

Annual Meeting of State Society.—The Illinois State Medical Society will hold its annual meeting May 10-12 at the Palmer House, Chicago, under the presidency of Dr. Irving H. Neece, Decatur. Out of state speakers include:

Henry W. Woltman, Rochester, Minn., Differential Diagnosis of Poliomyelitis.
Carl H. McCaskey, Indianapolis, Significance of Hoarseness.
Irving S. Wright, New York, Oration in Medicine: Use of Anticoagulants in Treatment of Diseases of the Heart and Blood Vessels.
Karl H. Pfuetze, Cannon Falls, Minn., Present Status of Streptomycin.
Leroy A. Calkins, Kansas City, Kan., Management of Labor.
H. Trendley Dean, D. D. S., Relation of Fluorine to Dental Caries.
Leo G. Rigler, Minneapolis, Early Diagnosis of Cancer of Stomach.
George M. Curtis, Columbus, Ohio, Treatment of Hyperthyroidism.
Robert A. Moore and Edward Mallinckrodt, St. Louis, Tumors of the Testes.
Catherine S. Amatruda, New Haven, Conn., Problems of Growth and Development.
Frank H. Lahey, Boston, Oration in Surgery: Surgical Management of Gastric and Duodenal Lesions.

Various section meetings have been scheduled for the morning of May 11. On Tuesday evening at the annual dinner honoring the president Franklyn Bliss Snyder, Ph.D., president of Northwestern University, will be the principal speaker. The Woman's Auxiliary will meet at the Congress Hotel May 10-11. A number of special societies and alumni groups will meet in conjunction with the state society. Technical and scientific exhibits will be on display.

Chicago

Fourth Cancer Center Opens.—A cancer detection clinic was opened March 30 at Mercy Hospital to serve women. A second unit at the hospital will open April 8 for men. The city's four centers will be serving 700 persons a month. There is a waiting list of several thousand.

Personals.—Dr. J. Garrott Allen, University of Chicago School of Medicine, has been awarded the John J. Abel prize for his research on control of bleeding due to irradiation. The award was conferred by the American Society for Pharmacology and Experimental Therapeutics. Charles T. Craddock, for eleven years director of sales of the Edgewater Beach Hotel, has been appointed general superintendent of the Municipal Tuberculosis Sanitarium to succeed Dr. Leo M. Czaja, who resigned recently.

Pusey Memorial Lecture.—J. Christian Bay, Litt. D., librarian emeritus of the John Crerar Library, will delivery the second William Allen Pusey Memorial Lecture of the Institute of Medicine of Chicago on Friday evening, May 28, at the Palmer House on "The Search for the Vital Principle."

Society News.—The North Shore Branch of the Chicago Medical Society will meet at the Edgewater Beach Hotel May 4 for a fellowship gathering at 6:30 p.m. and a scientific meeting at 8:00 p.m. Dr. Arthur C. Curtis, head of the department of dermatology, University of Michigan Medical School, Ann Arbor, will be the guest speaker on "Modern Treatment of Syphilis."

MASSACHUSETTS

Boston Alumni Meeting.—The Alumni Association of Boston University Medical School will hold its annual meeting May 7 in the Medical School Auditorium. An informal luncheon will be held at 12:30 p.m. on the medical school campus, and a reunion and dinner at 5:30 p.m. at the Hotel Statler.

Tufts Medical Alumni Lecture.—The annual Medical Alumni Lecture will be given at Tufts College Medical School, Boston, May 5 at 4 p.m. Dr. Daniel L. Lynch, Boston, of the class of 1907, will speak on problems in industrial medicine. All physicians and students are invited to attend.

MICHIGAN

Dr. Cummings Heads State Department of Health.—Dr. George D. Cummings of the State Bureau of Laboratories, Lansing, became acting commissioner of the Michigan Department of Health March 17, succeeding Dr. John K. Altland, who resigned and returned to his former position as director of the department's Bureau of Local Health Services. Dr. Cummings has been a member of the state health department for twenty-two years, having been promoted in the Bureau of Laboratories from junior bacteriologist in 1926 to director of the bureau in June 1944. He is a graduate of Wayne University College of Medicine, Detroit, 1943, and received a doctor of philosophy degree from the University of Michigan, Ann Arbor, 1934.

NORTH CAROLINA

Appoint State Health Officer.—Dr. John W.R. Norton, Chattagooga, Tenn., was elected North Carolina State Health Officer at a meeting of the State Board of Health, called to select a successor to Dr. Carl V. Reynolds, Raleigh, who will retire June 30. Dr. Norton is graduate of Vanderbilt University School of Medicine, Nashville, Tenn., 1928. He was superintendent of health at Rocky Mount from 1931 to 1935. In 1936 he joined the state board of health as assistant director of county health work and later as assistant director of preventive medicine. He served the University of North Carolina as professor of public health administration from September 1938 to November 1940, when he entered the U.S. Army. Since that time he has been with the Tennessee Valley Authority at Chattanooga, Tenn.

NEW YORK

Annual State Medical Meeting.—The annual meeting of the Medical Society of the State of New York will be held May 17-21 at the Hotel Pennsylvania, New York. Scientific sessions will be held on Wednesday and Friday afternoons, at which the following will be guest speakers:

Thomas Francis Jr., Ann Arbor, Mich., Distribution of Poliomyelitis Virus in the Community.
Arthur L. Watkins, Boston, Contributions of Physical Medicine in Poliomyelitis.

The A. Walter Suiter Lecture will be delivered Friday by Dr. Alfred Steiner, New York, on significance of cholesterol in coronary arteriosclerosis. There will be numerous section meetings. Tuesday will be Teaching Day, for which the Council Committee on Public Health and Education of the society will present a series of lectures. The annual banquet will be on the Penn Top Wednesday. The annual convention of the Woman's Auxiliary will be May 16-19 at the Hotel Pennsylvania.

New York City

Postgraduate Instruction.—The Rockland County Medical Society will hear the following lecture at the Summit Park Sanatorium, Pamona, at 4:30 p.m. May 5: John C. M. Brust, Syracuse, "Cancer of the Rectum and Colon - Present Day Concepts."

Miller Memorial Lecture.—Rene J. Dubos, Ph.D., member of the Rockefeller Institute for Medical Research, will deliver the Adam M. Miller Memorial Lecture on "The Tubercle Bacillus and Tuberculosis" May 4, 4 p.m., at the Polhemus Memorial Building, Long Island College of Medicine.

Alumni Day.—The Long Island College of Medicine will observe Alumni Day May 8 at the Knights of Columbus Club, Brooklyn. The speakers will be: Drs. A. W. Martin Marino, president of the Alumni Association, and James A. Curran, president of the College of Medicine. Dinner reservations should be made before May 3 to the Alumni Association, Long Island College of Medicine, 350 Henry Street, Brooklyn 2.

OKLAHOMA

Annual State Meeting.—The Oklahoma State Medical Association will hold its annual meeting May 17-19 at the Skirvin Hotel, Oklahoma City, under the presidency of Dr. Paul B. Champlin, Enid. All section meetings will begin at 9 a.m. and general sessions at 2 p.m. Guest speakers at the general sessions include:

Helen B. Taussig, Baltimore, Malformations Amenaable to Surgery: Diagnosis and Indications for Operations.
Arild E. Hansen, Galveston, Texas, Rheumatic Fever as a Diagnostic Problem.
Jack R. Ewalt, Galveston, Texas. General Practitioner's Responsibility in Psychiatry.
Andrew W. McAlester III, Kansas City, Mo. Management of Eye Diseases.
Laman A. Gray, Louisville, Ky., Hormone Therapy.
Richard B. Cattell, Boston, Surgical Management of Carcinoma of Rectum.
Franklin H. Top, Detroit, Epidemiology and Treatment of Poliomyelitis.
Vincent Vermooten, Dallas, Texas. Injuries of Urethra, Their Diagnosis and Care.
Leo H. Garland, San Francisco, Present Status of Radiation Therapy in Cancer.

A sumposium on "What's New in Medicine" will be held Tuesday at 8 p.m. with guest speakers participating. Both technical and scientific exhibits and round table luncheons have been arranged. The president's inaugural dinner dance will be at 7 p.m. Wednesday, with Dr. Alan Moritz, Boston, speaking on "Medicine's Contribution to Crime Detection." The Women's Auxiliary will meet May 16 at the Skirvin Hotel.

SOUTH CAROLINA

State Society Centennial Meeting.—The South Carolina Medical Association will hold its centennial meeting in Charleston May 12-14. A history of the association, prepared by Dr. Joseph I. Waring, Charleston, and bound in book form, will be distributed to members. Special speakers who will appear on the program are: Dr. James E. Paullin, Atlanta, Ga., representing the American Medical Association; Dr. Warren W. Quillian, Coral Gables, Fla., representing the Florida Medical Association; Dr. Isaac A. Bigger, Richmond, Va., representing the Medical Society of Virginia; and Dr. Verling K. Hart, Charlotte, N. C., representing the Medical Society of the State of North Carolina. Dr. Reginald Fitz, Boston, will speak at the banquet. Dr. Olin B. Chamberlain, Charleston, is the president and Dr. Robert B. Durham, Columbia, the president-elect.

GENERAL

Bacteriologists' Meeting.—The Society of American Bacteriologists will be guests of the Minnesota Bacteriologists at their general meeting at the Nicollet Hotel in Minneapolis May 11-14. Papers will be presented in the various fields of bacteriology. The president's reception and the annual banquet will be held Wednesday evening.

Anniversary of the Discovery of Radium.—At an American Cancer Society dinner in Philadelphia March 31, commemorating the fiftieth anniversary of the discovery of radium by Pierre and Marie Curie, their daughter Mlle. Eve Curie, French author and journalist, received a $10,000 grant for the work of Dr. Antoine Lacassagne of the Radium Institute in Paris. Mlle. Curie said that the money would be used to buy an infrared spectrograph for the institute.

Memorial to Pharmacists.--At ceremonies in the offices of the American Pharmaceutical Association, Washington, D. C., May 7, a memorial to all pharmacists who served in the wars of the nation will be presented by the donor, Henry A. B. Dunning, Sc.D., past president of the American Pharmaceutical Association. Honorable Kenneth C. Royall, Secretary of the Army, will give the principal address. Dr. Robert L. Swain, chairman of the Committee on Dedication, will preside.

Ophthalmological Society Meeting.--The American Ophthalmological Society will hold its annual meeting at the Homestead, Hot Springs, Va., May 17-19 under the presidency of Dr. Henry C. Haden, Houston, Texas. Among the subjects of numerous papers to be presented are corneal transplantation in keratoconus, myopia cures, surgical procedures in the treatment of retinal vascular disease, epidemiologic observations on epidemic keratoconjunctivitis and ocular lymphomas.

Federation for Clinical Research.—The national meeting of the American Federation for Clinical Research will be held in Chalfonte-Haddon Hall, Atlantic City, N.J., May 3-4. The program will begin at 8 p.m. with the first public showing of the colored film "Kidney Function in Health." Among the subjects of papers to be presented are: primary atypical pneumonia; reasons for failure of "dicumarol" in treatment of coronary thrombosis; hyaluronidase, and electrolyte metabolism in gastric cancer and Addison's disease.

Meeting of Genito-Urinary Surgeons.—The American Association of Genito-Urinary Surgeons will hold its annual meeting May 12-14 at the Skytop Lodge, Skytop, Pa., under the presidency of Dr. Cyrus E. Budford, St. Louis. Among the subjects to be discussed are lymphosarcoma of the kidney; vesicointestinal fistulas; radical perineal prostatectomy for cancer of the prostate; an analysis of 221 cases; effect of neutron rays on the testicle; role of sex hormones in sexual differentiation and in sex abnormalities, and pregnancy in the presence of reduced renal tissue.

Annual Meeting of Psychiatrists.—The American Psychiatric Association will have its one hundred and fourth annual meeting May 17-20 at the Statler Hotel, Washington, D.C., under the presidency of Dr. Winfred Overholser, Washington, D.C. Among the subjects to be discussed are: atomic energy in medicine, psychiatry among the Chinese, brain surgery and glutamic acid in increasing intelligence. Subjects of round table dinner meetings on Tuesday evening include neuropsychiatric service in general hospitals and aggression of childhood. There will be a symposium on emotional factors in chronic headaches Wednesday afternoon.

Association of American Physicians.—The annual meeting of the Association of American Physicians will be held at the Chalfonte-Haddon Hall, Atlantic City, N.J., May 4-5 under the presidency of Dr. Alvah H. Gordon, Montreal, Canada. Subjects to be discussed include: hormonal and vitamin factors in intestinal absorption; diuresis in patients with nephrosis; treatment of bacterial endocarditis; auscultation of the heart, a neglected subject; management of ulcerative colitis; the changing aspect of poliomyelitis; systematic manifestations of rheumatoid arthritis. The George M. Kober Medal will be presented to Dr. Warfield T. Longcope, Baltimore. The dinner address Tuesday at 7:30 p.m. will be given by Dr. O. H. Perry Pepper, Philadelphia.

American Urological Association.--The annual meeting of the American Urological Association will be held at the Hotel Statler, Boston, May 17-20, under the presidency of Dr. Herbert H. Howard, Boston. Among the subjects under discussion are: urinary tract calculi in recumbent patients, late renal changes in paraplegic persons, treatment of ureteral colic, thoracolumbar sympathetic block, and the urologist and artificial insemination. Dr. Arthur Jacobs, Glasgow, Scotland, and Dr. J. G. Yates Bell, London, England, will be guest speakers on Tuesday's program. There will be a symposium on genitourinary tuberculosis on Tuesday; and on Wednesday the prize essay, "Formation of an Artificial Bladder with Perfect Continence: An Experimental Study," will be presented by the writer, Dr. Seymour W. Rubin, Baltimore. The Ramon Guiteras Lecture, "Clinical Endocrinology and the Cancer Problem," will be given by Dr. Cornelius P. Rhoads, New York. Presentation of the third annual award for research in human male reproductive tract will be presented to Dr. Charles B. Huggins, Chicago, who will address the society on "Recent Studies of Reproductive Tract Physiology." A motion picture program and scientific and technical exhibits have been arranged.

HAWAII

Annual Meeting of Hawaii Medical Association.--The Hawaii Territorial Medical Association will hold its annual meeting May 6-9 in Honolulu under the presidency of Dr. Robert B. Faus of that city. Guest speakers include:

Samuel C. Harvey, New Haven, Conn., Recent Advances in Surgery.
Paul Klemperer, New York, Pathologic Anatomy and Biology.
Mr. Theodore R. Sills, Public Relations Counsel of the American Medical Association, Chicago, The Public Looks at the Doctor.
W. Lloyd Aycock, Boston, Epidemiologic Significance of the Behavior of Poliomyelitis.

The first exhibit of the Hawaii Physicians' Art Association will be held in the Honolulu County Medical Library during the meeting. Scientific exhibits relating to cancer and leprosy will be displayed in the headquarters building.

Breakfast round table discussions will be held at the Pacific Club Saturday, one on surgery led by Dr. Harvey and the other on pathology led by Dr. Klemperer.

Marriages

EDWARD LEROY PROCTOR, Conway, S. C., to Miss Mary Roberta Woodard at Charleston, February 28.

LAY MARTIN FOX, Baltimore, to Miss Jean Selby of Mendota, Ill., Dec. 30, 1947.

WILLIAM DONALD BAKER, Cleveland, to Miss Mary Lou Belcher of Youngstown, recently.

Deaths

William Lester Smith ⊕ Senior Surgeon, U. S. Public Health Service, retired, Carbondale, Ill.; born in Toledo, Ill., Jan. 1, 1883; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1906; entered the Public Health Service in 1919 and retired in 1946; stationed at Marine hospitals in Norfolk, Va., Staten Island, N. Y., New Orleans and Louisville; fellow of the American College of of Physicians; during World War I served overseas with the British Army and as a captain in the medical corps of the U. S. Army, receiving the Purple Heart and the British Military Cross; in 1943 the Boy Scouts of America awarded him the Silver Buffalo for 'distinguished service to boyhood'; chief medical officer of the Scout National Jamboree held at Washington, D. C., in 1937; died in the U. S. Marine Hospital in Kirkwood, Mo., February 15, aged 65, of pneumonia.

Harry Eaton Stewart ⊕ New Haven, Conn.; born in St. Louis in 1887; Yale University School of Medicine, New Haven, 1910; attached to the Surgeon General's Office, U. S. Army, during World War I as assistant director of physiotherapy and director of physiotherapy in the United States Public Health Service and Veterans Bureau; for many years consultant in physiotherapy at the Veterans Administration; major, medical reserve corps, U. S. Army, not on active duty; past president of the Connecticut State Physical Therapy Society; consultant in physical medicine at the Norwalk General Hospital in Norwalk, Conn.; died January 6, aged 60, of coronary occlusion.

Dudley Anderson Robnett ⊕ Columbia, Mo.; born in Columbia, Mo., May 28, 1895; Johns Hopkins University School of Medicine, Baltimore, 1919; associate professor of pathology at the University of Missouri School of Medicine; member of the founders group of the American Board of Surgery; member of the Western Surgical Association; fellow of the American College of Surgeons; chairman of the Missouri division of the American Cancer Society; on the staffs of the State Hospital in Fulton, Boone County General Hospital and Ellis Fischel State Cancer Hospital; died suddenly January 25, aged 52.

Charles Moore Franklin ⊕ Union Springs, Ala.; Columbia University College of Physicians and Surgeons, New York, 1898; an examining physician for the local draft board during World War I; served as a member of the city board of education and as county and city health officer; past president of the Bullock County Medical Association; surgeon of the Central Georgia Railroad and of the Alabama Power Company; died in Montgomery February 2, aged 74, of acute myocarditis.

Edward Andruss, Holden, Mo.; Kansas City (Mo.) Homeopathic Medical College, 1897; member of the American Medical Association; died January 14, aged 84, of coronary occlusion.

Abraham Henry Bowers, Jamestown, N. Y.; University of Wooster Medical Department, Cleveland, 1886; served as county coroner, city physician and city health officer; died Dec. 28, 1947, aged 94, of chronic myocarditis.

John Calvin Brink, Gary, Ind.; Indiana University School of Medicine, Indianapolis, 1942; interned at the Methodist Hospital in Indianapolis; served a residency in surgery at the City of Detroit Receiving Hospital in Detroit; died in the Methodist Hospital January 5, aged 35.

James Samuel Christian, Alberta City, Ala.; Birmingham Medical College, 1912; member of the American Medical Association; died in the Druid Hospital, Tuscaloosa, January 18, aged 64.

Frank Hubert Crawford, Mount Sidney, Va.; College of Physicians and Surgeons, Baltimore, 1896; member of the American Medical Association; died January 14, aged 74, of cerebral hemorrhage.

William John Dailey, Oakland, Calif.; Minneapolis College of Physicians and Surgeons, 1911; veteran of the Spanish-American War; died January 9, aged 63, of cerebral hemorrhage.

Margaret Lincoln Dale, Kansas City, Kan.; University of Kansas School of Medicine, Kansas City, 1933; interned at the New York Infirmary for Women and Children in New York; died in the Swedish Hospital in Seattle January 31, aged 45, of cardiovascular disease.

Leonidas DeLaine, Greenville, Miss.; Meharry Medical College, Nashville, Tenn., 1916; served during World War I; died January 11, aged 57, of heart disease.

Faust Stansfield Delong, Richfield Springs, N.Y.; Columbia University College of Physicians and Surgeons, New York, 1901; member of the American Medical Association; died in DeLand, Fla., January 15, aged 70.

John Casimer Dubiel, Chicago; Loyola University School of Medicine, Chicago, 1932; member of the American Medical Association; died in St. Luke's Hospital February 3, aged 41.

George Reese Du Vall, Western, Neb.; University Medical College of Kansas City, Mo., 1904; member of the American Medical Association; died in Fairbury Dec. 21, 1947, aged 65.

Harry H. F. Fredrick, Westfield, Wis.; Detroit College of Medicine, 1894; also a graduate in pharmacy; died January 16, aged 84.

Maurice Arthur Gilbert ⊕ Chelsea, Mass.; Tufts College Medical School, Boston, 1914; served during World War I; affiliated with the Whidden Memorial Hospital in Everett and the Chelsea Memorial Hospital; died January 18, aged 60, of carcinoma.

Ray Carr Green, San Bernardino Calif.; Northwestern University Medical School, Chicago, 1928; member of the American Medical Association; served during World War II; at one time assistant surgeon in the U. S. Public Health Service; died Jan. 16, 1947, aged 47, of coronary thrombosis.

Alfred Wilbur Hadley, Indianapolis, Indiana University School of Medicine, Indianapolis, 1910; member of the American Medical Association; served during World War I; for many years chief surgeon at the Indiana State Soldiers' Home Hospital in Lafayette; died in the Veterans Administration Hospital January 16, aged 74, of cerebral hemorrhage.

Frederick Henry Harnagel, Chicago; St. Louis University School of Medicine, 1912; found dead in a hotel at Pontiac, Ill., February 10, aged 61, of coronary thrombosis.

William Hoddick, Buffalo; University of Buffalo School of Medicine, 1886; died in the Edward J. Meyer Memorial Hospital January 20, aged 85, of carcinoma of the colon.

Thomas Howell, New York; Dartmouth Medical School, Hanover, N.H., 1896; served as superintendent of the Overlook Hospital in Summit, N.J., and the Worcester City (Mass.) Hospital; head of the outpatient department and formerly superintendent of the New York Hospital Cornell Medical Center, where he died January 24, aged 79, of carcinoma of the prostate.

Roy Sterling Hubbs, Butler, Ohio; Pulte Medical College, Homeopathic, Cincinnati, 1896; died January 16, aged 73.

Burton Leroy Jacobs, Chattanooga, Tenn.; George Washington University School of Medicine, Washington, D.C. 1916; fellow of the American College of Surgeons; member of the American Medical Association; past president of the Chattanooga-Hamilton Counties Medical Society; served during World War I; affiliated with the Pine Breeze Sanatorium and the Baroness Erlanger Hospital; died January 14, aged 64, of coronary thrombosis.

John Walter Jeans, Prosperity, Mo.; University Medical College of Kansas City, 1895; died January 25, aged 83.

Walter Robert Johnson, Richmond Hill, N.Y.; Cornell University Medical College, New York, 1945; interned at the Long Island College Hospital in Brooklyn; served during World War II; died in San Francisco January 2, aged 26, of injuries received in an automobile accident.

John Joseph Kane ⊕ Prairie Du Chien, Wis.; Loyola University School of Medicine, Chicago, 1921; affiliated with the Beaumont Hospital and the Prairie Du Chien Sanitarium; died recently, aged 53, of coronary occlusion.

George Logan Kennedy ⊕ Ninety Six, S. C.; Medical College of the State of South Carolina, Charleston, 1921; member of the board of trustees of the high school; died January 12, aged 53, of congestive heart disease.

William Lee Kirkpatrick, Waynesville, N. C.; University of Nashville (Tenn.) Medical Department, 1894; Vanderbilt University School of Medicine, Nashville, 1894; member of the American Medical Association; an honorary member of the staff of Haywood County Hospital, where he died January 11, aged 77, of injuries received in an automobile accident.

Henry Knox ⊕ Philadelphia; Jefferson Medical College of Philadelphia, 1890; died January 4, aged 75, of bronchopneumonia.

John Elliot Langstaff, Morristown, N. J.: University of Toronto Faculty of Medicine, Toronto, Canada, 1878; at one time practiced in Brooklyn, where he served on the staff of St. John's Hospital; died in Bernardsville January 15, aged 91, of arteriosclerosis and benign hypertrophy of the prostate.

William Marshall Love ⊕ Monroe, N.C.; North Carolina Medical College, Charlotte, 1915; past president of the Union County Medical Society; died January 22, aged 62.

William McKeage, Philadelphia; University of Pennsylvania Department of Medicine, Philadelphia, 1892; member of the American Medical Association; died in the Masonic Home January 5, aged 78.

Archibald McMillan, Athol, Mass.; Medical School of Maine, Portland, 1904; member of the American Medical Association; served with the Canadian Army during World War 8; died January 16, aged 75.

Harry Hilts Maynard ⊕ New Haven, Conn.; Yale University School of Medicine, New Haven, 1916; a brigadier general in the medical corps, Army of the United States, during World War II serving as commanding officer of the 12th Medical and General Dispensary in London; affiliated with Grace Hospital; died in the Hospital of St. Raphael January 8, aged 60, of bronchopneumonia.

Nina Polson Merritt, Alton, Ill.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1901; member of the American Medical Association; died January 8, aged 75.

Schuyler Nichols, Herington, Kan.; Barnes Medical College; St. Louis, 1901; member of the American Medical Association; killed January 25, aged 72, in an automobile accident.

Richard J. O'Brien, Wauwatosa, Wis.; Chicago Medical School, 1922; formerly associated with the Indian Service; died January 3, aged 57.

Leon Morton Ochs, St. Louis; State University of Iowa College of Medicine, Iowa City, 1910; served as chief of the medical service at the Veterans Administration Facility at Jefferson Barracks; died January 8, aged 61.

Noah Samuel Peters, Bristol, Tenn.; Hospital College of Medicine, Louisville, 1900; died recently, aged 74.

Charles Henry Phillips ⊕ Beverly, Mass.; Medical School of Maine, Portland, 1900; formerly chairman of the board of health; affiliated with the Beverly Hospital; died December 22, 1947, aged 76, of Hodgkin's disease.

Ernest Dean Pillsbury, Stoughton, Mass.; Tufts College Medical School, Boston, 1896; member of the American Medical Association; an officer during World War I; served in the U. S. Public Health Service reserve and on the staffs of various Veterans Administration hospitals; died January 6, aged 79, of pneumonia.

Hallie Tecumseh Pitts, Henderson, Tenn.; University of Tennessee Medical Department, Nashville, 1905; member of the American Medical Association; health officer for many years; died December 27, 1947, aged 65, of diabetes mellitus and heart disease.

Charles Henry Poole, Ruffs Dale, Pa.; Jefferson Medical College of Philadelphia, 1907; served during World War I; affiliated with the Henry Clay Frick Memorial Hospital in Mount Pleasant; died January 7, aged 63, of coronary occlusion.

John P. Ramsay ⊕ Vincennes, Ind.; Medical College of Ohio, Cincinnati, 1889; died in January, aged 85.

Charles Thomas Riggs, Upton, Ky.; Kentucky School of Medicine, Louisville, 1904; died January 29 aged 71.

Benjamin Bissell Robins ⊕ Bristol, Conn.; University of the City of New York Medical Department, New York, 1894; past president of the Hartford County Medical Association; for many years health officer and police surgeon; died January 9, aged 77, of heart disease.

Edgar Smith ⊕ Lockhart, Texas; University of Louisville (Ky.) Medical Department, 1897; served on the selective service boards during World Wars I and II; died Dec. 30, 1947, aged 75, of coronary occlusion.

Edgar L. Vermilya, Fremont, Ohio; Toledo Medical College, 1897; member of the American Medical Association; for many years city health commissioner; affiliated with the Memorial Hospital; died Dec. 19, 1947, aged 73, of lymphatic leukemia.

Harry Hall Winters ⊕ Tuskegee, Ala.; Tulane University of Louisiana School of Medicine, New Orleans, 1924; died January 29, aged 50, of coronary thrombosis.

Benjamin Collins Woodbury, Boston; Boston University School of Medicine, 1906; trustee and member of the staff of the Hahnemann Hospital; died January 22, aged 65, of cerebral thrombosis.

Ozro Wright, Seiling, Okla.; Kansas City Medical College, 1904; died in Clinton recently, aged 83, of pneumonia.

The National Health Service

Of the various objections to the proposals of the National Health Service, the one that has become predominant in the medical press is that the medical profession loses its freedom in consequence of the power assumed by the Minister of Health. Though administration is to be in the hands of various committees, the final decision on everything rests with the minister. As the whole practice of medicine, domicilary and hospital, general and specialist, for both rich and poor, is socialized, its control passes to the state and is exercised by the Minister of Health. Curiously those negotiating for the profession do not seem to have appreciated this danger when they accepted medical socialism.

In the press and in Parliament a heated controversy proceeds. It is unfortunate that the practice of medicine should be dragged into the mire of party politics and become the subject of the usual exaggerations and fictions. The government and its press represent the proposed service as a wonderful achievement, a model for the whole world, overlooking entirely the serious drawbacks of bureaucratic control of such a personal thing as medical practice, as has been found in the case of New Zealand. It is said that it is a "reactionary profession" or "the old gentlemen of the British Medical Association" who are obstructing a most benificent reform. In a broadcast a former cabinet minister said that the young physicians who had been demobilized from the army and settled in the new housing districts were joining the service. He may have been told of some doctors of the kind, but the impression he gave, that there was a general movement such as he described, was unfounded. So also is the attempt to represent the opposition as a matter of senility. The plebicite taken by the British Medical Association carefully distinguished the different sections of the profession and showed an overwhelming majority of assistants, mostly young men, opposed to the proposals of the government. Another fiction propounded by the government is that the opposition of the profession is due to political dislike of the labor party. As a matter of fact, opposition has always been on professional grounds and never associated with any political party. In the correspondence columns of the *British Medical Journal* those who are avowed socialists in general politics have registered their disapproval of the act.

A representative meeting of the British Medical Association, which was attended by four hundred members, has decided unanimously not to enter the national health service unless substantial changes are made in the act of Parliament. A resolution from the council of the association embodying this decision reaffirmed the desire of the medical profession for a comprehensive health service but urged that in the public interest changes in the act were necessary to prevent physicians being turned into state servants with harmful consequences to patient and doctor alike. The resolution expressed the hope that the government would make it possible for the members of the profession to cooperate by making such changes, as it was not in the best interests of the public or of medicine for members of the profession to enter the service until such changes were made. In making the resolution the chairman, Dr. H. Guy Dain, said that the powers possessed by the Minister of Health would lead to the enslavement of the medical practitioners, who were engaged in a life and death struggle for their freedom and independence. But physicians were willing to listen to constructive proposals for the working of the service should the minister make them. In the discussion Lord Horder referred to the mendacious statements in the House of Commons and sections of the press, which caused doubt in the public mind whether the British Medical Association was a constitutionally democratic body and represented the medical profession. "If the public considered the situation it would realize the unscrupulousness of a minister who, having as a result of two short sessions failed to get what he wanted, should say that the representatives of the association were a small body who had consistently misled the great profession to which they were supposed to belong. And he accused the association of being involved in a squalid political conspiracy."

Dr. J. A. Brown, Birmingham, raised the question of "what looked like organized political and trade union pressure on doctors to join the service." He read letters written to physicians from labor organizations asking them whether they were prepared to join the service. This was a scandalous attempt at intimidation. A resolution was carried condemning as grossly improper political pressure on individual doctors to inform outside bodies of their intentions in relation to the new service.

Rupture Of Cervical Intervertebral Disks

The production of neurologic symptoms by rupture of intervertebral disks is a comparatively recent discovery, and cases in which the cervical region is involved are the last to receive attention. At the neurologic section of the Royal Society of Medicine Dr. W. Russell Brain opened a discussion on this subject. The symptoms may be those of cervical root irritation or cervical cord compression, or both. The pathologic basis may be a simple osteoarthritis of the spine or a true lesion of the disk; often it is a combination of both. Of 10 surgically verified cases, most were in persons of middle age or over. Only 2 had root symptoms alone, the majority having compression of the cord.

There were four modes of onset of symptoms: acute pain in the neck and one arm; insidious or remitting aching in the same areas; gradual development of root and cord compression, or, most uncommon, a quietly progressive cord lesion alone. The main symptom of root compression was shooting or burning pain, increased by coughing and moving the neck and with periods of remission; this might radiate widely into the chest or scapular region. Any associated sensory loss was often slight and superficial. Diminution of tendon reflexes was common, but wasting was unusual. Of 8 cases with cord features, 4 exhibited a Brown-Sequard syndrome and 4 showed evidence of bilateral compression, but in every case except one the protrusion of the disk was lateral. The syndrome might be bilateral and symmetric from the onset with no clue to the side of the lesion. The pyramidal tracts were more vulnerable than the sensory fibers, though it was the anterolateral tracts that were directly exposed to pressure. Associated wasting of the intrinsic muscles of the hand, the innervation of which was two or three segments lower than the usual level of the lesion, was common. This must be due to descending edema

Council on Medical Education and Hospitals

ANNUAL CONGRESS ON MEDICAL EDUCATION AND LICENSURE

Forty-Fourth Annual Meeting Held in Chicago,
Feb. 8, 9 and 10, 1948

Monday Morning, 9:30

DR. HERMAN G. WEISKOTTEN, Syracuse, N.Y., Presiding

The Financial Support of Medical Education

DR. HERMAN G. WEISKOTTEN, Dean, Syracuse University College of Medicine: The Council on Medical Education and Hospitals of the American Medical Association conjointly with the Association of American Medical Colleges and the individual colleges has assumed active leadership in the development and maintenance of high standards.

Advances in medical education have been in the direction of integration of its programs with medical care programs. Medical students devote much of the final two years of undergraduate training to actual study and care of patients in hospitals and outpatient departments. This places clinical departments on an academic basis and adds enormously to the cost of medical education.

Realizing the importance of resident staffs and internships to medical education, the Council on Medical Education and Hospitals undertook over thirty years ago to survey hospitals engaged in the training of interns and to publish lists of hospitals approved for internships. The Council appointed committees to study and recommend the type and amount of preparation essential for securing expertness in each of the special fields of medicine. A program of inspection and listing of hospitals specifically approved for residencies in the various specialties was initiated by the Council, thus making its influence felt in the field of graduate as well as undergraduate medical education.

In 1933 the Council started approving specialty boards in conformance with formulated standards of administration. The Advisory Board of Medical Specialties, consisting of representatives from each of the recognized boards, was organized a year later. The Advisory Board works in close cooperation with the Council, which in turn works in close cooperation with the individual specialty boards.

Ten years ago the annual budgets of the medical schools of the United States totaled $23,000,000. These same schools have current budgets of more than $40,000,000. Today no school has a budget under $200,000, which is more than the individual budgets of twenty-six schools ten years ago. Increases in the budgets of medical schools are attributed to improved teaching methods, especially in the clinical subjects, and the placing of much of the clinical faculty on an academic basis. Although progress has been made toward practically doubling the financial support of medical schools during the past ten years, the increased support falls far short of satisfactory basic support in many of the schools. In most instances increased support has come from private funds, which are becoming less readily available, probably due to the enactment of tax legislation by federal and state governments. Future needs for financial support for medical education, medical research and medical care will exceed those of the present.

ALAN VALENTINE, Ll.D., President, University of Rochester, read a paper entitled "The Privately Endowed Medical Schools: Their Present and Future Planning." This paper appears in full in this issue of THE JOURNAL.

HOMER W. SMITH, Sc.D., Professor of Physiology, New York University College of Medicine, read a paper on "The Present status of Proposed National Science Legislation," which appears in full in this issue of THE JOURNAL.

Financial Relationships of Medical Schools and Teaching Hospitals

DR. N. W. FAXON, Director, Massachusetts General Hospital, Boston: Medical schools and hospitals can be described as symbiotic. Historically, medical schools began in ancient temples which represent hospitals. Later medical schools became separated as integral parts of universities and finally they have rejoined, thus producing the teaching hospital. Hospitals are primarily for the care of patients but they must additionally advance knowledge, train physicians, participate in research and strive to set standards and examples of practice. Both the hospital and medical school play indispensable roles in the education of physicians. In the school the physician must acquire a basic scientific body of information essential to medicine. In the hospital he contacts the patient and under guidance of clinical instructors first deals with human beings as patients. He learns to listen, question, examine and appraise. Later as an intern he acquires special technics, particularly in the branch of medical practice he is to pursue. Therefore, of a total of six to seven years, at least four years are spent in hospital training. In 1850 one year of study produced a so-called doctor. It now takes up to thirteen years. Professional competence is now acquired by slow acquisition of responsibility, which entails dealing with patients before the doctor is fully trained. As such transition is slow, it is costly and society, i.e., the public, must recognize its responsibility to medical education by cooperating and aiding the student in making this transition.

As the medical school and hospital are inextricably bound together for two common objectives, i.e., training of doctors and advancement of knowledge, and both objectives require money, we must decide who should provide the necessary funds. There are three basic types of medical school faculty and hospital staff organization, typified by the following institutions: (1) The University of Chicago Clinic is part of the School of Medicine of the university. The faculty and staff are identical. All patients are patients of the full time staff. All doctors are on straight salary. Fees obtained go to the university. Salaries are not dependent on the amount of clinical practice but come from the university. (2) University of Rochester. Strong Memorial Hospital is part of the School of Medicine and Dentistry and shares in the endowment of the school. Members of the Staff of hospital and faculty are identical. They may be full time salaried or part time unsalaried members. Full time salaried members may increase their income from private professional fees. Part time members of the staff are privileged to have private patients on private floors. All on the staff participate in the care of patients, teaching and research. All salaries come from the university. (3) Harvard. All teaching hospitals used by Harvard Medical School are separate corporations. All have some staff members who hold faculty appointments. Appointments to the staff at Massachusetts General Hospital are made by trustees of the hospital. Appointments to the faculty are made by the president and fellows of the university. Not all staff appointees hold medical school appointments. Part of the hospital staff is on a full time salaried basis; the major portion of the part time staff is unsalaried. Both full time and part time members of the hospital staff have private patients and retain professional fees. All are supposed to participate in the care of patients, teaching and research. Salaries may be all from the university, all from the hospital or part from the university and part from the hospital.

When both school and hospital are university units the source of the salaries is not important. However, when salaries of individuals come from hospital funds there must be a clear understanding as to what services the salaries are paid for, particularly if the staff personnel receiving the salaries are not also faculty personnel. There is now criticism of source and responsibility for expenditures both on the part of the hospital and the medical school because of shortage of money. The medical school criticizes the hospital for not recognizing the tangible as well as the intangible benefits of medical education and research in the hospital and of the services derived from students, residents and teachers; the hospital criticizes the medical school for not paying its way, including the necessary additional costs to the hospital for instruction of the students. Using the Massachusetts General Hospital as an example, it is found that the teaching of undergraduate Harvard medical students at the hospital costs $160,000 of school funds plus an unknown portion of $105,000 of hospital funds plus a small additional outlay for laboratories, teaching rooms and amphitheaters. The interests of the school end with the completion of four years, at which point the interest and responsibility of the hospital increase. Salaries are paid for teaching and research; the salaries vary down to a nominal payment of $100. No one is overpaid. The major portion of money paid by the hospital in salaries is for teaching of the resident staff, executive duties and time spent in research. When a single person occupying positions on both faculty and staff receives salary from both university and hospital, such money is paid for undergraduate teaching of medical students and graduate teaching of interns and residents. In this way economy of manpower is obtained, and both the school and hospital profit by division of salary. In supporting a resident staff the Massachusetts General Hospital does two things: it provides for the best care of patients and provides the final stage in the education of physicians. The costs are high. The total cost for sixty-seven residents is approximately $175,000 a year. For this the hospital gets constant and excellent care of patients, and full time and part time members of the staff are relieved of many duties and thus are allowed further time for research. In the past the total amount has been charged to operating expense of the hospital. The question is raised whether part of this total amount should be carried on a separate budget as a charge toward education. That question still remains unanswered.

DISCUSSION

JOSEPH HINSEY, Ph.D., Dean, Cornell University Medical College, New York: Many additional medical schools should be the recipients of governmental grants. However, grants as now given are for specific purposes and cannot be directed to meeting costs of medical instruction or administration. Such grants oftentimes increase rather than decrease administrative budgets.

Regarding Dr. Faxon's paper it can be said that in general medical schools pay their faculty to teach undergraduate medical schools and to conduct research. Likewise, hospitals pay primarily for the teaching of graduates and for research and executive direction of their services. It is most difficult to set up any standard formula that will allocate costs, as men from clinical staffs do preclinical instruction and the reverse also occurs. I do not agree that the interest of the school ends with the completion of four years of medical school, as medical schools are much involved in training beyond that time, as evidenced recently by demands for help in the training of veteran physicians. The financial difficulties of teaching hospitals is a matter of great concern, inasmuch as maintaining these hospital services on a high plane is required for maintenance of high standards in undergraduate and graduate training.

One is impressed with quantitative needs expressed with regard to present and future needs of medical education in its broadest aspects. Various estimates have been given. As President Alan Valentine pointed out, most if not all of the privately endowed institutions do not have the funds to do the present job, let alone develop along lines that seem required in the future. There is still great need for the information that a survey of medical education can provide. Medical education has never had enough money to support it adequately. Present difficulties are exaggerated by recent inflationary trends. Not all educators regard government subsidy as the proper solution, as such support has great potential danger to higher education. So far support has been received from governmental sources for research in the fields of cancer and psychiatry on terms that many believe to be satisfactory. However, if a satisfactory formula cannot be developed for freedom of action with such support, our medical schools had better stay poor. President Valentine has stated that " the primary and long term objective of private medical schools should be to secure private funds as promptly and as largely as possible. We must act with private enterprise on private enterprise." The public should be fully informed of our problem. It is noted that when governmental funds become increasingly available private foundations turn to other fields. This might occur in medical education.

Motion Pictures in Medical Education

MR. RALPH P. CREER, American Medical Association, Chicago: The use of visual aids in mass teaching received its greatest impetus during World War II. The Bureau of Naval Personnel in " Why Use Training Aids?" showed that students learn 35 per cent more in a given time, remember facts 55 per cent longer and therefore meet high standards in less time. Visual aids were coordinated with teaching programs. During 1946-1947 approximately 55 per cent of the entire medical school population were former service men who had experience with visual aid programs in the armed forces. A survey by the American Medical Association in 1946 showed that forty-four of the schools that responded owned motion picture equipment or had it available to them. The number of projectors was not adequate for all departments. Four schools had silent projectors only. Few schools had access to slide film projectors. Most films were borrowed from commercial or pharmaceutic companies. Replies indicated that the six subjects in which films were most needed were surgery, physiology, pharmacology, anatomy, medicine and pathology. Many schools needed basic films rather than pictures on technic. Northwestern University Medical School reported use of more than five hundred and fifty medical films in one year due to an efficiently established department of medical visual education. It is suggested that in lieu of such a department the medical librarian be responsible for source material on all types of visual aids in medical schools.

A department of visual education has been recently organized in the University of Colorado School of Medicine. Pioneer work in visual education has been carried out in the department of anatomy at Duke University School of Medicine. Student reaction to this type of teaching is highly favorable.

The American Medical Association's Committee on Medical Motion Pictures for promotion and and more widespread use of films offers the following to the medical profession:

1. FILM LIBRARY.--The film library contains one hundred seventy-four copies of forty-six subjects, including basic type films and films for the postgraduate level. Additional films will be purchased in 1948. The only charge for borrowing films is for transportation services. Lists of films are now available on request.

2. SOURCE FILE.--A comprehensive source file of medical films is being compiled, which will be indexed and cross indexed and kept current. Medical school faculty members may apply for information on specific subjects. It is not possible yet to furnish long detailed lists of films on general subjects.

3. SOURCE LIST.--A source list of fifty-eight institutions distributing professional films has been prepared and is available on request.

4. REVIEWS.--Reviews of new films, which are published in THE JOURNAL, include a brief description of the content of the film and recommendation of audience level. Each film is screened by a specialist.

5. CLEARING HOUSE OF INFORMATION.--The committee is also undertaking to serve as a clearing house of all information on medical films for inquiries from both the United States and foreign countries. The committee is now in a position to advise as to the type of films needed by medical schools, medical societies and hospitals.

DISCUSSION

DR, WALTER BLOEDORN, Dean, George Washington University School of Medicine, Washington, D.C.: Audiovisual aids have a place in medical education. However, much depends on their content, quality and ability to become " curriculum integrated." These aids include not only motion pictures but stills, slides, projectors, animated drawings and models.

The Association of American Medical Colleges has through its Committee on Audio-Visual Aids recommended the establishment of a Medical Film Institute to serve as a coordinating agency to carry on this work. This committee has met with the interdepartmental committee composed of representatives of War and Navy Departments, Veterans Administration and United States Public Health Service. The interdepartmental committee will place at the disposal of the Association of American Medical Colleges, who in turn will provide the personnel required to establish and maintain it, a medical film institute.

Audiovisual aids will find their true level in medical education. A new teaching method is sustained not by the enthusiasm of its supporters but only by its true worth, which time alone can assay. These aids should improve medical teaching by (1) transmitting concepts of dynamic phenomena with greater clarity; (2) broadening the experience of the students by increased opportunities for presenting both specialized and diversified laboratory and clinical material; (3) shortening the time required to introduce and demonstrate essentially new and practical technics; (4) permitting more imaginative instructional activity as they provide instructors with a better opportunity to study and profit from the teaching method of others, (5) facilitating the rapid dissemination of information to others, and (6) lessening disparities of training which may exist among institutions with widely varying resources.

Monday Afternoon, 2 o'clock

DR. HERMAN G. WEISKOTTEN, Syracuse, N. Y., Presiding

Teaching the Clinic Aspects of Atomic Energy

DR. ANDREW H. DOWDY, Professor of Radiology, and DR. STAFFORD L. WARREN, Dean, University of California School of Medicine, Los Angeles: In teaching the clinical aspects of atomic energy the objectives are: (1) to train medical students in the biophysical approach to medical problems; (2) to develop a trained reserve pool of medical graduates available in the event of national emergency and to advise and conduct programs pertaining to radioactive contamination of air, water, soil and horticultural products; (3) to participate in graduate training in the fields of radiology, biophysics, radiation chemistry and biology, and (4) to train personnel from the armed services.

A grave responsibility has been added to medical schools; it involves both a moral and patriotic obligation toward the security of the nation. There is hardly a citizen who does not have a vital interest in the proper use or misuse of atomic power. The medical graduate must have a general conception of atomic energy and of its products, nuclear physics, radioactivity, radiation pathology, radiation toxicity and radiobiology. A continued search must be made for an understanding of the action of ionizing radiations on biologic tissues and systems. Efforts must be directed toward effective therapeutic measures which may be employed in the event of exposure. Alterations in present curriculum are therefore necessary. Many curricular difficulties beset the academic future of the clinical aspects of atomic energy. As inadequate salaries are not conducive to the highest scholarship in the field of pedagogy, young talent refuses to choose this profession. This danger threatens not only the elementary schools but colleges and universities. Should this situation continue, professional schools will have entrance classes which are intellectually emasculated. The medical student already has practically reached the saturation point in both the number of subjects and duration of training. He is overwhelmed with numerous clinical and preclinical subjects. Increased length of the training period needed for specialization has resulted in exploitation both by the profession and by hospitals, where interns toil 24 hours a day with no time for the additional training which is being suggested. In spite of that, each medical graduate should possess a minimal knowledge in this new field.

Teaching the clinical aspects of atomic power falls into three categories: (1) premedical, (2) medical and (3) graduate. Premedically, basic training in physics, chemistry, biology and nuclear physics seems imperative from a cultural standpoint alone. In medical school the student must acquire pertinent information on radioactivity, radioactive isotopes, heavy isotopes, radiation biology, radiation toxicity, radiation pathology, radiation detection, ion meters, Geiger counters and the symptomatology and therapeutics of the toxic materials used in making materials employed in atomic piles. A one hour course for one semester during the first year, covering the basic information in nuclear physics and other subjects, seems essential prior to more detailed instruction in the various departments of the medical school. Men from the faculty or trained guest lecturers such as those from the Atomic Energy Commission, U.S. Public Health Service, the armed services, and the Bureau of Standards could supply the needed teaching talent.

Graduate training for the medical student will place the heaviest burden on the young physician who desires special training in radiology or medical biophysics. For those who wish to acquire extra proficiency in this field it seems likely that an extra year of study will be required in addition to the medical or surgical internship and three years' residency in radiology. This additional year of study should follow the completion of and not precede the general radiologic training. Some adjustments in the curriculums of medical schools are necessary if the members of the profession are to meet the challenge of the new era.

DISCUSSION

GEN. GEORGE E. ARMSTRONG, Deputy Surgeon General, United States Army: I feel a sense of responsibility in stimulating as much as possible general interest in any program destined to acquaint physicians with current knowledge of this subject. With few changes in the curriculum and by utilizing appropriate members of the faculty, any medical school can give students the basic instruction necessary to an understanding of nuclear energy. In the latter part of the senior year I recommend perhaps a two day seminar, during which the related basic sciences can be reviewed, interrelated and focused in such a manner as to emphasize the clinical aspects, the attendant hazards and the therapeusis of nuclear casualties.

Medical schools should also take the lead in organizing intensive courses designed to give graduate physicians a minimal knowledge of this subject. Such courses can be condensed into a few days and will alleviate the worry which pervades the profession. I am reliably informed that what every physician should know on "C" Day can be mimeographed on one sheet of paper. But, by the same token, every physician should know the "whys and wherefores" behind these few simple directives.

I ask your assistance in "selling" two concepts to the profession—concepts which are contrary to all previous teachings, yet which are vital to the proper handling of casualties in the event of an atomic catastrophe. The first is that medical personnel must not rush in with the idea of rendering immediate aid to the stricken victims. We must wait until trained technicians consider it safe to enter the radio-contaminated area. The second has to do with the economy of therapeutic means—particularly with the supply of blood. If we are called on to deal with thousands of atomic casualties, about one third of them will in a few hours present symptoms indicative of the gravest prognoses. Blood transfusions and other known therapeutic means will be of no avail. The profession must steel itself to make those persons comfortable and to concentrate every effort to save those who have some chance of survival.

The Teaching of Rehabilitation and Physical Medicine

DR. HOWARD A. RUSK, Professor of Rehabilitation and Physical Medicine, New York University College of Medicine, New York: Although attention has been centered on the disabled veteran as evidence of extensive disability in our population, disability among the civilain population is far greater. Nineteen thousand amputations occurred among military personnel during World War II against 120,000 major amputations among the civilian population. Fifteen hundred men were blinded in military service, but 60,000 civilians lost their sight during this period. Two hundred and sixty-five thousand men were permanently disabled in the war, but 1,250,000 civilians were permanently disabled by diseases and accidents in the corresponding four years. Twenty-three million persons in the United States are handicapped to some extent by disease, accidents and maladjustment, or war.

Rehabilitation pays economic dividends. In one hospital of the Veterans Administration medical rehabilitation service was given 130 chronic neurologic patients, many of whom had not been out of bed in ten years. After nine months all but 10 of the group manifested some worth while permanent improvement. All but a small percentage were made employable and capable of self care. Rehabilitation of this one group was considered to have saved the government over $1,250,000. The Federal Office of Vocational Rehabilitation in 1944, working with 43,997 persons, increased the average yearly wage after rehabilitation to $1,768 per person from a previous average of $148. Many of these persons had been on public assistance at a cost of $300 to $500 annually. The cost of rehabilitation averaged $293 per patient as a single rather than an annually recurring expenditure. Medical rehabilitation takes the patient from the bed to the job and is the dynamic therapeutics of chronic disease. Although it is dependent on the skills of medical specialists, principles of rehabilitation are basic to the practice of medicine. One of its greatest problems is motivation, to encourage and convince the disabled persons that they can rehabilitate themselves. Such motivation can start at the time of the accident or the onset of the crippling disease by allaying fears of the patients and giving courage, understanding and hope predicated on an accurate knowledge of what can be done. It must be recognized that treatment of disease is only part of medical care and that equal emphasis must be given to treatment of the patient as an individual. Integrated programs of convalescent care that stress activity as an adjunct to definitive treatment can reduce the period of hospitalization, offset the deconditioning phenomena of rest in bed and prevent the harmful physiologic and psychologic sequelae which often result through extended hospitalization. Although it seems logical that medical rehabilitation should be an important service of every civilian hospital, there has been little attempt until recently to establish such programs. Rehabilitation in varying degrees is available in some tuberculosis, mental and other specialized hospitals, but little provision has been made for such dynamic care for the more than 14,000,000 persons who are patients in general hospitals each year. The first comprehensive program of this sort in any community hospital in this country has been recently inaugurated at Bellevue Hospital in New York. The service has bed capacity for eighty patients and also operates in much the same manner as the x-ray and laboratory departments as a service for other departments in the hospital. It treats both inpatients and and outpatients on reference from the other services of the hospital. This is the first step in a plan by the Department of Hospitals in the City of New York to provide all patients in municipal hospitals with medical rehabilitation services.

The Department of Rehabilitation and Physical Medicine at New York University College of Medicine is organized as a major department. Activities include training, research and patient care using the services both at the college and at Bellevue Hospital. Undergraduate training consists of a one hour indoctrination lecture in the first year, four hours of lecture demonstration in the second year and six hours of lecture demonstration correlated with the basic sciences of anatomy, physiology and pathology in the third year. Additionally, twenty-two hours of elective classes, lectures, demonstrations and field trips are offered. Clinical clerkships of three months in the third year and two months in the fourth year consist of orientation to the uses of physical modalities in the evaluation of treatment of physical, psychosocial and vocational rehabilitation and therapy. A twelve or twenty-four week course is offered in the postgraduate division, consisting of theoretic and practical training in these same phases. Additionally, part time postgraduate courses can be had through special arrangement. Teaching hospital rounds in which guest specialists have participated regularly have attracted numerous visiting physicians to this important and heretofore relatively neglected phase of good medical care.

DISCUSSION

DR. A. C. IVY, Vice President, Chicago Professional Colleges, University of Illinois, Chicago: As a result of World War I and the work of a number of physicians, particularly in this country and England, physical medicine has achieved a position where it merits definite recognition in the medical curriculum and in therapy. How is it best to present this subject? I have had occasion to study this question in cooperation with Dr. Coulter, of the Department of Physical Medicine at Northwestern University, during a period of years. Obviously we cannot expect our medical students to make physiatrists and experts in rehabilitation at the end of the four year course. However, we can demonstrate to them that physical medicine, including rehabilitation, has a definite scientific basis and what physical medicine and rehabilitation have to offer. In physiology courses at Northwestern, in order to show that physical medicine and rehabilitation have a scientific emphasis, we asked the Department of Physical Medicine to take six hours of our regular laboratory work and two hours of our clinic in applied physiology. In the laboratory they demonstrated the apparatus they use and the physical and chemical principles on which it operates. In the applied clinic in physiology they demonstrated what physical medicine has to offer as far as the applied physiology of muscle disturbances and the applied aspects of neurophysiology, gait and posture are concerned.

At best, the subjects of skeletal muscle and neurophysiology, gait and posture are dry subjects and are disliked by about 80 per cent of the students in any class in physiology. These subjects, however, can be made dynamic and realistic by demonstrating to the students how the basic knowledge of muscle and neurophysiology, gait and posture can be applied to the patient suffering from disease.

These facts should be further emphasized, in my opinion, in the latter part of the junior or during the senior year by setting aside a minimum of eleven or a maximum of twenty-two hours to again demonstrate to the students what can be done by rehabilitation procedures. There are clinical men on the staffs of our university hospitals today who do not know what physical medicine, and particularly rehabilitation, has to offer to many patients who represent that group considered forever unable to earn a living. I have seen in the last six months some 4 patients who were on custodial care returned to a status in which they could earn their own living.

Rehabilitation is something that we are going to have to provide whether we like it or not, because we must realize that the number of disabled persons in this country has been increasing over the years, has been further increased by World War II and will be still further increased by the victims of anticipated automobile accidents. By impressing the members of the medical profession that many of these disabled persons can be rehabilitated so that they can make their own living, we shall be enlarging the humanitarian services of medicine and decreasing the economic burden of the taxpayers.

Preparing the Medical Student for Family Practice

DR. WINGATE M. JOHNSON, Professor of Clinical Medicine, Bowman Gray School of Medicine, Winston-Salem, N.C.: The alarming trend toward specialization in the last few years was given emphasis by the premium placed on specialists in the recent war. Among responsible factors are specialty boards, the tendency of many hospitals to close their doors to noncertified men, pseudoprosperity experienced during and after the war, growing popularity of group practice and, finally, current trends in modern medical education. No more than 18 per cent of the medical population need be specialists. At least two thirds of graduates should plan for general practice. However, in one school 96 per cent of a recent graduating class planned to become specialists. This trend seriously threatens the future of the medical welfare in this country. It must be remembered that during the last depression many physicians were operating taxicabs and elevators. None of these were family physicians. Patients are now complaining that they cannot find doctors who will come to their homes when necessary. Unless public demand is met, politicians who promise free medical care for all will find ready followers and physicians will find themselves ordered to practice when, where and how the government directs.

Recognition of the vital need must bring about a renaissance of the family doctor. The Council on Medical Education and Hospitals has encouraged formation of general practice sections in hospital staffs and has discouraged hospitals from closing their doors to physicians not certified by boards. The General Practitioner's Award, the "Grass Roots Conference" and many other activities of the officials of the American Medical Association have stimulated interest in this renaissance. Medical schools can play an important and encouraging part in preparing students to enter general practice. A poll of the graduating class of the Bowman Gray School of Medicine in December 1947 revealed that only eight (one sixth) of its members expected to specialize, another one sixth were undecided and the remaining two thirds expected to be family physicians. Therefore, the renaissance of the family physician is under way.

Of certain factors which have helped attract these students to family practice, the most important is the actual teaching program. Emphasis is placed on consideration of the whole man. In the belief that "responsibility teaches" the student is given early responsibility for care of patients under supervision. In the fourth year the class is divided into three sections; medicine, surgery and specialties. Since almost every senior after the first year or two has elected private medicine, service cases have been left to third year students and medical house staff. Most students respond so well to responsibility that the patients frequently consider the students as their doctors. Physicians in attendance make it a point to have students present when they talk to the family, especially during the summing up of the case. In short, every effort is made to have the student learn the art as well as the science of medicine. A special course in family practice of one hour a week is attended by both junior and senior students. This class combines the old didactic lecture and the modern bedside clinic. This course is made as informal as possible. Students are encouraged to interrupt with questions at any time and to challenge statement or diagnosis; no infallibility is thrown about the teacher nor effort made to bluff the student. Cases selected for presentation are typical of those seen in general practice. Some cases are purely functional, some organic, some mixed, and the student handling the cases is made to dig in the history of the patient until the mental focus in cases of psychoneurosis is found by tactful questioning. Occasionally, for the good of his soul and the benefit of the student, the teacher presents one of his own mistakes in diagnosis or therapy. All through the course an effort is made to emphasize the importance of the history and the physical examination. A preceptorship system has been inaugurated wherein, due to the fact that classes are graduated in December while most hospital appointments begin in July, a large number of graduates accept a preceptorship under a family physician. Since they have the rights and privileges that go with licensure, they become real assets to the preceptors. This practice encourages young men to become family physicians themselves.

Preparing the Intern for General Practice

DR. MYRON McDONALD WEAVER, Assistant Dean, University of Minnesota Medical School, Minneapolis: The majority of recent medical graduates hesitate to enter practice without special training because they do not feel they are qualified to do so after a one year internship. Their feeling of inadequacy arises from the impossibility of mastering the required medical knowledge in five years. Two years ago Dr. William A. O'Brien recommended that (1) there be a redistribution of emphasis in the curriculum of the four year medical course, with relatively more attention to internal medicine, medical specialties, obstetrics and pediatrics, due regard for medical aspects of surgical specialties, and that technical aspects of surgery be left for the graduate years. (2) Recent medical graduates should be able to avail themselves of an internship that offers special training for general practice beginning with a full year in medicine and the medical specialties followed by a second year in obstetrics, pediatrics and some aspects of surgery. A number of such internships are administered by the University of Minnesota Medical School. Students expressed interest in the type of internship under consideration. In 1947 a reaction in favor of general practice was noted among upper classmen of the medical school. The high tide of interest in specialization was reached in the late war, and since then a reaction toward general practice warrants special arrangements for intern training specifically designed to meet this need. A preceptorship program to introduce graduating seniors to general practice was entered into by nine of the seventy-two members of the class graduated in August 1947. These were arranged in cooperation with the Minnesota State Medical Association. Graduates went to preceptors serving in relatively small communities scattered throughout Minnesota. Most preceptorships are for a term of nine months preceding regular internships. Both preceptors and former students were gratified by the arrangement. Hospital facilities for the type of internship discussed were arranged in the university hospitals and in Minneapolis General Hospital. Although difficulties were met in arranging this type of internship, problems in most instances were met and solved. Characteristics of hospitals entering the program were (*a*) good staff representation from the faculty of the medical school, (*b*) good staff representation by leading general physicians in the area as well as diplomates of specialty boards, (*c*) provision for residency training approved by the Council on Medical Education and Hospitals and (*d*) notable interest of the staff toward participation in intern training.

There are advantages in this type of training from the point of view of the intern: (1) two full years of good hospital experience: (2) responsibilities which are seldom accorded rotating interns; (3) experience with types of patients and stages of disease which are encountered in both public and private hospitals; (4) valuable types of experience with hospital administration, and (5) opportunity to return to the medical school for regular medical-surgical-pathologic conferences and other exercises.

Certain administrative problems for participating hospitals were discussed, including a guaranty that service will be continued, noninterference with current routine internships and variability of stipends. Administratively, the medical school must select the interns to be appointed for the two year service. Arrangements must be made to accredit the second year of internship toward certification with a specialty board. Arrangements must be made for recognition of the internship by the medical school and by medical licensure boards of the various states. Rather than have hospitals issue separate internship certificates the medical school must issue a certificate that covers the full period of training. The greatest problems were posed by students who requested substitution of one service for another which was originally called for on the schedule. This program of two year internships for general practice is considered to be still in the experimental stage, and results will be appraised later when its value to the future general practitioner may be determined. In general, the opinion of all concerned in Minnesota was that two years of some type of hospital training other than that usually afforded by the rotating internship is required to fit the recent graduate in medicine for general practice.

DISCUSSION ON PAPERS BY DRS. JOHNSON AND WEAVER.

DR. KARL MEYER, Medical Superintendent, Cook County Institutions, and Chairman, Committee on General Practice, Chicago: Unless medical schools and hospitals begin at once to train sizable groups of graduates each year for family practice, some other agency will force this issue to the embarrassment of organized medicine. An internship that will develop good family physicians must be long enough to give good working knowledge of all the specialties. This is favored by a two year rotating internship, which will permit men to carry out the minor services in these specialties and at the same time help them decide where and when the service of a specialist is needed. Family practice need not become just a clearing house for patients, as the majority of ills can be handled by a graduate of an approved medical school who has had a good rotating internship of preferably not less than eighteen months. It was noted that the greatest deficiency in medical teaching lies in the department of therapeutics. Courses in prescription writing based on Useful Drugs would be most important. Because of this lack of knowledge among new graduates there is a large amount of useless and sometimes harmful medication prescribed. Such training should be emphasized during the internship. As the general practitioner is on the front line of medical practice, he should constantly have available to him short courses relating to the newer developments in medicine. Likewise, inasmuch as study of the basic sciences still constitutes the basis for modern medicine, the general practitioner should have opportunity for refresher courses to bring him a fuller view of what medicine can accomplish and where efforts can be directed to improve the general health of the community. Finally, attendance at necropsy and pathologic conferences is necessary, as only a physician who has never followed his patients to the necropsy table can remain smug in his appraisal of his own diagnostic ability.

DR. WARD DARLEY, Dean, University of Colorado School of Medicine, Denver: I think we must recognize that specialization has been a necessary and beneficial development and that it is here to stay; but it is hard to visualize a comprehensive and satisfying type of medical care that will be dependent entirely on specialists or groups of specialists. It is essential that someone in the medical family be prepared to fill the gap between the patient as a person and his occasional needs for a specialist. Some say this individual should be the general practitioner and some say he should be the internist. Be this as it may, our scheme for medical care has a place for a person who is fundamentally trained as a physician and all that name implies. The answer lies in the fundamental training of this basic physician. First, the problem should be approached from the standpoint of the selection of medical students. Here the important question of motivation comes up for assessment, and unfortunately at present this is most difficult. I wish that motivation could be estimated as easily as aptitude and scholastic ability.

After the medical student is selected, before he is oriented to pathology, he should be oriented to the health person, to medicine as human biology. He should be trained to be critical. A research attitude should dominate his methods and thinking. Every effort should be made to challenge the student's interest in personal as well as in community preventive medicine. He should approach medicine with the idea of being a health counsellor or a health coordinator from birth to death. He should certainly be well oriented in the field of psychosomatic medicine and in the sciences that are basic in clinical psychiatry, psychobiology and psychopathology.

Orientation of the medical student to human disease or to human biology as medicine should be grafted on the appreciation of normal human development and on good health and and its preservation. This clinical training should put considerable emphasis on diagnosis so that limitations can be recognized accurately and so that referral to the specialist can be approached intelligently.

Dr. Lester Evans' concept of physician training is well expressed about as follows: The training and educational experience of every physician should emphasize the concept of continued medical care of the individual, and this means that the physician's primary interest should center around the care of the ambulant patient. The patient should get away from the idea that the hospital is the center of medical practice. He should believe that the care of the ambulant patient is the important aspect and that hospitalization is something incidental to this care.

The medical cults and quacks have always profited by adherence to this concept of continuing care of the ambulant patient, and it is largely because of this that they manage to hold the interest and support of a large segment of the population.

We have tried to approach the problem at all levels: premedical, undergraduate, intern, graduate and postgraduate. We are still interested in training specialists, but we are also interested in offering a graduate training program for the general practitioner, the family physician, the general physician - call him what you may.

National Emergency Medical Service

DR. HAROLD DIEHL, Dean, University of Minnesota, Minneapolis: As a member of the Council on National Emergency Medical Service I will say a few words concerning its organization and its relation to medical education. After World War II the House of Delegates of the American Medical Association established a Committee on National Emergency Medical Service to review the experiences on the use of medical personnel and the medical resources of the nation during that war. That committee worked for several years making a study and analysis of the use of medical personnel by the armed forces. The committee made its final report to the House of Delegates of the American Medical Association at its meeting in Atlantic City, N. J., last spring.

The final recommendation of the Committee of National Emergency Medical Service was that the American Medical Association create a standing committee of the Board of Trustees to be known as the Council on National Emergency Medical Service. The function of this council is to continuously study and make plans for the provision of medical services in case of a national emergency and to bring the thinking and the planning of the physicians of this country to the attention of the officials of our government in Washington, D.C., and our representatives in Congress. The Council was appointed during the summer of 1947

This council has been organized and has made contact with the Secretary of Defense and other agencies in Washington that are concerned with planning for national defense. On every hand it has been given the best possible assurances of cooperation. We all hope that such a national emergency will not arise, but with the possibilities of atomic and bacteriologic warfare we are convinced that if it should arise, the medical resources and medical personnel of our nation must be used with the greatest possible effectiveness if our nation is to survive. The council requests suggestions of any members of the profession in making these plans.

THE FEDERATION OF STATE MEDICAL BOARDS

DR. MORRIS FISHBEIN, Chicago, read a paper on "Medical Education in Latin America," which appears in full in this issue of THE JOURNAL

Tuesday Morning, 9:30

Educational Indigestion

DR. R. N. WHITFIELD, Assistant Secretary, Mississippi State Board of Health, Jackson: Too many young men and women are not properly trained before they enter medical schools. The first grade through high school are noted as the critical years of education, during which habits of study are acquired. In spite of the high cost of education in the United States to the individual family, a large proportion of boys and girls still cannot spell, read or write and cannot use the English language correctly; they cannot speak coherently in public gatherings and are ignorant of many items of common knowledge.

Prospective physicians are not being thoroughly taught the basic elements of education. They are hurried through a curriculum far too advanced for elementary and high school courses. Many subjects now taught in high school could be dropped and later taught in college. Many high school textbooks contain over a thousand pages where three hundred would suffice. Many textbooks used in the first twelve grades fail to use language which may be coupled to the knowledge of the elementary student. A break in continuous schooling from first grade to medical specialist or Ph.D degree is advised. A person who spends nearly twenty-five years continuously in school is not altogether practical and probably is out of harmony with the world in which he must live.

We will go further and succeed better if common sense business ideas rather than too much theory prevail in our educational system. Time should be spend on training in fundamentals, and scientific subjects such as chemistry and biology can best be taught in college, the resultant free time being used to perfect the knowledge of fundamental subjects.

An Analysis of Basic Science Laws

DR. WALTER L. BIERRING, Secretary, Federation of State Medical Boards of the United States, Des Moines, Iowa: Basic science requirements underlying the practice of the healing arts have been established in seventeen states, the District of Columbia and the Territory of Alaska.

The basic science subjects in which examination are conducted are specified by statute. The examining boards are not authorized to add any subjects or to refrain from giving an examination in any subject specified by law. All nineteen boards examine in anatomy, physiology and pathology; seventeen of them examine in chemistry; fifteen in bacteriology; nine in hygiene; one in public health, and two (Wisconsin and Connecticut) in diagnosis. The two original boards continue to include diagnosis as one of the basic sciences; the recognition of pathologic conditions is evidently considered a basic requirement for medical practice.

Three boards - Wisconsin, Connecticut and Rhode Island - have three members each. Thirteen boards - Alaska, Arizona, Arkansas, Colorado, District of Columbia, Florida, Michigan, Minnesota, Nebraska, New Mexico, South Dakota, Tennessee and Washington - have five members; boards of Iowa and Oregon have six members and the Oklahoma board has seven. The terms of service vary between three, four, five and six years. The basic science boards of Colorado, Minnesota, New Mexico, Oklahoma and South Dakota comprise one representative from each of the three healing arts, and on the Alaska board there are two doctors of medicine, one doctor of osteopathy and one chiropractor, as well as one layman.

On nine boards-Arizona, Connecticut, Florida, Iowa, Michigan, Nebraska, Oregon, Washington and Wisconsin- there is no M.D., D.O. or D.C. represented in the membership. In Arkansas and Rhode Island the physician member is a professor of pathology, and in Tennessee a professor of bacteriology. A veterinarian is a member of the Colorado and Florida boards; a doctor of dental surgery and a dean of the School of Public Health are members of the Michigan board; and the dean of the State University School of Medicine is secretary of the Tennessee board. Lay members are represented on the Alaska, Connecticut and Rhode Island boards. A teacher of bacteriology in a college or university is a member on five boards, and a teacher of pathology is a member on eight boards. A professor of physical hygiene is a member of the Washington board.

The requirements for admission to the basic science examinations are more or less uniform. The age requirement is 21 years, with two exceptions; in Nebraska it is 17 years and in Oklahoma, 19. Citizenship is required in Alaska, Florida, Oklahoma, Rhode Island, South Dakota and Tennessee.

Graduation from an approved high school or its equivalent is required by all existing basic science laws except those of Rhode Island and the District of Columbia. The Rhode Island Basic Science Law enacted in 1940 has the additional requirement of one year of preprofessional collegiate education in an accredited college and two years of professional training in the basic sciences.

In twelve states the grade required for passing each individual subject is 75 per cent. In four states — Iowa, Oklahoma, Oregon and Washington — and the District of Columbia the grade required for passing is 70 per cent and the general average, 75 per cent. Connecticut requires only 60 per cent for passing individual subjects and 65 per cent for the general average. In 1944 there were 2763 applicants examined by eighteen basic science boards with an average of 22.4 per cent of failure. The percentage of failure for physicians and medical students of 18.2, 16.4 and 18.7, respectively, for three years seems high. The comparative results in some states seem to indicate that the sifting process of the basic science board examination eliminated the less adequately prepared medical graduates and definitely reduced the number of failures in the licensure examination. The basic science laws of Washington and Florida do not permit reciprocity with any outside examining board. The remaining seventeen boards enter into some form of reciprocity with each other. Michigan and Minnesota apparently do not enter into reciprocity with a basic science board where the required passing grade for each subject is below 75 per cent. Eight basic science boards accept the grades in the basic sciences obtained in a state licensure examination. In seven other states the law authorizes such a waiver but for various reasons it is not exercised. The certificate of the National Board of Medical Examiners is accepted by nine basic science boards; Alaska, Arkansas, Connecticut, Iowa, Minnesota, Nebraska, Oklahoma, Tennessee and the District of Columbia. The Washington State Board of Medical Examiners accepts the national board certificate, while the basic science board of the State does not. In Arizona, Arkansas, Colorado, Connecticut, Iowa, Nebraska, New Mexico, Oregon, South Dakota and Wisconsin credit is not allowed by the state board of medical examiners for grades received in the examination of the basic science board, the basic sciences being included as separate subjects in the licensure examination. The nineteen existing basic science laws have evidently been enacted by legislative action without regard to any national pattern or uniformity in procedure of operation. The great difference in the type and character of the previous educational training of the personnel comprising the membership of the basic science boards will always make it difficult to harmonize the examination procedure, particularly as a prerequisite for license to practice one of the healing arts. As previously stated, the character of the examination questions in the different basic sciences has undergone remarkable changes, assuming more and more the type adaptable for a licensure examination, especially that of the practice of medicine. The evident original purpose of enacting basic science laws as a prerequisite for licensure in the healing arts was to exclude chiropractors, and other inadequately trained practitioners from being admitted to licensure. The number of chiropractors appearing before basic science boards is decreasing each year. In 1946 only forty known chiropractors were examined. The training of osteopaths in the basic sciences is gradually improving, yet the percentage of failures before basic science boards is still about 40 per cent. In 1946, one hundred and ninety-six osteopaths were examined by basic science boards.

Under the sponsorship of the Council on Medical Education and Hospitals of the American Medical Association, the Association of Americal Medical Colleges and other professional educational agencies, medical education in America has been established on a uniform university basis. It is within the power and opportunity of the existing boards of examiners in the basic sciences to profoundly influence and advance the standards of medical education and licensure in this country, if they choose to do so.

DR. IRVING S. WRIGHT, Associate Professor of Clinical Medicine, Cornell University Medical College, read a paper on "Medical Education in New York, Germany and Austria," which appears in full in this issue of THE JOURNAL.

DR. JACOB L. LOCHNER JR., Secretary, Albany, New York, State Board of Medical Examiners, read a paper entitled "Licensure Evaluation of European Medical Graduates," which appears in full in this issue of THE JOURNAL.

Recent Legislation Affecting Medical Licensure

DR. J. W. HOLLOWAY Jr., Bureau of Legal Medicine, American Medical Association, Chicago: There have been three recent court decisions affecting licensure.

1. *Davis et al. v. Beeler, Attorney General et al.* decided by the Supreme Court of Tennessee Nov. 29, 1947.—An indictment was returned against members of the board of naturopathic examiners and others charging conspiracy to violate the laws of the state in that the defendants combined to effect the licensure of unqualified persons. Twenty-seven defendants were indicted, eighteen entered pleas of nolo contendere, and fines were imposed ranging from $100 to $1,000. Prior to imposition of fines the legislature had repealed the naturopathic act and forbidden previous licencees from practice. Fines only were considered justified because the state was not put to the expense of trial.

A subsequent proceeding in equity instituted by a number of naturopaths to declare invalid the legislative action was denied on Nov. 29, 1947 by the Supreme Court of Tennessee, which sustained in its entirety the legislative action. Evidence was that the legislature thought there was too much "border lining" in the practice of naturopathy and was determined to stamp out the evil which was practiced to the definite injury of credulous sufferers.

2. *Board of Medical Registration and Examination of Indiana v. Peter S. Kaadt.*—Kaadt's license was revoked by the board following a charge of gross immorality in connection with his practice. Kaadt, operating the Kaadt Diabetic Institute and holding himself out to be a specialist in diabetes, was considered by the court to know that the treatment which he was offering was not a cure or proper remedy for diabetes and therefore to be guilty of a scheme to defraud. Kaadt maintained that this attitude would have a crippling effect on the advance of medical science in that it would prevent use of new remedies. The court disagreed, saying that the physician is not specifically limited to all generally approved treatments but that new methods of treatment should pass through an experimental stage of development and that a physician is not authorized to try untested experiments on patients. Kaadt was considered sufficiently educated in his profession that his acts could not be considered mistakes arising out of inexperience or lack of knowledge. The court believed that there was sufficient evidence to support the finding of the board, and the order of revocation was sustained.

3. *Jaffee v. State Department of Health,* decided by Superior Court, Hartford County, Conn., Dec. 8, 1947.—The State Department of Health revoked Jaffee's license on the finding that he treated a patient in a fraudulent, dishonorable, unprofessional and incompetent manner. Jaffee contended that there was no expert testimony to prove this. The court disagreed with Jaffee's contention and held in effect that members of the board of examiners were justified in relying on their own specialized knowledge as to whether the facts presented to them constituted treatment in a fraudulent, dishonorable, unprofessional and incompetent manner. The court concluded that there was no evidence that the board violated rules of law or acted illegally, arbitrarily, capriciously or in abuse of its discretion. The revocation was sustained.

New legislation before state legislatures includes a Massachusetts bill (H. 703) for establishment of the University of Massachusetts in Boston to include a medical school and a similar bill in New York (A. 348) to establish in the city of New York an Empire State University in which will be a school of medicine. Mississippi also contemplates a bill (H. 24) to construct an accredited four year medical school. Recent legislation introduced in Congress would specifically qualify for licensure in the District of Columbia applicants who hold certificates from the National Board of Medical Examiners.

The Importance of Potassium.—Abundant evidence is available indicating the importance of potassium for the normal functioning of nervous tissue. The energy rich carbohydrates and organic phosphates exist and function in nervous tissue much as they do in muscle tissue, and the dependence of them upon potassium can be assumed. There is some evidence in support of this. Potassium, is also, known to play an important role in the release of acetylcholine and has been found essential for the resynthesis of choline acetylase, an enzyme essential for the synthesis of acetycholine. Its importance in the transmission of the electrical impulse along nerve fiber or across the myoneural junction is generally recognized. Gass, Cherkasky, M., and Savitsky, N.: *Medicine,* February 1948.

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

NATIONAL BOARD OF MEDICAL EXAMINERS EXAMINING BOARDS IN SPECIALTIES

Examinations of the National Board of Medical Examiners and the Examining Boards in Specialties were publish- in the JOURNAL, April 17, page 1064.

BOARDS OF MEDICAL EXAMINERS

ALABAMA: Examination. Montgomery, June 22-24, 1948. Sec., Dr. D. G. Gill. 519 Dexter Ave., Montgomery 4.

ARKANSAS:* Examination. Little Rock, June 3-4. Sec., Medical Board of the Arkansas Medical Society, Dr. L. J. Kosminsky, Texarkana. Eclectic: Little Rock, June 3. Sec., Dr. C. H. Young. 1415 Main St., Little Rock.

CALIFORNIA: Oral. San Francisco, June 5-6; Los Angeles, Aug. 7-8. Written Examination. San Francisco, June 7-10. Los Angeles, Aug. 9-12. Oral and Clinical Examination for Foreign Graduates. San Francisco, June 6. Sec., Dr. Frederick N Scatena, 1020 N. Street, Sacramento 14.

COLORADO:* Examination. Denver, June 21-23. Final date for filing application is June 5. Sec., Dr. J. B. Davis, 831 Republic Bldg., Denver.

DISTRICT OF COLUMBIA:* Examination. May 10-11. Sec., Commission on Licensure, Dr. G. C. Ruhland, 4130 E. Municipal Bldg., Washington.

FLORIDA:* Examination. Jacksonville, June 29-30. Sec., Dr. Harold D. Van Schaick, 6675 Windsor Lane, La Gorce Island, Miami Beach 41.

GEORGIA: Examination. Atlanta, June 8-9. Endorsement. June 10. Sec., Mr. R. C. Coleman, 111 State Capitol, Atlanta.

ILLINOIS: Chicago, June 29-July 1. Supt., Dept. of Registration and Education, Mr. Fred W. Ruegg, Springfield.

INDIANA: Examination. Indianapolis, June 15-17, 1948. Sec., Board of Medical Registration and Examination, Dr. Paul R. Tindall, 416 K. of P Bldg., Indianapolis.

KANSAS: Kansas City, June 9-10. Sec., Board of Medical Registration & Examination, Dr. J. F. Hassig, 905 N. 7th St., Kansas City.

KENTUCKY: Examination. Louisville, June 16-18. Sec., Dr. P. E. Blackerby, 620 S. 3rd St., Louisville.

MARYLAND: Medical Examination. Baltimore, June 15-18. Sec.-Treas., Dr. Lewis P. Gundry, 1215 Cathedral St., Baltimore. Homeopathic Examination. Baltimore, June 15-16. Sec., Dr. J. A. Evans, 612 W. 40th St., Baltimore.

MICHIGAN:* Examination. Parlor A, Olds Hotel, Lansing, June 9-11. Sec., Board of Registration in Medicine, Dr. J. E. McIntyre, 100 W. Allegan St., Lansing.

MISSISSIPPI: Jackson, June 28-29, 1948. Asst. Sec., State Board of Health, Dr. R. N. Whitfield, Jackson.

MISSOURI: Examination. St. Louis, May 24-26. Final date for filing application is April 24. Exec. Sec., Mr. John A. Hailey, State Capitol Bldg., Jefferson City.

NEBRASKA:* Examination, Omaha, June 7-9. Dir., Mr. Oscar F. Humble, Room 1009 State Capitol Bldg., Lincoln 9.

NEVADA: Carson City, May 3. Sec., Dr. G. H. Ross, 215 N. Carson St., Carson City.

NEW HAMPSHIRE: Concord, Sept. 9. Sec., Board of Registration in Medicine. Dr. J. S. Wheeler, Room 107, State House, Concord.

NEW JERSEY: Examination, Trenton, June 15-17. Sec., Dr. E S. Hallinger, 28 W. State St., Trenton.

NEW YORK: Examination. Various Centers, June 28-July 1., Sec., Dr. J. L. Lochner Jr., State Education Bldg., Albany.

NORTH CAROLINA: Endorsement. Pinehurst, May 4. Sec., Dr. Ivan Procter, 226 Hillsboro St., Raleigh.

NORTH DAKOTA: Grand Forks, July 6-9. Sec., Dr. G. M. Williamson, 4½ S. 3rd St., Grand Forks.

OHIO: Examination. Columbus, June 21-24. Sec., Dr. H.M. Platter, 21 W. Broad St., Columbus 15.

OKLAHOMA:* Oklahoma City, June 2-3. Sec., Dr. Clinton Gallaher, 813 Braniff Bldg., Oklahoma City.

OREGON:* Examination. July and Jan. Sec., Miss L.M. Conlee, 608 Failing Bldg., Portland.

PENNSYLVANIA: Examination. Philadelphia & Pittsburgh, July. Act. Sec., Bureau of Professional Licensing, Mrs. M. G. Steiner, 351 Education Bldg., Harrisburg.

SOUTH CAROLINA: Written Examination. Columbia, June 21-23. Endorsement. May 3. Sec., Dr. N. B. Heyward, 1329 Blanding St., Columbia.

SOUTH DAKOTA:* Pierre, July 20-21. Sec., Dr. Gilbert Cottam, Capitol Bldg., Pierre.

TENNESSEE:* Examination. Memphis & Nashville, June 9-10. Sec., Dr. H. W. Qualls, 1635 Exchange Bldg., Memphis.

TEXAS: Waco, June 16-18. Sec., Dr. H. F. Conwally, 1305 Amicable Bldg., Waco.

UTAH: Examination. Salt Lake City, June, 1948. Asst. Dir., Department of Registration, Miss Rena B. Loomis, 324 State Capitol Bldg., Salt Lake City.

VIRGINIA: Examination. Richmond, June 18-19. Endorsement. Richmond. June 17. Sec., Dr. K. D. Graves. 306 Medical Arts Bldg., Roanoke.

WEST VIRGINIA: Charleston, July 5-7. Comm., Public Health Council, Dr. N. H. Dyer, State Capitol Bldg., Charleston.

WISCONSIN:* Milwaukee, June 29-July 1. Sec., Dr. C. A. Dawson, Tremont Bldg., River Falls.

WYOMING: Examination. Cheyenne, June 7. Sec., Dr. G. M. Anderson, Capitol Bldg., Cheyenne.

* Basic Science Certificate required.

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

ARIZONA: Examination. Tucson, June 15. Sec., Mr. Francis A. Roy, Univ. of Arizona, Tucson.

ARKANSAS: Little Rock, May 4. Sec., Mr. L. E. Gebauer, 1002 Donaghey Bldg., Little Rock.

COLORADO: Examination. Denver, June 2-3. Sec., Dr. E. B. Starks, 1459 Odgen St., Denver.

CONNECTICUT: Examination. June 12., Exec. Asst., Mr. W. G. Reynolds, 110 Whitney Ave. New Haven 10.

FLORIDA: Examination. June 5. Final date for filing application is May 23. Sec., Mr. M. W. Emmel, Univ. of Florida, Gainesville.

IOWA: Des Moines, July 13, Oct. 12. Sec., Dr. Ben H. Peterson, Coe College, Cedar Rapids.

MICHIGAN: Examination. Ann Arbor and Detroit, May 14-15. Sec., Miss Eloise LeBeau, 101 N. Walnut St., Lansing 15.

MINNESOTA: Examination. Minneapolis, June 1-2. Sec., Dr. Raymond N. Bieter, 105 Millard Hall, Univ. of Minnesota, Minneapolis.

NEBRASKA: Examination. Omaha, May 4-5. Dir., Bureau of Examining Boards, Mr. Oscar F. Humble, Room 1009 State Capitol Bldg., Lincoln 9.

NEW MEXICO: Examination. Santa Fe, May 2. Sec., Miss Marguerite Kilkenny, State Capitol Bldg., Santa Fe.

OREGON: Examination. Portland, June 19. Final date for filing application is June 2. Sec., Basic Science Examining Committee, Dr. C. D. Byrne, Univ. of Oregon, Eugene.

RHODE ISLAND: Examination. Providence. May 12. Chief, Div. of Professional Regulation, Mr. Thomas B. Casey, 366 State Office Bldg., Providence.

SOUTH DAKOTA: Examination. Vermillion. June 4-5. Sec., Dr. G. M. Evans, 310 E. 15th St., Yankton.

TENNESSEE: Examination. Memphis, July 5-6. Sec., Dr. O. W. Hyman, 874 Union Ave., Memphis.

WISCONSIN: Examination. Milwaukee, June 5. Final date for filing application is May 29. Sec., Prof. W. H. Barber, Scott & Watson Sts., Ripon.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1937 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied with stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted.

Electrocardiographic Diagnosis of Right Ventricular Hypertrophy. G. B. Meyers, H. A. Klein and B. E. Stofer.-p.1.

Variations in Deviations of S-T in Anterior Wall Infarction. W. Dressler and H. Roesler.-p. 58.

*Spinal Nerve Root Pain (Radiculitis) Simulating Coronary Occlusion: Common Syndrome. D. Davis.-p. 70.

*Extrasystoles in Groups. D. Scherf and F. J. Romano.-p. 81.

*Use of Dicumarol in Experimental Coronary Occlusion. I. Ineffectiveness of Dicumarol When Ligation is Method of Occlusion. E. J. Beattie, E. C. Cutler, M. Fauteux and others.-p. 94.

Clinical Analysis of S Wave Pattern Electrocardiogram. Investigation Including Extensive Unipolar Lead Studies. J. Fershing and L. A. Baker.-p. 106.

"Angiomesohyperplasia": Generalized Noninflammatory Occlusive Arterial Disease. T. Ray, H. K. Stauss and G. E. Burch.—p. 117.

*Rupture of Heart Following Acute Myocardial Infarction. Incidence in Public Hospital, with 5 Illustrative Cases Including One of Perforation of Interventricular Septum Diagnosed ante Mortem. R. S. Diaz-Rivera and A. J. Miller.—p. 126.

Paroxysmal Auricular Tachycardia at Rate of 86 per Minute: Report of Case. R. Miller, D. Biber and J. S. Perelman.—p. 134.

Wolff-Parkinson-White Syndrome in Case of Congenital Heart Disease. M. H. Stein.—p. 140.

Spinal Nerve Root Pain Simulating Coronary Occlusion.—Davis states that dorsal spine radiculitis with acute attacks of anterior thoracic pain may simulate coronary artery disease. Histories of 10 patients who had pain in the chest characteristic of coronary disease are presented. Attacks were often confined to the substernal or precordial regions. Pain was frequently severe, prolonged and described as a pressure sensation, a heaviness, a viselike constriction or an expanding discomfort. Pain radiated to the left upper extremity and to the neck, accompanied by a choking sensation. Occasionally it radiated to the jaw, and in a few instances severe attacks were accompanied with pallor and excessive perspiration. Several patients complained of respiratory distress. Attacks occurred (1) in bed at night; (2) after certain movements of the spine, such as bending, turning from side to side or getting out of bed, and (3) after such acts as coughing, sneezing, or straining at stool or after prolonged sitting. Most important diagnostically was the reproduction of attacks by pressure over the dorsal vertebrae. Such attacks, although short in duration, could be reproduced in many patients with recent acute symptoms. Induced pain had the same location, distribution and character as in spontaneous attacks. Poor posture, spasm of the posterior cervical muscles and tenderness in the region of the costochondral junctions of ribs and sternum were present in many patients. Diagnosis was confirmed in some by the striking response to therapy consisting of postural correction, bed boards, exercises and, particularly, manipulation and traction of the cervicodorsal spine.

Extrasystoles in Groups.—Scherf and Romano say that two beats following each other within a short time and separated from the next identical group by a longer diastole are classified among the allorhythmias called bigeminy, or coupled beats. This term, coined prior to the electrocardiographic era, includes at least three separate disturbances. There is the succession of groups in which each beat of the basic rhythm is followed by a premature contraction; in this instance the term bigeminy as a synonym for coupled rhythm is generally accepted. A second form was recognized with the aid of the electrocardiograph as due to an auriculoventricular block, and the third disturbance is a rare condition which Wenckebach named true bigeminy. In this type both beats of each group look alike in the electrocardiogram, for they originate in the same focus.

Instances of alteration of cycle length during an auriculoventricular nodal tachycardia and during a paroxysmal ventricular tachycardia in man are described. In the latter case a similar phenomenon was observed during the change from the tachycardia to sinus rhythm following an intravenous injection of quinine. Application of barium chloride or strophanthin to small areas of the cardiac surface of the dog also caused groups of extrasystoles separated by longer pauses. Arrhythmias were often elicited during vagus and following sympathetic stimulation in these experiments. Finally, the phenomenon was observed during warming of the site of origin of extrasystoles produced by subepicardial injection of strophanthin. Similar observations in the literature are discussed.

"Dicumarol" in Experimental Coronary Occlusion.—Successful use of anticoagulant therapy in certain other thrombotic or thromboembolic disease states has stimulated trial of a similar approach to the treatment of acute coronary thrombosis. Beattie and his co-workers determined the effect on experimental coronary artery occlusion of anticoagulant therapy begun after the thrombotic process had begun. Experiments were performed on 40 healthy dogs. At first, attempts were made to produce thrombosis by crushing the artery. At later experiments ligation was used exclusively. Evidence that "dicumarol" has a favorable effect on the evolution or outcome of established experimental myocardial infarction was lacking. However, the authors call attention to the limitations of the experiments.

Rupture of Heart in Myocardial Infarction.—Diaz-Rivera and Miller report that among 1,250 necropsies performed at the Louisville General Hospital during the five years from 1939 to 1944, a total of 147 cases presented myocardial infarction. Of these 94 were old infarcts and 53 were fresh infarcts. In recent infarction, 5 patients died from rupture of the heart. In 4, perforation of the left ventricle occurred, and in 1, rupture of the interventricular septum. Rupture of the interventricular septum was recognized ante mortem. Diagnosis was based on history of severe anginal pain, the sudden appearance of a systolic murmur which rapidly increased in intensity and electrocardiographic evidence of myocardial infarction and right axis deviation. In every instance of rupture of the left ventricle, antemortem clotting in the pericardial sac was observed. It is evident that in the majority of the patients death did not occur instantaneously with cardiac rupture.

Note on Cranial Autoplasty. H. P. Pickerill.—p. 204

Papillomatous Disease of Renal Pelvis.—Macalpine reviews 19 cases of papillomatous disease of the renal pelvis which were collected over a period of twenty-nine years. The patients have been carefully followed, making it possible to take a long term view and to judge the remote results. The author thinks that tumor cells found in the urine and a papilloma protruding from the ureter as seen cystoscopically is the only unmistakable evidence of a papilloma of the upper urinary passages. Many renal papillomas are clinically indistinguishable from the commoner hypernephromas. Pyelograms are frequently helpful, showing a characteristic filling defect, possibly with a crenated margin. A few cases simulate calculous disease or hydronephrosis. Without a correct diagnosis, the ureter will not be removed and a ureterectomy will be required subsequently. The correct treatment is ureteronephrectomy. If the nature of the disease is known beforehand the passages will not be opened, as papillomatous material would be implanted in the wound, where it invariably takes on cancerous propensities, as illustrated by 4 cases in this series. The terminal ureter is usually more heavily involved than any other part of that tube. It must be cut flush with the bladder, and means must be employed to insure the destruction of seedlings within the intramural ureter. It is unwise to remove a disk of the bladder, because: (*a*) this materially increases the severity of the operation; (*b*) vesical papillomas can be dealt with satisfactorily per urethram (*c*) the fundamental precaution is to guard against implantation in the wound, this being more easily achieved when the section passes through the ureter than when it involves the bladder. A ureteric papilloma may be the primary growth but is more likely to be a seedling from above. In either event the proper treatment is ureteronephrectomy.

Papilloma of Renal Pelvis in Dye Workers.—As early as 1895 Rehn called attention to the fact that papillomatous disease of the bladder is more prevalent among dye workers than among members of the general population. Macalpine observed many examples of these vesical growths in dye workers in Manchester. The 2 patients reported in this paper first were hospitalized with papillomatous disease of the bladder, and later renal pelvic papillomas developed. In the second of these patients the papillomas were bilateral. Renal growths were discovered in 1 case four years and in the other over five years after the vesical neoplasm first became manifest. In each case, though excretion urograms had been obtained at the time of the original investigation and on at least one subsequent occasion, the neoplasm was regularly overlooked till it had grown to a large size, in spite of the fact that the bladders had been under periodic cystoscopic review. The preceding vesical disease had focused attention unduly on that organ. Subsequently it became routine practice to order excretion urograms at relatively short intervals for these papilloma-forming subjects. In the first patient the renal tumor must be regarded as an independent primary neoplasm. The author also regards the tumors of the second patient as three primary growths, and if this view is correct, it proves the strength of the stimulant to tumor formation. The literature records 6 other examples of pelvic papillomas in dye workers.

Autogenous Grafts for Repair of Nerves.—Seddon says that analysis of 1,861 cases of injury to nerves showed that 699 required operative repair. The standard method of repair is mobilization of the nerve stumps, resection back to healthy bundles centrally and peripherally, and end to end suture with the limb in a position that permits easy approximation. Unfortunately, recent experience has shown that if the gap closed is large, say 11 cm. in the case of the lateral popliteal nerve or 9 cm. in the case of the median, the postoperative stretching, however carefully carried out, damages the nerve to such an extent as to preclude useful recovery. End to end suture was carried out in 71 per cent of 699 cases, bulb suture in 0.4 per cent and suture with bone shortening in 0.4 per cent. There is no evidence that heterogenous and homogenous nerve grafts are of the slightest use; only autogenous nerve grafting offers any prospect of success. In 58 cases in which extensive gaps have been repaired by autogenous grafts 52 have been followed long enough to permit assessment. The operation was of value in 35 of 52 cases. Grafts may be taken from any cutaneous nerve, though only from the part in which branches are not given off. The most suitable are the medial cutaneous nerve of the forearm, where it lies in the arm; the sural proximal to the lateral malleolus; the superficial radial proximal to the wrist, and the saphenous in the thigh. Single strands are used for the repair of small nerves; two or four strands may be employed for bridging gaps in large nerves. When two main trunks have been extensively damaged, a segment from the less important may be used for the repair of the gap in the more important nerve. All grafts shrink, and the graft should therefore be about 15 per cent longer than the gap to be repaired. The diameter of the graft or collection of grafts must be at least equal to that of the peripheral stump of the nerve. A graft is revascularized from the nerve stumps but is also nourished from the bed in which it lies. Scar tissue should therefore be removed if possible. In lay grafting is the ideal treatment for partial division of a nerve. Main trunk grafts are sutured in the usual way to the stumps of the host nerve. Cutaneous grafts, whether used singly or in the form of a cable, are best attached with concentrated fibrinogen, which can be made to set rapidly into a firm clot.

Histologic Aspects of Nerve Repair.—Holmes took biopsies from two grafts, each formed of two parallel lengths of the lateral popliteal nerve and placed sixteen and twenty-two months previously in a gap in the medial popliteal nerve. In both cases the lateral popliteal nerve had itself been divided by the original injury. Three of the grafted lengths of nerve were taken from the distal stump and so were predegenerated; these were found to be satisfactorily reinnervated. One of the grafted pieces was taken from the proximal stump and was normal when transplanted; the biopsy from this nerve was necrotic, and there was no evidence of regeneration. In three cases nerves were experimentally transplanted and later examined histologically. One transplant was of a segment of the posterior interosseous nerve and was sutured to a normal proximal stump. It was found to be abundantly reinnervated and normal in all respects. Two segments of the radial nerve were treated as free transplants; they showed some abnormalities of degeneration, but none so severe as to prevent their serving as successful grafts. Full thickness autografts offer considerable prospects of success. Grafts taken from the distal stump of a divided nerve may be more successful than those from the proximal stump, since they are better able to survive the temporary ischemia of transplantation. Excessive collagenization of the endoneurium in the distal stumps of digital nerves is considered to be an important cause of failure in grafting operations in the hand.

*Histamine Level of Blood in Patients with Gastric or Duodenal Ulcer Before and After Treatment with Aluminum Hydroxide. A. C. M. Verschure and T. Strengers.—p. 274.

Predisposing Factors in Colibacillosis. E. Adlercreutz.—p. 282.

Histamine in Ulcer Patients.—Lips and his associates say that although there seems to be a relationship between gastrointestinal ulcers and histamine, some factors still require investigation. They found that of 60 patients in whom gastric or duodenal ulcer had been proved by roentgen examinations, only 10 patients showed an increased histamine level of the blood. There was no apparent correlation between the secretion of gastric acid and the histamine level of the blood. The histamine levels in patients with gastric ulcer were not different from those found in patients with duodenal ulcer. In 37 patients the histamine content of the blood was determined after treatment with diet and continuous administration of colloidal aluminum hydroxide. From these values a definite increase of the histamine became apparent, although a decrease was expected. It is questionable whether the increase is a direct result of the healing of the ulcer or is due to other factors. The authors suggest the following possibilities: 1. A change in p_H of the contents of the colon after administration of aluminum hydroxide may create an optimal medium for a histaminogenic intestinal flora and thus promote the resorption of histamine from the intestine. 2. Most of the patients become constipated by the diet and the long rest in bed. Resorption of histamine from the contents of the colon may therefore last longer and occur more easily. 3. The inflamed tissue around the ulcer, which is rich in histamine, is resorbed during the healing process.

*Preventive Inoculation Against Cholera. W. Silberstein.—p. 174.

Notes on Cholera Epidemic in Burma. E. Steinitz.—p. 175.

Preventive Inoculation Against Cholera.—Silberstein points out that there is no general invasion of the body or of the blood by the cholera vibrio. The micro-organism remains localized in the intestine, and symptoms are due to the action of the vibrio there and to the absorption of the toxin. The cholera vibrio is not brought into direct contact with the blood serum as in the case of typhoid, when the typhoid bacillus invades the blood. Some human beings seem to possess a degree of natural immunity to prevent infection. The acidity of gastric juice apparently suffices for the destruction of the vibrio and may explain the escape from infection in some instances. Vibrios have been found in the feces of carriers without clinical evidence of cholera. One attack of the disease generally confers immunity. In 1885 Ferran injected small doses of a living broth culture subcutaneously, but results were unsatisfactory. In 1892 Haffkine prepared two kinds of living vaccine; results were not sufficiently conclusive. The author thinks that the threat to other countries from the cholera epidemic in Egypt will increase as the epidemic ends there and carriers pass the reopened frontier. Important measures to be taken are protection of the drinking water against infection, continuous supervision of sanitary conditions and strict hygiene in the kitchen. Countrywide protective vaccination, on the other hand, is unnecessary or at any rate premature in view of its uncertain and shortlived effectiveness.

Pneumococcic Meningitis. H. Naussac and J. Durant.—p. 847.

*Treatment of Infectious Endocarditis with Regard to 14 Cases Treated with Large Doses of Penicillin: Immediate Results and After Several Months. B. Muller and G. Marandon.—p. 863.

Treatment of Infectious Endocarditis.—Muller and Marandon present observations on 14 patients with infectious endocarditis whom they treated with large doses of penicillin. Five had streptococcic endocarditis, 3 had staphylococcic endocarditis and in the other 6 the causal organism could not be identified. In 10 cases the immediate results were favorable, but in 4 cases the patients died. Treatment with large and sometimes enormous doses of penicillin constitutes a veritable revolution in the treatment of infectious endocarditis. In the great majority of cases it causes complete disappearance of the infectious process. To obtain these favorable results the treatment must be carried out in a hospital under careful medical supervision. The daily dose should be not less than 480,000 units and frequently as high as a million. The daily dose may, if necessary, be increased to 2, 3 or 4 million units or more. The treatment must be continued for more than a month. In order to check the late results and to detect relapses, the patient should be reexamined at definite intervals. The authors were able to ascertain the late results in 9 of their 10 surviving patients; in these the favorable results had persisted for more than four months, in some for more than a year. Since relapses usually occur during the first few months, the late results in the tenth patient cannot as yet be estimated because insufficient time has elapsed.

Tuberculosis of Young People Who Have Passed Legal Age for Attending School. H. Wissler and H. Meier.—p. 1350.

*Effect of Urethane on Normal Blood Picture in Man. S. Moeschlin and J. Meili.—p. 1351.

*Defense Function of Human Body Against Malaria. M. Lauterburg-Bonjour.—p. 1359.

Effect of Urethane on Normal Blood Picture.—Moeschlin and Meili studied the effect of urethane on the blood of 20 persons who were given 3 to 4 Gm. of the drug daily by mouth as a substitute for other sedatives for a period of one to two months. There was a slight increase in the number of lymphocytes in the first two or three days, followed by a pronounced drop in their number, reducing them in four weeks to from one third to one fifth of their former value. There was a successive increase in lymphocytes when urethane was discontinued. The drop in lymphocytes was in general more pronounced in persons whose initial values of lymphocytes were higher than in those with lower initial values. In certain hypersensitive persons the therapeutic dose of urethane used by the authors may cause a nearly complete disappearance of the lymphocytes associated with a pronounced deterioration of the general health, so that the drug must be discontinued, e. g. in Hodgkin's disease or in chronic myeloid leukemia. It is therefore advisable to watch the absolute number of lymphocytes in all patients treated with urethane for a prolonged period. In the majority of instances the effect of urethane on the granulocytes was less pronounced and evidently slower; the granulocytes usually increased in number in the first ten days, on the average by 1,500, and then there was a drop until in the third week their number was below the initial value; after eight weeks, on the average, the neutrophils were reduced by one fourth to one fifth of their initial value, and the same applied to eosinophils and monocytes, while there was no change in the number of the thrombocytes. An individual hypersensitiveness of the granulocytopoiesis toward urethane was observed in 1 case of postencephalitic parkinsonism in which the drop in granulocytes continued for twenty days after the drug was discontinued because of the great drop in lymphocytes. Except in 1 instance the erythrocytes and reticulocytes did not show a definite drop in number. Urethane affects principally the cells observed in chronic leukemias, which are probably degenerated neoplastic cells. It also affects the normal lymphocytes and to a limited extent the normal granulocytes. Urethane has an inhibitory effect on mitosis in all its stages.

Defense Function Against Malaria.—According to Lauterburg-Bonjour, immunity against malaria is of a complex nature. Various mechanisms participate in its production; normal phagocytosis as well as its stimulation by humoral factors, parasiticide and antitoxic substances have been demonstrated. The artificial immunity is not permanent; it is definitely specific not only for the species but even for the strain. In endemic areas man may be benefited by a latent malaria, being protected at least against a new infection with the same malarial strain. It is suggested that the increased incidence of malaria in certain populations which are migrating to other regions may depend on the fact that new strains may not be susceptible to the once developed immune bodies and consequently the plasmodia will have a chance to proliferate, thus causing recurrences of the disease. Intuitive knowledge and observations suggested that treatment with quinine should be instituted only after several attacks of fever. In the light of new research this does not seem to be advisable, since the immunizing forces are too transitory to be relied on.

Book Notices

Trichomonas Vaginalis and Trichomoniasis. By Ray E. Trussell, M.D., Associate in Hygiene and Preventive Medicine, State University of Iowa, Iowa City, Iowa. With an Introduction by E. D. Plass, M.D., Professor of Obstetrics and Gynecology, State University of Iowa. Cloth. Price, $6. Pp. 277, with 23 illustrations. Charles C Thomas, 301-327 E. Lawrence Ave., Springfield, Ill., 1947.

This book is based not only on the author's intensive studies of the subject but also on a review apparently of every paper written about Trichomonas vaginalis and trichomoniasis. In the bibliography there are 1,586 references. The book is divided into three parts. The first deals with T. vaginalis, its morphology, growth requirements, preservation in cultures, chemistry, pathogenicity, identity of species and other characteristics. The second part considers infections due to T. vaginalis, their sites and incidence, source, incubation period, prognosis, pathology, laboratory diagnosis, clinical findings, immunity, relation to puerperal morbidity and abortion and other characteristics. The third section is concerned with treatment.

The author points out that, in spite of a common belief, the three trichomonads which commonly parasitize the human organism are morphologically and culturally distinct, and each one is adapted to its own environment in the mouth, intestine or genitourinary tract. Likewise, the common animal trichomonads are not related to those causing human infections.

Failure to cure trichomoniasis does not depend on an encysted stage, for the existence of which there is no convincing evidence, but on four factors: (1) rectal, urethral and glandular involvement were overlooked; (2) treatment was inadequate or inappropriate; (3) reinfection occurred, or (4) a drug resistant strain developed. The author emphasizes that the final work in the therapy of infections due to T. vaginalis is far from having been written. Much experimental work remains to be done. Ultimately, it is hoped that a compound will be discovered which can be given orally and be effective in eradicating the parasite.

This book is well written, it is authoritative, and it gives an unbiased analysis of every type of treatment advocated for the eradication of trichomoniasis. It has only a few illustrations, but they are clear and instructive. The type used makes reading easy. The book should be read by every one interested in T. vaginalis and trichomoniasis.

Diagnostik der Kinderkrankheiten mit besonderer Berücksichtigung des Säuglings: Eine Wegleitung für praktische Ärzte und Studierende. Von Professor Dr. E. Feer. Fifth edition. Paper. Price, $7.80; 33.60 Swiss francs. Pp. 428, with 285 illustrations. Springer-Verlag OHG, Mölkerbastei 5, Wien I, 1947.

The fifth edition of this popular book is characterized mainly by the clinical point of view for which Feer is so well known. It is not a book on differential diagnosis, as the title may lead one to think, but rather a book on the aids in diagnosis, mainly by means of physical examination. In these days of complicated laboratory examinations it is refreshing to find a book that stresses inspection, palpation and auscultation. The laboratory examinations discussed are limited to routine urinalysis and blood tests, which can be done by the clinician in his office. Technic is not described. Only interpretations are discussed. The author points out symptoms and signs in various diseases and compares the normal with the pathologic. Much space is devoted to symptoms and signs during early infancy, with special reference to digestive disturbances. In this section the author deviates from his plan of the rest of the book and discusses diseases as entities. In his classification of digestive disturbances he follows, in the main, the nomenclature of Finkelstein, such as atrophy and decomposition. He also retains the terms Milchnährschaden and Mehlnärschaden of Czerny-Keller, terminology that is no more used by American pediatricians.

The new edition contains discussions on metabolism, endocrines and vitamin deficiency which were not included in the previous editions. Unfortunately these discussions are inadequate and could have been left out.

Feer's disease (acrodynia) receives a good deal of attention, more so than other infrequent diseases. This, however, is easy to understand and is excusable. The book, which is profusely illustrated, is a useful guide to clinical pediatrics. The most valuable lesson one carries away from it is the importance of observation in clinical medicine.

Synopsis of Obstetrics. By Jennings C. Litzenberg, B.Sc., M.D., F.A.C.S. Third edition. Fabrikoid. Price, $5.50. Pp. 416, with 157 illustrations. The C. V. Mosby Co., 3207 Washington Blvd., St. Louis 3, 1947.

Few changes have been made in this edition. Practically all of the hundred and fifty-seven illustrations have been borrowed from other textbooks just as they were in the first two editions. Several chapters have been rewritten, but there are a few omissions. In the treatment of gonorrhea and syphilis penicillin is not mentioned. Nothing is said of the relationship of rubella in the mother during the first three months of pregnancy to fetal deformities. The author had Dr. R. W. Koucky write a section on the Rh factor in pregnancy, but he himself failed to associate the Rh factor with erythroblastosis. In fact he uses the term erythroblastosis as a synonym for "Edema of the Fetus" (Page 263) and for "General Dropsy" (Page 285), and he does not even mention the Rh factor in the short section on erythroblastosis. In the treatment of placenta previa the author still advocates Braxton Hicks version as one of the procedures, even though this way of treating placenta previa has been used less and less and has been condemned by several obstetric authorities. The use of a Willett or other forceps for traction on the baby's scalp is not mentioned. In the discussions of the various types of uterine hemorrhage blood transfusion is recommended, but nowhere is there a warning about the determination of the Rh factor before blood is transfused into a parturient woman.

In spite of the fact that this book is not up to the minute, it nevertheless contains the essential knowledge of obstetric practices and therefore is helpful.

A Hand-Book of Ocular Therapeutics. By the late Sanford R. Gifford, M.D., F.A.C.S. Revised by Derrick Vail, M.D., D.O., F.A.C.S., Professor of Ophthalmology, Northwestern University Medical School, Chicago. Fourth edition. Fabrikoid. Price $5. Pp. 336, with 66 illustrations. Lea & Febiger, Washington Square, Philadelphia 6, 1947.

This well known book has been revised by Dr. Vail to bring it up to date. The chapter on muscles has been omitted but was not in order in a book on therapeutics. Dr. F. C. Cordes has revised the chapters on specific and nonspecific protein therapy and physical therapy and treatment of optic nerve disease, and Dr. John Bellows has brought up to date the parts on sulfonamide and antibiotic therapy. The book is a handy reference volume on ocular therapeutics and should continue to be popular with practicing ophthalmologists.

Communal Sick-Care in the German Ghetto. By Jacob R. Marcus, Ph.D., Adolph S. Ochs Professor of Jewish History, Hebrew Union College, Cincinnati. The Ella H. Philipson Memorial Publications, Volume I. Cloth. Price, $4. Pp. 335. The Hebrew Union College Press, 34 W. Sixth St., Cincinnati 2, 1947.

This book deals with the sick among Jews through the Middle Ages. Although according to the title the subject is limited to sick care in the German ghetto, the book covers much more territory, extending to the health care of Jews not only in Germany but in the Roman Empire. The greater part of the book discusses the care of the sick among the Jews from the sixteenth to the nineteenth century. Several chapters are devoted to a description of the function of the Hebra Kadisha (The Holy Brotherhood), which made the care of the sick its special province. This care included not only medical and financial aid for the living but burial and ritual services for the dead when the illness terminated fatally. There are several interesting and informative chapters on Jewish hospitals, their number and character in both medieval and modern times.

Throughout the volume, there are historical references to folk medicine and to the care of the insane. Of particular interest is the material dealing with the role Jewish women played in the care of the sick. The book should serve as an excellent reference for anyone interested in the history of health care of the sick during the Middle Ages.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

X-RAY AND RADIUM FOR THE NASOPHARYNX

To the Editor:—Granting that radium treatment is the choice for lymphoid hyperplasia around the mouth of the eustachian tube, is it also indicated for other nasopharyngeal pathologic conditions, such as adenoid regrowths, lymphoid hyperplasia and chronic inflammations of the nasopharynx?

M.D., Arizona.

ANSWER.—Roentgenologists prefer roentgen therapy to radium therapy in diffuse lymphoid tissue in the nasopharynx as in adenoid regrowths and lymphoid hyperplasia. Sometimes combinations of radium and roentgen radiation are used in benign tumors in the nasopharynx. The nasopharynx has been considered the most important location for a primary focus of infection in the upper air passages. This is attributable to the rich content of lymphoid tissue in its mucous membrane. Chronic inflammation of the nasopharynx may be perpetuated by sinusitis, catarrhal or suppurative, of the posterior ethmoids or sphenoids or both.

In cases of chronic inflammation of the nasopharynx (excluding proved lymphoid hyperplasia and infection) investigation of the nose, sinuses, teeth, gingiva and fauces should be undertaken. Infection which is encountered should be thoroughly treated.

DIFFICULTY AFTER THYROIDECTOMY

To the Editor:—A patient had a thyroidectomy nineteen years ago. Since that time there has been a general tightening of the tissues at the site of operation. At present, there is a strong pull in several directions. When the patient speaks or swallows she has an uncomfortable feeling of constriction. She has been treated with negative galvanism, thiosinamine and iodides. All tests are negative. Her surgeon refuses to reoperate to relieve adhesions. I have been the family physician, and at present the responsibility is mine. What more can be done to relieve this tension?

Mary L. Rosenstiel, M.D., Freeport, Ill.

ANSWER.—Development of cancer in the remnant of thyroid tissue must be ruled out. Parathyroid tetany may be diagnosed by determination of an abnormal serum calcium level. If neither condition is present and the patient does not have difficulty in breathing, a sense of "tightening" may be disregarded. In most instances a sensation of tightening in the throat is associated with a functional nervous disturbance. Possible psychogenic factors in the patient's difficulty should therefore be explored.

CATAPLEXY

To the Editor:—A white woman, aged 27, began to have periods of excessive weakness during periods of laughter about one year ago. These have become more numerous and disabling. The spells cause complete relaxation of muscles, with the result that she drops dishes, glasses and on one occasion her child aged 8 months. What is the physiologic or pathologic diagnosis and can specific treatment be recommended?

M.D., Pennsylvania.

ANSWER.—The case described is a typical example of what is known as cataplexy. It is an organic condition due to a structural lesion in the corpora striata which frequently follows an attack of epidemic encephalitis. The original attack is often passed off as "influenza." It is allied with catalepsy, which often occurs in the same person. As the cause is structural, it is not easy to abolish the disease. Many of these persons are considered hysteric and are subjected to suggestion and psychoanalysis to little purpose. Often administration of racemic amphetamine sulfate ("benzedrine sulfate"), 5 mg. one, two or three times a day, will abolish attacks; however, it may be necessary to offset insomnia due to this treatment by giving pentobarbital sodium at night.

ATABRINE AND DEAFNESS

To the Editor:—What information is available on the relationship between "atabrine" and deafness.

David Bernstein, M.D., Brooklyn.

ANSWER.—Conversation with physicians who have used quinacrine ("atabrine") extensively, and reference textbooks give the impression that this drug does not injure the ear. This is different from what happens when quinine is used. In those instances in which quinine and quinacrine are used together it is reasonable to assume that the quinine caused the injury.

CHLORINE AND LYMPHOBLASTOMA

To the Editor:—A man aged 53 has generalized lymphadenopathy. Biopsy of an axillary node was studied and classified as a form of lymphoblastoma. Roentgen and supportative therapy have been utilized since June 1947. For a period of eleven years he had been exposed daily to varying concentrations of chlorine in a room where a chlorinator was in operation. His wife states that he had on numerous occasions suffered episodes of coughing, gasping for air and an abortive shock-like syndrome. An automobile parked outside of the work-room was noted to have some parts pitted. Pitting, after examination, was reported to be "due to chlorine." His family questions the possible relation of his disease to the eleven year exposure to chlorine. I have no adequate answer. What is the correct opinion?

William L. Bennett, M.D., Huntington, N. Y.

ANSWER.—The term chlorolymphoblastoma appears in medical literature and on occasion has given rise to the erroneous belief that chlorine may have been the etiologic agent. Instead, this term derives from the fact that in the condition mentioned certain tissues assume a greenish color. In no known instance has chlorine been accepted as the cause, and usually the condition arises in the absence of exposure to the element. The term lymphoblastoma does not refer to a pathologic entity but instead, in omnibus fashion, embraces a variety of somewhat similar conditions, some of known malignancy and others of apparent nonmalignancy. By some the leukemias are included in the general category, lymphoblastoma. It does not appear that exposure to chlorine contributed to the causation in this instance. In Hueper's "Occupational Tumors and Allied Diseases" (Charles C Thomas, Springfield, 1942) mention is not made of lymphoblastoma, although chlorine is cited as a result of work of others as possibly related to pulmonary neoplastic disease. Gilchrist and Matz encountered no evidence that the war gases, including chlorine, or any nonspecific chemical trauma might be incriminated in the development of any of the leukemias. No residual evidence of chronic myeloid or lymphoid leukemia was recorded among the 70,752 United States soldiers alleged to have undergone gas poisoning in World War I. With respect to pulmonary malignancy, uncertain data suggest that war gases, including chlorine, may have contributed to the causation of pulmonary cancer. Under experimental conditions several hundred dogs have been exposed for periods in excess of one year to high concentrations of chlorine without any significant permanent injury to the pulmonary tract. Nonetheless, epithelial metaplasias of bronchial mucosa have been reported by Ricker and Adelheim in animals exposed to chlorine gas. In the present instance no warrant exists for attributing the lymphoblastoma to chlorine. Chlorine is a highly active primary irritant, but before it reaches the blood stream it has been altered to harmless sodium chloride.

ACUTE COLLAPSE FOLLOWING SPINAL ANESTHESIA

To the Editor:—What are the references to literature regarding cerebral cortical changes that may take place with drop in blood pressure following spinal anesthesia with subsequent acute collapse and cardiac and respiratory failure? The patient recovers after a few minutes; begins to breathe and to have normal heart beat and blood pressure.

Is there evidence indicating that such persons through deprivation of oxygen to cortical cells will subsequently lead a vegetative existence without normal consciousness?

Milton T. MacDonald, M.D., New Bedford, Mass.

ANSWER.—Reference has been made many times in the literature to damage to the brain which followed use of various kinds of anesthetics and which resulted from a variety of conditions during anesthesia. C. B. Courville (Asphyxia as a Consequence of Nitrous Oxide Anesthesia, *Medicine* **15**:129-245 [May] 1936) has called attention to the damage to the brain which may follow the use of nitrous oxide and oxygen, and similar experiences have been reported in regard to the use of other anesthetics, including "pentothal sodium" and ether. It naturally follows that similar damage could occur as a result of collapse during spinal anesthesia. Some of the more recent references are to work by: Leonid Walter (Observations on Spinal Analgesia, *Current Researches in Anesth. & Analg.* **20**:132-144 [May-June] 1941); Stanton Belinkoff (Coma During and Following Spinal Anesthesia, *Ann. Surg.* **122**:278-286 [Aug.] 1945); E. M. Hammes (Neurological Complications Associated with Spinal Anesthesia [Eight Cases], *Minnesota Med.* **26**:339-345 [April] 1945); Rolf Lium (Cardiac Arrest After Spinal Anesthesia: Report of a Case with Recovery, *New England J. Med.* **234**:691-692 [May 23] 1946), and A. B. Noble (Cerebral Anoxia Complicating Spinal Anaesthesia, *Canad. M. A. J.* **54**:378-379 [April] 1946).

A variety of results have been observed. In some cases the patient never regains consciousness and dies ten to twenty hours after resumption of breathing and after the return of pulse rate and blood pressure to satisfactory levels. Also, partial recovery, as well as full recovery, may occur.

NUTRITIONAL REQUIREMENTS DURING PREGNANCY AND LACTATION

BERTHA S. BURKE, M.A.
and
HAROLD C. STUART, M.D.
Boston

The normal physiologic processes of the body are greatly altered during pregnancy and lactation, and additional demands are imposed on the maternal organism during each period. Digestion and absorption from the intestinal tract are frequently impaired, especially during the early months of pregnancy, and nutritional requirements are considerably elevated during the latter half of pregnancy and during lactation. It is not strange, therefore, that evidences of nutritional deficiencies are more likely to appear at these times, and it is obvious that the diets of pregnant and lactating women deserve special consideration. Since considerable evidence has accumulated in recent years which indicates that faulty nutrition during pregnancy may affect the pregnant woman or her fetus in ways not usually considered to be signs of malnutrition, some of the studies from which this evidence has come will be reviewed. They provide a background for understanding the special requirements of this period and the bases for the nutritional allowances usually recommended. They also indicate the importance of including evaluation of nutritional status and dietary advice as a routine part of prenatal care.

Since the purpose of this article is to summarize our present understanding of nutrition as it relates to pregnancy and lactation, no attempt will be made to review the literature completely. Garry and Stiven[1] have reviewed the earlier literature from the standpoints of human research and animal experimentation; Garry and Wood[2] have discussed developments in the human field during the last ten years; Burke[3] has emphasized the major developments especially in human research, and Warkany[4] has summarized the manifestations of prenatal nutritional deficiency demonstrated by animal experimentation.

RECENT HUMAN STUDIES INDICATING THAT NUTRITION IS AN IMPORTANT FACTOR IN PREGNANCY

A number of antepartum studies on relatively large numbers of women, which have included careful evaluations of their diets during pregnancy or have provided supplements to their customary diets, have demonstrated a surprisingly strong relationship between the character of the maternal diet on the one hand and the course or outcome of pregnancy and the development of the fetus on the other. The earliest report of this type to attract attention was based on a study in Toronto, Canada, by Ebbs, Tisdall and Scott.[5] Three groups of women were studied during the last half of pregnancy. The diets of the women in one group were supplemented to an excellent nutritional level; another group of women was taught an excellent diet for pregnancy, while the third group remained on poor diets and so served as controls. The incidences of abortions, premature births, stillbirths and neonatal deaths were significantly higher in the group on a poor diet. Not only did the women in the groups with supplemented and good diets have healthier babies, but they themselves proved to be better obstetric risks; they suffered fewer complications, including less toxemia, and they had fewer difficulties during labor, delivery and the postpartum period. The ability of the mother to nurse her infant also appeared to be influenced by the quality of her diet during pregnancy.[6]

A committee of the People's League of Health of England investigated the influence of nutrition of expectant and nursing mothers on maternal and infant morbidity and mortality. Supplementary minerals and vitamins were given to 50 per cent of about 5,000 English women, the remainder serving as controls. The reports of this committee[7] indicate that the incidence of toxemia was 30 per cent lower in the group on a supplemented diet than in the control group. The committee claimed that "a diagnosis of toxaemia cannot be based upon hypertension by itself, as this frequently connotes . . . an essential hypertension," and that the diagnosis of toxemia on the basis of albuminuria, edema, etc., with or without hypertension, but generally with hypertension, has "the advantage of segregating for special study those cases in which the diagnosis of toxaemia rests on a reasonably secure foundation." On this basis the primiparas who received the supplements were found to be protected against toxemia to a sig-

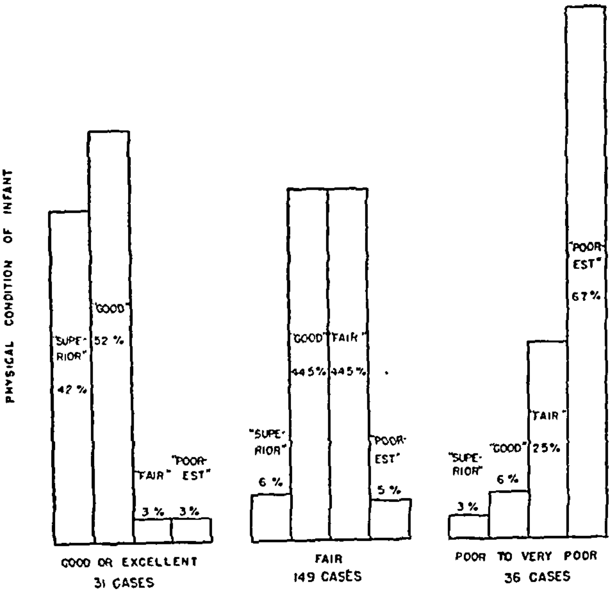
nificant degree, but the results were favorable in the multiparas to a lesser degree. The incidence of prematurity on the basis of weeks of pregnancy was decidedly reduced in the supplemented diet group. The committee emphasized the importance of this finding, since in England about 50 per cent of the infant deaths under 1 month of age are due to prematurity.

Another study carried out by the National Birthday Trust Fund and reported by Balfour[8] included nearly 20,000 women chosen from the lowest income groups in England and Wales. One group of women was fed a yeast supplement, while another group was furnished supplements of vitamins A and D as well as calcium, phosphorus and iron. All the groups received additional milk, so that the chief dietary differences between the groups were in the concentrates fed. Differences in age, parity and social and economic conditions were in favor of the control group. Hence, it can be fairly assumed that any favorable results in the experimental group were due to improvements in diet. Statistically, significant reductions in the stillbirth and neonatal mortality rates were observed, particularly in the group fed the vitamin B supplement. The maternal deaths were extremely few despite the large number of cases. There was a slight but not significant reduction in the incidence of toxemia in the supplemented diet groups.

Burke, Beal, Kirkwood and Stuart[9] studied a group of women drawn from the prenatal clinics of the Boston Lying-in Hospital. Detailed nutrition histories were obtained at intervals during pregnancy. An over-all relationship was found to exist between a good or excellent diet during pregnancy and good physical condition of the infant at birth. This relationship is shown in the chart.



Relationship of prenatal nutrition to the physical condition of the infant at birth and within first two weeks of life (from Burke, Beal, Kirkwood and Stuart[9b])

In the 216 cases studied, all the stillborn infants, all except 1 of the infants who died in the neonatal period, all except 1 of the premature infants, most of the infants with major congenital defects and all the infants considered to be "functionally immature" were born to women in the poorest diet group. In contrast, 94 per cent of the infants born to mothers on good or excellent diets during pregnancy were in good or excellent physical condition at birth. A significant relationship was found to exist between the antepartum diet and the course of pregnancy, although this relationship was less pronounced than that with the condition of the infant at birth. The relationship between the general dietary rating during pregnancy and the incidence of toxemia was also significant. No statistically significant relationship for primiparous women was found between the antepartum diet and the length of labor. However, there were many more difficult types of delivery in the poorest diet group, despite the fact that these infants at birth averaged almost 3 pounds (1,363 Gm.) lighter in weight and several centimeters shorter in length than the infants of mothers whose diets were good or excellent.

Cameron and Graham,[10] working at the Glasgow Royal Maternity and Women's Hospital, studied the food intakes of mothers of stillborn infants, mothers of prematurely born infants and an equal number of mothers of normal full term infants. The average dietary intakes of the mothers with full term infants were superior in all respects; the superiority was greatest in protein, calcium and phosphorus. Apparently the vitamin content of these diets was not evaluated. These workers tested the validity of their observations in a practical way. Several hundred women attending the prenatal clinics of the hospital had their diets carefully supervised during the late months of pregnancy and an equal number whose diets were unsupervised served as controls. The average age and parity of the two groups were not significantly different. The incidences of stillbirths and premature births were significantly higher in the groups with unsupervised diets. Although there were more neonatal deaths in the control group, the difference in this respect was not significant.

Under the severe restrictions imposed by war, England appears to have profited considerably with respect to health as a result of her need to utilize all available food as efficiently as possible. Although the diet has been extremely monotonous, the average nutritional quality of the English diet has improved. This has been especially true for the poorer classes to whom are born the major proportion of the infant population. Previous to the war the diet of the pregnant woman in the lower income brackets in England[11] was poorer than that of the average adult, but during the war special attention was focused on her diet. For the first time in the history of England special food was made available to all pregnant women in the form of additional milk, eggs, supplementary vitamins and other extra rations when possible. The Ministry of Health and the Ministry of Food instituted widespread propaganda programs for the use of these extra rations. A study of the stillbirth rates in England and Wales[12] from

[12] Sutherland, I.: The Stillbirth-Rate in England and Wales in Relation to Social Influences, Lancet **2**: 953-956 (Dec. 28) 1946.

1928 through 1944 showed that a sharp drop occurred in all counties after this rationing program was instituted. In the poorest economic districts the drop has been highest; in Wales, for example, it amounted to approximately 35 per cent. The neonatal death rate has apparently declined similarly but to a less degree. These changes occurred at a time when all conditions of life other than nutrition had deteriorated.

Baird[13] in Scotland has shown that among the women in the lower socioeconomic groups the incidence of prematurity was twice, the stillbirth rate three times, and the neonatal mortality rate four times the comparable rates found in the women of the upper economic groups. Baird discussed the fact that the stillbirth and neonatal death rates appear to be controlled by social conditions which operate through the mother. He emphasized the fact that in England, Wales and Scotland the stillbirth rate has fallen during the war period and that all age groups and parities have been affected uniformly. He referred to the apparent operation of some factor on a national scale and he considered it probable that improvement in the diets of the poorer women is the explanation.

Severe famine conditions due to war, such as those which existed in Holland for a number of months during the winter of 1944 and spring of 1945 and in Leningrad during the siege of that city, have contributed also to knowledge of the effect of impaired nutrition during pregnancy on mother and fetus. Smith,[14] working in Holland, found that about 50 per cent of the women suffered from amenorrhea and were presumably infertile during the hunger months and that this disappeared promptly with the return of food. The birth rate fell sufficiently to reduce the number of births nine months later to about one third of the usual number. The birth weights of infants born at full term decreased abruptly during the hunger months, and rose almost as abruptly as Holland emerged from this severe starvation period. A significant decline in birth length was also noted, but was less pronounced than the change in weight. Other effects presented by Smith were given with caution as to their statistical reliability because of Holland's abnormal conditions. The available data in regard to abortions were considered useless. There appeared to be only a slight increase in premature births, while the frequency of stillbirths and neonatal deaths in hospitals was not increased. A slight but not significant increase in congenital malformations did occur. The sharp fall in the conception rate associated with amenorrhea may have so altered the situation as Antonov[15] suggested, as to have allowed only those women to become pregnant whose nutritional state was better than most or who for one reason or another received additional food. As a result of studies carried out in Leningrad, Antonov found that in the first half of the period of the siege the stillbirth rate rose to 5.6 per cent or twice the normal figure, the rate of premature births rose to the unusually high figure of 41.2 per cent and the neonatal death rate to 21.2 per cent. The total number of births in this period in the Leningrad State Pediatric Institute was 414. Within the next six month period the prevalence of amenorrhea was widespread, and, owing to a further sharp drop in the birth rate in Leningrad, only 79 women entered the institute for delivery. Among these the rates for prematurity, stillbirths and neonatal deaths were within normal limits. It was shown that for various reasons the majority of these women had considerably better food than was usual at that time.

Toverud[16] reported a study of approximately 1,000 pregnant women in a special health district of Oslo who, as a part of prenatal care, were given nutritional guidance during pregnancy. Her results indicate clearly a relationship between the maternal diet, the mother's health and course of pregnancy, as well as benefits to the newborn infant. The stillbirth rate in the supervised group for the years 1939 to 1944 averaged 16 per thousand live births compared to 30 per thousand for the city of Oslo, and the neonatal death rate was 11 per thousand compared to 20.

RESULTS OF MATERNAL DIETARY DEFICIENCY DURING PREGNANCY IN EXPERIMENTAL ANIMALS

In the literature dealing with animal experimentation there are many illustrations of fetal damage resulting from maternal dietary deficiency. The recent work of Warkany[17] and his associates in relation to congenital malformations is extremely important. He stated that:

> Genetics, infectious and actinic factors have been proved to be etiologic principles leading to malformations in mammals, including man. It has been suspected many times that malnutrition of the embryo can also be an etiologic factor;

Warkany has shown that in the maternal diet of the rat the presence or absence of sufficient riboflavin between the thirteenth and the fifteenth day of gestation is a decisive factor in the normal development of the skeleton of the embryo. Riboflavin is known to be essential for normal growth in that it is essential to cell respiration, and it would appear to be necessary also for normal embryonic differentiation. When the maternal diet of the experimental animal is made deficient in vitamin D, Warkany[18] has shown that malformations of an entirely different type result. More recently these same workers have demonstrated the development of certain congenital defects of the eye together with certain tissue defects in rats when the maternal diet is deficient in vitamin A.[19]

Warkany[20] offered the following explanation of the maternal-fetal relation in which congenital malformations may result:

> The stores of the maternal tissues act as "buffers" which prevent deprivation of the developing embryo as long as possible. In fact, it was assumed until recently that these maternal stores either protect the offspring completely, thus resulting in the delivery of normal young, or that in the case of extreme dietary deficiency the embryos die in utero. Although there is some truth in this "all or none" theory, it is not entirely correct. Between these two there exists a narrow range in which maternal nutritional deficiency may result in arrest of the embryos' development without causing death. In this case congenitally deformed offspring may be the result.

No one thus far has proved a relation between congenital malformations in man and maternal nutritional deficiency.

RECOMMENDED NUTRITIONAL ALLOWANCES FOR PREGNANCY

With such strong evidence that good diet during pregnancy lessens the likelihood of complications and contributes to a safer labor and delivery, there would seem to be ample reason for intensive efforts on the part of obstetricians and general practitioners to improve the diets of all pregnant women coming to them for prenatal care. The added evidence that women who have excellent or good diets during pregnancy are much more likely to have healthy well developed infants, and much less likely to have stillborn or prematurely born infants or infants who die in the neonatal period, increases the incentive to improve maternal dietaries.

The nutritional allowances for pregnancy (fourth through ninth months) as recommended by the Food and Nutrition Board of the National Research Council [21] are given in table 1, as well as the daily allowances recommended for the normal woman (sedentary) and for the lactating woman.

Recommended Daily Nutritional Allowances, Normal Woman, Pregnancy and Lactation
(Food and Nutrition Board, National Research Council [21])

Nutritional Essentials	Normal	Pregnancy (4th Through 9th Month)	Lactation
Calories *	2,100	2,500	3,000
Protein (Gm.)	60	85	100
Calcium (Gm.)	0.8	1.5	2.0
Iron (mg.)	12	15	15
Vitamin A, I. U.†	5,000	6,000	8,000
Ascorbic acid (mg.)	70	100	150
Thiamine (mg.)	1.1	1.8	2.0
Riboflavin (mg.)	1.5	2.5	3.0
Nicotinic acid (mg.)	11	18	20
Vitamin D, I. U.	...	400-800	400-800

* Energy requirements vary with activity, size of the person, etc.

† The requirement for vitamin A may be less if it is provided as vitamin A and may be more if chiefly in the form of carotene.

While many persons consider these allowances to be liberal, it should be remembered that they were designed to serve as guides and that they include a margin of safety over the minimum requirement for each nutrient (i. e., the amount which will just prevent clinical signs and symptoms of deficiency). In advising women in regard to their diets during pregnancy, our aim should be to assure that enough of each nutrient is included in the food actually eaten to provide for the best possible health during pregnancy and in preparation for labor, delivery and the postpartum period, as well as to provide an environment which will permit the optimum growth and development of the fetus. These allowances presuppose that women enter pregnancy in optimum nutritional condition, a supposition which is often far from true. Although the increased requirements up to the fourth month are so small as to be negligible, if the diet has not been good previous to pregnancy it should be improved as soon as pregnancy is recognized. Ideally, women should be taught as a part of their general education that it is important to enter pregnancy in excellent nutritional state. If Warkany's findings in relation to congenital malformations in animals are even in part applicable to man, correcting the diet of the pregnant woman after the first three months would not be effective in preventing congenital malformations if deficient diet is a factor. It is probably true that a woman's long time food habits prior to pregnancy, her diet early in pregnancy and her diet during the latter part of pregnancy all have important, although possibly different, effects on both the mother and fetus. To change a woman's food habits to any extent is a difficult task; she must be motivated to do so, and the woman who is found to have poor food habits in pregnancy has probably had the same habits for a long time; in fact, her food habits often represent long time family dietary patterns.

CALORIES AND WEIGHT GAIN DURING PREGNANCY

The energy requirement is given by the National Research Council as 2,500 calories, an increase of approximately 20 per cent above the normal requirement under sedentary conditions. However, the caloric requirement varies widely with activity. The important consideration is that the diet during pregnancy is a much more special diet than is often appreciated because as pregnancy advances the requirements for protein, minerals and vitamins are increased in some instances approximately 100 per cent (table 1), while at no time is the caloric requirement more than about 20 per cent above the woman's normal energy needs. Because it takes approximately 2,000 calories of carefully selected food to carry these structural and regulatory requirements, the freedom of choice is narrowed considerably during pregnancy in comparison to the normal diet, in which only about 1,200 calories are needed to carry the protein, minerals and vitamins.

The increased energy requirement during pregnancy is due to increased basal metabolic rate from the fourth month to term. According to Root and Root,[22] the basal metabolic rate is elevated 23 per cent at term. The increase has been shown by Carpenter and Murlin [23] to be due largely to fetal tissue, which has a higher specific metabolism per unit of weight than maternal tissue. They found that the basal metabolic rate of the woman just before delivery was equal to the rates of the mother and infant taken separately a few days after delivery. More recent work by Rowe and Boyd [24] and Johnston, Hunscher, Macy and others [25] indicates that it is elevated about 15 to 20 per cent above normal and that its elevation may also be subject to hormonal changes occurring in pregnancy. Sontag, Reynolds and Torbet [26] claimed that some women have an increase in basal rate of 30 per cent or more during gestation while others show an actual decline in rate.

The pregnant woman should be allowed to gain 20 to 25 pounds (9.1 to 11.4 Kg.) above her ideal normal weight for height, age and build. This implies that the underweight woman should be allowed to gain more and the overweight woman should be carefully controlled by restricting calories only while the structural requirements are fully met. Kerr [27] reported an average gain of 22.9 pounds (10.4 Kg.) in a case study of 500 normal primiparas. He found that increasing weight gains in pregnancy are associated with increasing weights of infants at birth, but that the latter increase has no influence on the duration of labor. Unpublished data by Burke indicate that if an underweight woman gains as much as or more during pregnancy than a normal or overweight woman, she tends to give birth to a smaller infant, her own body showing a net gain at the expense of her fetus. Conversely, if an overweight woman restricts her calories sufficiently, she experiences a net loss in weight herself, but her infant tends to be heavier than average. Here again is evidence that the fetus is parasitic on the mother to a degree, depending on the mother's nutritional condition when she enters pregnancy as well as on the quality and quantity of her diet during pregnancy.

PROTEIN

The protein allowance recommended by the Food and Nutrition Board of the National Research Council for the latter half of pregnancy is 85 Gm. daily or approximately 1.5 Gm. per kilogram of body weight. This represents an increase of 40 to 50 per cent above normal. Whatever the exact requirement may be, there is no doubt that the amount of protein needed for pregnancy is increased considerably over the normal. Nitrogen balance studies by several workers[28] have shown that women store normally relatively large amounts of protein during pregnancy over and above that needed by the fetus and the accessory structures. These metabolism studies indicate that a protein requirement of 845 to 900 Gm. (135 to 145 Gm. of nitrogen) above maintenance is representative of the total net requirement for the fetus and its adnexa during gestation and that under favorable circumstances a woman retains an additional storage of 1,250 to 2,500 Gm. of protein (200 to 400 Gm. of nitrogen). These figures represent an increased requirement of 10 to 20 Gm. of protein daily during the latter months of pregnancy.

A negative nitrogen balance sets in abruptly just before term,[29] and there is a substantial loss of nitrogen from the maternal organism during parturition and the postpartum period. For women who nurse their infants there is an additional loss in the breast milk amounting to 1 to 1.5 Gm. of nitrogen daily, depending on the amount of milk secreted. Thus, it is usual to find a negative nitrogen balance throughout the puerperium and often during the lactation period as well. The storage of nitrogen during pregnancy may, therefore, be regarded in part as a natural mechanism to provide in advance for the large losses occurring during delivery and the puerperium and in part as preparation for the high requirements of lactation.

In addition to the nitrogen balance studies already discussed, the recent studies of Burke and others[9c] indicate that less than 75 Gm. of protein daily during the latter part of pregnancy results in an infant who tends to be short, light in weight and likely to receive a low pediatric rating in other respects.

If it is assumed that an allowance of 60 Gm. (approximately 1 Gm. per kilogram of body weight) is desirable for the average nonpregnant woman and that an increase of 15 to 20 Gm. daily is needed in the latter part of pregnancy, the protein allowance of 85 Gm. daily suggested by the Food and Nutrition Board of the National Research Council appears liberal and adequate to care for individual differences. Williams[30] emphasized the important point that this figure presupposes a previously normal protein intake and nutritional state.

The question arises how nearly the diets of pregnant women approximate this allowance. Burke and others[9c] in studies at the Boston Lying-in Hospital found that only 10 per cent of the women were consuming 85 Gm. of protein daily, while 68 per cent consumed less than 70 Gm., 38 per cent less than 55 Gm. and 14 per cent less than 45 Gm. of protein daily during this important period of fetal growth and development. Arnell and others[31] found that among pregnant women in New Orleans 18 per cent took less than 42.5 Gm. of protein daily, i. e., less than half the recommended allowance, and 79 per cent took less than 70 Gm. daily. Williams and Fralin[32] in Philadelphia showed that only 13 per cent were taking the recommended daily allowance. It should be emphasized that an amazingly large number of women do not eat a diet well supplied with protein even for their normal needs and do not change their habits appreciably during pregnancy. Careful instruction in regard to the protein foods needed during pregnancy is therefore essential. The pregnant woman needs to be taught the importance of 1 quart of milk (about 1,000 cc.) daily (for its 32 Gm. of protein), at least ¼ pound (113 Gm.) of lean meat or its equivalent (for its 24 Gm. of protein) and an egg or equivalent daily (for another 6 Gm.). These animal foods or their equivalents will furnish approximately 65 Gm. of protein of high biologic value. A potato together with at least four servings of bread and cereal foods and the other necessary foods in a well balanced diet will furnish about 20 to 25 Gm. more protein in the day's diet.

Amenorrhea, noted by Smith in Holland and Antonov in Leningrad as a result of recent war conditions and already mentioned, also has been described by Sydenham[33] among British civilians in Stanley Camp, Hong Kong, China. Sydenham concluded that although emotional shock or change of environment may have explained many of the irregularities of menstruation and cases of amenorrhea of short duration, the 53.7 per cent of women with amenorrhea lasting more than three months—in some cases lasting a year or more—could hardly be explained on this basis. He stated that malnutrition, especially deficiency of protein, appeared to be the most probable cause.

The role of protein in relation to toxemia of pregnancy is still a debated problem. Arnell[31] found a higher incidence of toxemia among patients with a low protein diet than among those with a liberal intake.

Holmes[34] reported the incidence in women taking low protein diets to be twice as great as that in similar groups taking high protein diets. Burke and others[9a] found a significant relationship between the incidence of preeclampsia and the general antepartum dietary rating. While the protein intake was low in many of these cases, many other dietary essentials were also low, so that it was not possible to conclude that protein was the sole dietary factor involved. We wish to emphasize the difficulty in human studies of proving conclusively that a given nutrient is responsible for a given effect. Strauss[35] has contended that in the presence of protein insufficiency the colloid osmotic pressure of serum protein is altered. This causes edema and a consequent disturbance of the electrolyte balance which, in turn, may result in elevation of the blood pressure and other symptoms of toxemia.

Dieckmann[36] has, however, expressed the view that toxemia and a low protein intake are not related. Moreover, reports from certain areas in which starvation occurred in World War II have indicated that the incidence of toxemia fell sharply among pregnant women during the period of extreme food restriction. Smith[37] gave figures regarding the incidence of toxemia in Holland showing that during the months of acute hunger the incidence fell sharply. He discussed the possible explanations of this sharp contrast in findings.

Although there is still controversy among well informed persons concerning the cause of toxemia, it is generally accepted that a high protein diet does not predispose to the condition. The major weight of evidence would seem to indicate that toxemia occurs more often among chronically malnourished women than among well nourished women and that protein is one of the factors frequently deficient. The subject would appear to be an important one for further investigation.

For a further discussion of the effects of protein deficiency on both mother and fetus, the reader is referred to a paper on the subject by one of us.[38]

CALCIUM, PHOSPHORUS AND VITAMIN D

As a result of balance studies of Macy,[29] Coons[28b] and more recently Dieckmann,[28c] Oberst and Plass[28d] and others, it is an accepted fact that calcium and phosphorus requirements are considerably increased during pregnancy, if the maternal organism's own stores are to be maintained and fetal needs met. While the exact requirement for calicum is not known, these balance studies indicate that 1.5 Gm. of calcium daily during the latter half of pregnancy should allow sufficient calcium to meet the needs of the fetus and also permit an additional storage of calcium in the mother in preparation for lactation. Swanson and Iob[39] have shown that 65 per cent of the calcium and 64 per cent of the phosphorus of a full term fetus are deposited in the last two months of pregnancy.

The phosphorus requirement is somewhat higher than the calcium requirement and is probably in the neighborhood of 2 Gm. in the latter part of pregnancy. There need be little concern about phosphorus, however, since the protein-rich foods are liberally supplied with it and when protein and calcium needs are cared for phosphorus will usually be supplied in ample amounts.

Since vitamin D appears to aid in the utilization and retention of these two minerals, some additional source of this vitamin, a total of 400 to 800 international units, has been recommended daily. Liu and co-workers[40] and others have found that in the presence of an adequate supply of vitamin D the same degree of calcium retention is maintained on a somewhat lower intake of calcium but that in severe vitamin D depletion high levels of calcium and phosphorus will not maintain the subject in balance. The calcium and phosphorus requirements may well be conditioned by such factors as previous calcium and phosphorus stores, dietary custom and state of vitamin D nutrition. The protein and calcium requirements are also related.[41]

From a practical standpoint it should be remembered that the majority of women today enter pregnancy with low calcium stores and with poor food habits in regard to calcium-rich foods, namely, milk and its products. One quart of milk furnishes 1.2 Gm. of calcium, and only approximately 0.3 Gm. can be obtained from other foods in the usual diet. Without this amount of milk, therefore, it is impossible to meet fully the recommended calcium allowance of pregnancy. Milk must also be depended on for much of the phosphorus needed. Calcium tablets should not be recommended as a milk substitute for the pregnant woman, because considerable dependence also must be placed on milk as a source of other required nutrients. It has already been emphasized that the pregnant woman's need for protein is high and that 1 quart of milk daily supplies a little more than one third of that protein. Whole milk also is an important source of riboflavin, thiamine and vitamin A. In addition the number of calcium pills required to furnish the calcium equivalent of 1 quart of milk is so large that it usually will not be taken and will, if taken, often cause constipation.

Maxwell[42] has reported in considerable detail a number of cases of congenital rickets in the newborn of Chinese women suffering from osteomalacia. Dunham[43] and Rector[44] have also shown that fetal rickets or rickets in the early weeks of life may result from lack of calcium, phosphorus or vitamin D in the prenatal period.

Prenatal studies carried out by our associates and us[45] have shown a relationship between both the protein and the calcium content of the antepartum diet and the osseous development of the infant at birth. This was indicated by the presence or absence of certain osseous centers in roentgenograms of the hand, knee and foot. While both relationships are strong, that with protein appears to be somewhat stronger than that with calcium. A similar relationship has also been shown by these workers between the amount of calcium in the tooth buds as seen in lateral roentgenograms of the head at birth and the protein content of the maternal diet. A somewhat weaker relationship was also shown with the calcium content of the mother's diet. Toverud[46] reported that roentgenograms of newborn infants show great variations in the calcification of the teeth. He stated that this calcification is determined not only by the age of the fetus but also by the nutritional and general physical condition of the mother. Mellanby and Coumoulos,[47] Toverud and Toverud,[48], Burke,[49] Berk[50] and Massler and others[51] have accumulated data which indicate that the structure of the deciduous teeth is related to the prenatal diet. It would appear that unless the maternal diet allows for a liberal storage of calcium and other substances essential to sound tooth structure in the infant's body at birth, tooth structure may be further impaired in the early months of infancy.

IRON

The iron allowance of 15 mg. recommended for the latter months of pregnancy assumes that the woman enters pregnancy with adequate stores of iron and a normal hemoglobin level. Many women have depleted iron stores and a low hemoglobin level at this time. While balance studies by Coons[52] and Toverud[53] indicate that 15 mg. of iron are sufficient in many cases, Macy and Hunscher[29] considered 20 mg. a safer allowance. In a recent publication Toverud[48] favored 20 mg. of iron during the latter part of pregnancy to assure a positive balance. Various workers have shown that anemia during pregnancy is common both in this country and elsewhere, and it is generally accepted that the hemoglobin level is affected by diet. Garry and Wood[2] rightfully deplored the "lack of detailed information concerning the normal behavior of blood volume, of plasma volume and of the volume of packed red cells during pregnancy." Without such standards red cell counts and hemoglobin values are misleading.

In India a macrocytic hypochromic anemia is common during pregnancy and is a cause of high infant and maternal mortality. Napier and Edwards[54] have reported studies on 529 pregnant women in India. Although there was evidence of widespread secondary anemia, the majority of cases of anemia were also macrocytic in type. This type of anemia was also thought to be of nutritional origin, because of its higher incidence in the lower economic groups. When macrocytic anemia was encountered among the wealthy, a high incidence of vegetarianism resulting in diets of low protein quality and quantity was found. Bethell[55] has also reported this type of anemia, although its incidence in this country is not common. It has been found to yield usually to an increased intake of protein and/or of the vitamin B complex. In India liver therapy is often used. Recently folic acid[56] has been used successfully in treating macrocytic anemia of pregnancy.

One of the major causes of anemia of early infancy may be insufficient iron stores in utero resulting from anemia of the mother during pregnancy.

Iron in the diet comes in relatively small amounts from a number of foods. Food sources of iron include lean meat, liver, egg, potato, fruit (especially dried fruits), vegetables (especially greens and legumes), whole grains or enriched breads and cereals and molasses. If the pregnant woman has hypochromic anemia, medicinal iron should be given routinely in addition to a well balanced diet.

IODINE

In regions where goiter is endemic, iodine should receive especial consideration, since the physiologic changes incident to pregnancy may result in deficiency symptoms in either mother or infant or both.

VITAMINS

Vitamin D has already been discussed in relation to the requirements for calcium and phosphorus. Undoubtedly pregnancy increases the need for all the vitamins, but our actual knowledge in this field is limited, and much investigation is necessary before the requirements for the various vitamins during pregnancy can be stated with any degree of exactitude. Until more definite information is available the Recommended Allowances of the National Research Council seem desirable, although they may be unnecessarily liberal in some instances. It is better to err on the side of liberality in these instances, since there is no indication that a moderate excess is potentially harmful, and considerable harm may result from a deficiency during a period of rapid growth.

Vitamin A.—The vitamin A requirement of pregnancy is not known and the recommended allowance of 6,000 international units represents an arbitrary increase over normal adult requirements. In the average diet about two thirds of the vitamin A value is in the form of carotene; a smaller amount would be needed if all were provided as vitamin A. This amount is readily supplied in the daily diet by whole milk, eggs, butter or fortified oleomargarine and by the inclusion several times each week of a liberal serving of a dark leafy green or deep yellow vegetable. Liver at least once a week improves considerably the vitamin A content of the diet. Since most of the vitamin A is removed when milk is skimmed, it is much better not to substitute skim for whole milk as a means of reducing the caloric value of the diet, but rather to remove less desirable foods when necessary to limit calories. Mineral oil should not be used as a laxative or in salad dressing or other food combinations, especially during pregnancy, since it absorbs both carotene and vitamin A.

min A content of breast milk is high[79] and the infant's stores at birth are apparently relatively low. The thiamine allowance of 2 mg. represents only a slight increase over the amount recommended for pregnancy. The transfer of thiamine from the mother to breast milk is relatively poor but the maternal diet has been shown to be the principal determinant of the amount so transferred.[80] The recommendations of 3 mg. of riboflavin and 20 mg. of nicotinic acid are empiric. Macy and others[81] have shown that the concentrations of both of these vitamins are higher in the breast milk of women on diets of high composition than in the milk of women on self-chosen diets. The recommended allowance of 150 mg. of ascorbic acid rests on a somewhat sounder foundation.[82] The ascorbic acid content of human milk is much higher than that of cow's milk.[83] The allowance of 400 to 800 international units of vitamin D is the same as for pregnancy.

Those interested in more detailed information on the nutritional value of breast milk are referred to the recent papers by Macy and her co-workers.[84]

To insure an optimum diet throughout lactation each woman should be advised during late pregnancy and in the early postpartum period in regard to the changes which she should make in her diet for the period of nursing. An additional pint of milk—i. e., a total of 1½ quarts daily—furnishes the additional protein, calcium, phosphorus, riboflavin and thiamine suggested, as well as some of the additional vitamin A and calories. Liberal amounts of vegetables and fruits which should include the amount of citrus fruit recommended for pregnancy will cover the ascorbic acid allowance. Additional bread, cereals, potato and other foods of the woman's own choice usually must be included, because energy requirements are high during this period, but the extent of use of these foods must be varied in accordance with individual needs.

Deaths From Battle and Disease.—In World War II, 13 men died in battle for every man who died from disease. *In the Spanish-American War, the ratio* was reversed, 13 men dying from disease for every man dying in battle. In the Civil War, 71 men per 1,000 troops died from disease each year. If the same rate had prevailed during World War II, the Army would have *lost more than 1,600,000 men by* death from disease instead of the number actually lost—13,700. —*Bulletin of the U.S. Army Medical Department*, April 1948.

PHYSICAL TREATMENT OF ARTHRITIS

WALTER M. SOLOMON, M.D.

Cleveland

A difficult problem for most physicians is what to do for their patients with chronic arthritis. Unfortunately as yet there is no specific therapy; however, the physical methods are available and when properly and consistently used can be the most important single factor in the treatment of these patients. To be sure, since we are physicians we consider all the various medications, injections, diet, psychotherapy, surgery, etc., *that are indicated, but I believe the statement can* be made that, if one is deprived of everything else, one *can depend on the physical agents to* improve these patients both subjectively and objectively.

These measures to be most effective must be used frequently—that is, every day or even several times during the day. This means that the patient should be instructed on what to do in his home and calls for specific directions and methods that are relatively convenient, safe and inexpensive. I should like to stress these home treatments and give a few suggestions of what can be done. *Nothing* is better than the triad of heat, massage and exercise.

HEAT

Heat in any form increases the circulation to the part, relaxes the tissues and relieves pain. That cer*tainly justifies its use. Most* forms of heat are applied at least once a day, and two or three times a day are even better. *Many* methods of applying heat are available. The infra-red lamps are perhaps the ones most frequently employed. It is well to remember that the bulb type or the incandescent filament lamp penetrates to a greater depth than the so-called nonluminous form, which is made up of a solid iron rod or plate.

The color of the glass of the bulb type of lamp is a *point often* questioned. The glass from any of these lamps absorbs a certain percentage of the energy and a certain amount is lost by reflection. *By* physical laws a colored glass is likely to absorb more radiation than a clear glass, but this loss of energy is more theoretical than practical. The only benefit to be derived from the colored bulb is that it produces less glare than the *clear bulb. These* remarks are made since too often a physician buys a red-colored bulb with the hope that he *is securing a larger source of infra-red rays.*

Another factor of practical importance is the length of time that the joint or joints should be exposed to infra-red radiation. It has been found that the maximal elevation of the temperature of the skin is not reached until twenty minutes has elapsed, and the temperature *does not level off until after about thirty* minutes. This *indicates that a treatment should be at least thirty* minutes to secure the best physiological benefit. The practice of using a hand lamp for *five to ten minutes* is a waste of time. Thus in prescribing heat treatments for the home with an infra-red lamp it is well to consider the comfort and convenience of the patient. Separate infra-red bulbs are often purchased by patients *for use in their reading lamp or whatever they* have at home. This changing back and forth is troublesome

---

Read in a Panel Discussion on Physical Medicine in General Practice before the meeting of the Section on Miscellaneous Topics at the Ninety-Sixth Annual Session of the American Medical Association, Atlantic City, N. J., June 12, 1947.

and soon discourages even the most faithful. It is more practical to recommend a lamp that is mounted on a stand, either the floor model or the table model, since they are more likely to be used for the necessary time. Dr. Krusen has suggested the use of a cup-shaped polished reflector similar to those used in photography with photo flash bulbs. This reflector is attached by means of a ball and socket joint to a small clamp which may be fastened to the back of a chair or to the bed. One may use a 250 watt "Mazda" Cx bulb or a 200 watt carbon filament bulb in this lamp, and the entire outfit will not cost much more than $5 or $6.

A more elaborate and expensive means of applying infra-red radiation is by the baker, which is merely an oven-like affair in which four to eight incandescent bulbs are suspended. This is most useful if both knees or the lower extremities are to be treated. It is also useful for the back. These bakers may be secured from the War Surplus Administration, but this usually requires influence and an unlimited amount of patience. The Council of Physical Medicine of the American Medical Association will supply the details on making such a baker.

Another simple and inexpensive means of applying heat to joints is by the use of paraffin. All that is required is eight to ten pounds (3.6 to 4.5 Kg.) of paraffin such as is used to seal jelly or fruit jars and a container to heat it. A double boiler is more convenient and safer, since this prevents setting the paraffin on fire. The wax is melted and then removed from the fire, and when a thin film forms on the surface it is at the right temperature for the patient to use. If it is for the hands, he dips them in the paraffin and then removes them when the paraffin solidifies. This is repeated eight to ten times until a glove of about one fourth inch (0.64 cm.) or so has formed. The hands can then be wrapped in a bath towel for fifteen or twenty minutes, after which the paraffin is peeled off; it can be used over and over again. For joints other than the hands, a paint brush may be employed and the paraffin painted on.

When numerous joints are involved, as in rheumatoid arthritis, the full tub bath can be recommended, since it heats all the joints and has the additional advantage that, while the patient is in the tub, he can be urged to exercise the affected joints. The temperature of the water should not exceed 100 F., and the treatment should last about twenty minutes.

MASSAGE

After the use of heat in any of these forms, massage should follow. Physicians neglect massage because they know so little about this measure and more often than not have never been told or shown how to give a massage.

Massage is capable of producing definite physiologic effects which are most beneficial to the arthritic patient. The ideal would be to have a physical therapeutist give the massage daily, but this would be an expense which but few arthritic patients could tolerate; therefore some member of the family should be instructed in the method of giving a massage. In most instances the amateur masseuse can do a reasonably good job. If the physician cannot give instructions for massage he owes it to his patient to see that a physical therapeutist shows the methods to someone in the family. The technic of giving a massage is given in the "Handbook of Physical Medicine,"[1] the book that has been prepared by the American Medical Association for the general practitioner.

EXERCISE

After the heat has been applied and the massage has been given, the patient is ready for the exercises. This is one of the most valuable forms of physical therapy, particularly for the patient with the rheumatoid arthritis. Nothing is more pathetic than the plight of a patient with rheumatoid arthritis who has deformities and contractures which in many instances might have been prevented. It is believed that if such a patient will go through the full range of motion once each day for all the joints involved, he can be reasonably assured that he will not be a cripple. In the early stages of the disease the exercise are relatively simple and cause little pain, but if the patient is not properly instructed, he will delay movement of joints in hope that the pain will disappear. In too many cases it is then too late, for fibrosis, adhesions and even bony ankylosis may have occurred. In my opinion irreparable damage is done by advising the patient to go to bed and remain there until all swelling or pain has disappeared. This may take thirty or forty years. Immobilization results in weakness and loss of muscular tone and leads to atrophy and eventually deformities. On the other hand, a patient with rheumatoid arthritis is warned against too much exercise. Often such a patient exercises a joint as much as possible, hoping thereby to prevent stiffness. This also is incorrect.

During the relatively acute stage the exercises are done slowly and increased according to the tolerance of the patient. It is well to remember that certain muscle groups, such as the flexors and adductors lead to deformities; therefore exercises for their antagonists —namely, the extensors and abductors—should be stressed. In the beginning merely going through one or two movements for each joint will be sufficient; later this can be increased to several times during each day and, finally, by weight-bearing exercises. "Proper exercises never increase the activity of an arthritic process."

Exercise for the joints, although most important, is monotonous. There is no substitute for active movement of each individual joint; however, additional exercises may be suggested in the form of occupational therapy, which makes the patient forget the exercise in an effort to accomplish a task. This not only supplies the physical activity but has a psychologic incentive as well. By the proper methods this form of therapy can be directed to insure exercises for any joints desired. Occupational therapy is not confined to the hospital but should be used in the home, since many simple devices are available that can be suited to the interests of each patient.

A HOSPITAL DEPARTMENT OF PHYSICAL MEDICINE

All the physical measures that I have mentioned thus far are most effective and practical and relatively inexpensive and should be recommended for use in the home. There are other physical agents that are more complicated and costly and require more technical experience. This leads me to a subject that I would like to bring to your attention; namely, a department of physical medicine in a hospital. To the physicians in the larger cities and in the larger hospitals, the department of physical medicine is considered a necessity and is widely used in treating the arthritic patients; however, in the smaller communities it is rare to find a department of physical medicine. This also applies to the smaller hospitals in the larger cities. If such a department has proved to be helpful and worth while in larger hospitals, why should not its services be equally important in the other institutions? Today more and more physicians have equipped their offices with physical therapeutic apparatus, but few general practitioners have either the need for an extensive outlay or the time necessary to administer all of these treatments properly. The busy practitioner cannot afford to devote approximately an hour of his time for each arthritic patient, which may be necessary for such therapy. The solution to the problem is a department of physical medicine in the local hospital where the personnel, space and equipment may be made available. It is expected that the superintendent or administrators of the hospital will find objections for any additions or changes, but, if the demands are made, ways and means can certainly be found. The Council of Physical Medicine of the American Medical Association can be helpful in supplying plans for a small department and in telling about the services and means of securing physical therapists. The department in the hospital will provide the practitioner with facilities that are adequate and ethical. Unfortunately, too often the busy physician is forced to send his patient to masseurs, gymnasts or even members of various cults for physical therapy because the hospital in his community does not fulfil his needs.

---

[1] Handbook of Physical Medicine, Chicago, American Medical Association, 1945.

Of course a department of physical medicine in a hospital would be utilized for the treatment of all diseases and disorders. However, it is the patient with chronic arthritis who receives the greatest benefit and who keeps the department busy. The assistance from such a department and the all-important physical treatments which are prescribed in the home will secure results that assure the greatest satisfaction to both the physician and the patient with arthritis.

PHYSICAL MEDICINE IN THE TREATMENT OF THE AGED

WALTER S. McCLELLAN, M.D.*
Saratoga Springs, N. Y.

The aging person is faced with the possibility of gradual physical and mental deterioration. On the physical side, changes occur in the elastic tissues of the body, such as those found in the blood vessels, as well as in the synovial membranes of joints and the skin. These changes produce physiologic alterations associated with a decrease in the rate of tissue exchange and in the nutrition of the affected part. Many of the mental conditions result from vascular changes in the cerebral vessels which affect the circulation of the brain. Diminishing acuity of vision and hearing also are common findings in the aged.

In discussing the subject of physical medicine in these persons one has the valued presentations of both Dr. Krusen[1] in *Geriatrics* and Dr. Kovacs[2] in his chapter in Stieglitz's book, "Geriatric Medicine"; they have presented a careful outline of the physical medicine procedures available, with reference to their particular application in geriatric patients. I wish to approach the problem more directly from the standpoint of the patient, with a consideration of some medical and surgical conditions which commonly afflict patients in the older age groups and to indicate briefly how physical medicine can aid the patient with these conditions.

In the data on conditions which are prevalent in the older age group there are differences, depending on whether one considers the mortality, prevalence or disability statistics. At the head of the causes of death is heart disease with associated vascular conditions, and in second place comes cancer. If prevalence is taken as the guide, then the cardiovascular ailments come first and rheumatic conditions come second. When chronic disability is the test, then nervous and mental diseases lead with cardiovascular ailments and rheumatic conditions in second and third place, respectively. Physical medicine is not the only form of therapy which is applicable in these conditions, and any comments which I make about physical therapy must be coordinated in the whole program. Only when the physician brings into play all forms of therapy will the patient obtain the maximum benefit from his medical care.

NERVOUS AND MENTAL DISEASES

The melancholias frequently occur in aging patients, particularly during or following the climacteric. For these patients electric shock therapy is widely applied. I do not wish to detail the specific technics in this field, but only to point out that this method of treatment is the application of a physical agent.

For the patients with senile psychoses or psychoses associated with arteriosclerosis the simple forms of heat in definite moderation may be useful. The very simplest forms of heat which can be regulated more by the temperature of the room than any local application may be all that is safe for these patients. Such exercise as the patient's condition will allow is of value in preventing even a more rapid deterioration. The big contribution of physical medicine is the use of occupational therapy, the teaching of the patient to do some particular piece of work instead of just letting him sit and gradually deteriorate. Occupational therapy will not stop the progress of aging in these patients, but the later years of their lives will be much more happy years if the occupational therapeutist provides them some simple work activity. It must be within their mental capacity and not sufficiently exhausting to tire them physically.

Dinkin[3] has recently outlined a plan for the study and treatment of the patient with hemiplegia. Motor function tests, which indicate the power available in the different muscle groups, as well as activity tests which determine how well the patient uses the remaining power, are necessary. The physical measures used are dependent on how much the patient is able to do. He recommended the use of passive exercises; the physical therapeutist puts the extremities through the maximum range of motion possible once or twice a day to prevent contractures and to increase the confidence of the patient. One should start this early and not wait for the development of contractures or other limitations. Simple pulley exercises performed by the patient are useful for treatment of limited shoulder motion. They aid in restoring confidence because the patient uses his good arm to move the paralyzed arm.

---

Read in a Panel Discussion o [illegible] l Practice before the meeting of the Sectio [illegible] e Ninety-Sixth Annual Session of the [illegible] Atlantic City, N. J., June 12, 1947.

[1] Krusen, F. H., and Leden, U. M.: Some Applications of Physical Medicine in Geriatrics, Geriatrics **1**: 409 (Nov.-Dec.) 1946.

[2] Kovacs, R.: *Principles of Physical Therapy as Applied to the Aged,* in Stieglitz, E. J.: Geriatric Medicine, Philadelphia, W. B. Saunders Company, 1943, chap. 7.

[3] Dinkin, H.: The Evaluation of Disability and Treatment in Hemiplegia, Arch. Phys. Med. **28**: 263 (May) 1947.

Daily galvanic or faradic stimulation of flaccid muscles to maintain tone and weight is suggested. Massage may be of some aid, but it will not put power into a paralyzed muscle. Important are muscle reeducation and walking exercises.

Occupational therapy is important for the development of the functional activity, projects being used which call for the use of the affected hand, arm or leg. They should include the technics of dressing, eating, standing, walking, etc., all of which are important in the activity program of the hemiplegic patient. Dinkin stressed the great value of starting early, having a definite plan, the building of morale and a persistence in the work as important factors leading to success in caring for the hemiplegic patient.

The patients with paralysis agitans or the Parkinson syndrome need to be treated with a definite program of activity. Exercise is important. However, it must be moderate to avoid fatigue. Many of these patients can perform fine movements when they are unable to perform large sustained movement in any one direction. Massage and relaxing baths have been recommended in this group, but they are generally found to be of only temporary aid and the disease process seems to progress in its usual form. It has been my good fortune to follow a number of these patients for a period of years, with the use of the natural carbon dioxide bath. Inasmuch as many among these patients have a vascular disturbance, some improvement has been noted in this program. However, over a period of years, I have not been able to demonstrate that it has prolonged life. It has helped them to live more comfortably in their declining years if this bathing program is followed regularly.

CARDIOVASCULAR AILMENTS

Every physician is familiar with the many patients in the older age groups who suffer from progressive coronary disease, hypertension and, to some degree, myocardial failure resulting from these two conditions. Arteriosclerosis and other vascular conditions may limit the supply of blood available to an organ or extremity. In the past physical medicine has not been considered to be an important arm of therapy in the heart conditions, although it has received considerable attention for the patient with peripheral vascular disease. Some publications have stressed recently the importance of a physical program of treatment, not to provide a complete cure but for aiding the cardiac patient so that he could live a more comfortable and, in some cases, a more active life. The program for this group might well be divided into two parts.

First, there is the program which can be used at home, where many patients who are limited in their activity because of decreased cardiac reserve may well benefit from simple passive and mild active exercise, as well as from the use of massage during their period of inactivity. The intelligent application of these physical measures is helpful in preventing muscle deterioration and in keeping the patient in better physical condition to take up increased activity as his cardiac condition improves. The extent to which this program may prevent the development of peripheral thrombosis and subsequent pulmonary emboli can be determined only after a long period of study with corresponding control groups. There should be a happy medium between the long continued bed rest for the patient with coronary occlusion and infarction as compared with too short a period for these patients. Physical medicine can be of value to the internist in his program of handling this group of patients.

The second phase of the physical medicine program as applied to the patient with heart disease has been built around the spa, where the cardiac patient follows a program of bathing in carbon dioxide mineral waters for a period of two to four weeks, once or twice yearly. Comstock and Stroud[4] have discussed this program, as have Lambert,[5] Leaman[6] and McClellan.[7] There is evidence to indicate that the absorption of carbon dioxide through the skin from the mineral water bath produces a direct influence on the smaller peripheral vessels. It is accumulated in the body and an increased output through the lungs of 10 to 25 per cent occurs. The clinical studies reported indicate that these patients have less anginal pain and are able to exercise to a greater degree without evident discomfort than they could before.

In peripheral vascular disease, particularly associated with arteriosclerosis, numbness, tingling and the usual symptoms resulting from diminished circulation in the extremities are reported. The physician may say, "Well, apply some heat to the extremities." Without careful specification of the type and amount, the patient overdoes the application, resulting at times in severe burns. Heat is of value, but only in distinct moderation and applied in such a manner that there is no possibility of raising the temperature of the extremity beyond the temperature of the body. It is best applied in a heat cradle or baker with a thermostatic control. Gentle applications of infra-red heat are useful but again must be carefully checked not to overheat an extremity. The use of hot packs, mud packs, diathermy and even baths above a temperature of 96 F. may be detrimental. There is value for these patients in heat, but it must be moderate. It also is important that the form of heat used shall be available for considerable periods of time.

Contrast baths—namely, the exposure of the extremity to hot water and then to cold water—have been suggested by some writers, but Wright,[8] in his recent review of the problem, expressed the opinion that this procedure is dangerous for these patients. I would agree that they do not respond well to sudden changes of temperature, and in the ideal treatment one seeks moderation in temperatures as well as activity, avoiding the extremes of either heat or cold.

Other forms of physical medicine have been applied. There have been considerable differences of opinion in the results obtained from the suction pressure apparatus, from the apparatus which permits intermittent venous occlusion and from many of the electrical procedures. There are some who feel that properly applied diathermy to the lower part of the back may be helpful in releasing some of the spasm associated with the limited circulation of the lower extremities. With Dorrance,[9] I was able to study the amplitude of pulsation in a considerable number of patients before and after the carbon dioxide bath. In some we found a definite increase in the amplitude of pulsation. This was less marked in the lower extremities than in the upper extremities. It appeared that in many of these cases organic disease or arteriosclerosis is associated with spasm in the peripheral vessels of the lower extremity. The use of the bath brings about some decrease in spasm, allowing for an increased pulse amplitude. If the changes in the patient were primarily organic, then we found little or no change in the pulse amplitude. We concluded that the response of the patient to physical measures such as the bath and others of a similar type will largely depend on what proportion of the limitation is due to the spasm and what to organic arteriosclerosis. When the latter predominates, then one can expect little change in the amount of blood passing through the occluded vessels. These measures help to make use of the available channels to the best advantage and should be carefully selected and applied in this group of patients.

The program of treatment should provide for the whole day. It is of little value to apply gentle heat to an extremity of a patient in the clinic and then have him go by bus or streetcar through the chilly day to his home, as the exposure to the cold will many times more than counteract the benefit obtained from the treatment.

RHEUMATIC CONDITIONS

Physical medicine has probably had its widest application in the treatment of arthritis and related conditions. Most of these patients seek some form of baths or other physical treatment sometime in the course of their disease. In the aging patient, osteoarthritis is more common that rheumatoid arthritis, although no age group is free from rheumatoid arthritis. Gout will manifest itself in many age groups, and, while it may not commonly start in the older patients, it will cause disability from its persistence over many decades.

In the treatment of arthropathies, particularly of the rheumatoid type, tested measures include, first and foremost, rest, particularly in the acute phases. The application of heat from various sources is soothing, but in the acute swollen joints it often will aggravate and will increase the discomfort. It may properly be applied during the convalescent period when the residual swelling and exudate will produce limitation of motion. Important also is the application of gentle massage, not to the inflamed joint, but to the muscles acting about the joint. This is of particular value in helping to maintain good muscle condition. Exercise should be started early, beginning with the passive movement through the possible range of motion once or twice daily in order to prevent limitation and stiffening. It may be extended as the patient's condition improves to a more vigorous, active program in this field, the goal in the application of physical measures being to avoid overtreatment but to prevent muscle deterioration and contracture. With properly applied physical measures, prevention must be stressed because it is easier to prevent than to correct a troublesome, crippling condition.

Patients with osteoarthritis will tolerate heat in greater amounts with the use of heat cabinets or warm baths. They also tolerate sedative massage and rhythmic exercise, and in some even the contrast bath may be used. Most of the patients with osteoarthritis can tolerate a more vigorous program of treatment than can the patients with rheumatoid arthritis. However, the intensity of the treatment would largely depend upon the general condition of the patient, and a careful observation of the patient's response to the treatment is important in checking his progress. If the patient suffers additional pain beyond an hour following the treatment, or if there is evidence of increased strain on the heart as evidenced by faster, rapid pulse rate, then the program must be modified to meet the needs of the patient.

Physical measures recommended for patients with gout include both hot and cold applications to the acutely tender joint. Observation of a considerable number of patients indicates that these applications give at least temporary relief; in some patients they appear to shorten the period of disability. They do not, apparently, modify the course of the disease, but their use is justified because they give relief.

In other forms of rheumatic disorders, such as neuritis, fibrositis and myositis, physical medicine can do a real job. It must be specifically applied, and time does not permit the outline of detailed physical measures for each condition. The general principles already outlined apply here.

TRAUMATIC CONDITIONS

The elderly person is subject to falls and injuries, with resulting fractures and other traumatic conditions. Physical measures can give relief and can shorten periods of disability. It is important to keep the portions of the body which are not affected in as good condition as possible with the use of corrective physical exercises and movements which will prevent deterioration and loss of muscle power in the good extremity or in the remainder of the body as a whole. When properly applied they will keep the patient in better condition to become active after the fracture or injury is healed. Again, as in the other sections of this discussion, the early application of heat in the region of the fracture is of value but should be in moderation. Diathermy is not indicated, as there is some evidence that it may delay the healing of fractures. Gentle movement as early as possible in the hands of an experienced therapeutist is of value. The amount and the extent of this movement and exercise must, of course, be indicated by the physician in charge, as he is familiar with the disability. The program for these patients carries on through the convalescent period, during which both physical therapy and occupational therapy can play a real part in aiding a patient in his return to a more normal natural period of activity. This is true for the older patient as for those in the active working period of life. In the older age groups some consider that treatment work of this type is not productive because of the limited years of life expectation ahead. It is of value in reducing disability and discomfort.

GENITOURINARY CONDITIONS

Outside of the use of electrosurgery in the field of prostatic operations, physical medicine has not been widely applied. Many physicians have recommended for prostatic congestion and pelvic inflammatory disorders the use of the hip bath, known as the "sitz" type of bath. This will give considerable relaxation but in no way is a substitute for a careful study, diagnosis and treatment of the medical condition. Local fever therapy does not seem to be stressed as greatly today as a decade or two ago. The use of diathermy will give relief in many pelvic conditions, but it must be used with caution wherever infection is present.

SUMMARY

There are a number of questions which physicians may properly raise and to which attention should be given in view of the recommendations that I have discussed. The first question is how can the general practitioner provide these measures. The physician sees the large physical therapy department with its many machines and appliances and feels that it is beyond his ability to provide this service. A more careful study of physical medicine stresses the need for the development of simple home procedures such as can properly be applied by the patient alone, or by someone in the patient's family. This eliminates the tiresome trip to the clinic and even the occupancy of a hospital bed, and offers the opportunity for a more frequent application of the procedures. In any place where the patient has electric current or a water supply or some method of heating the water, many of the applications which I have mentioned can be used. In many a home there is no bathtub available. However, when it is present, the use of baths at various temperatures can be prescribed, and they have a real soothing effect for many of the conditions producing discomfort in the aging patient.

One hears much about rehabilitation today. For the aged patient, rehabilitation means making life more comfortable for the patient, making him feel that he is needed and wanted by society. Physical medicine, with its associated programs of physical and occupational therapy, and corrective physical exercises can play a great part for this group of patients in helping them the better to carry on through the declining period of life.

One phase of physical medicine relating to the aged patient should be stressed. I have to this point been discussing definite physical diseases and ailments. Physical medicine has a part in the preventive field among the aged. A proper program of exercise, of massage, of the use of baths such as provided in the spas, is of value in keeping the aging patient in good condition, making unnecessary, perhaps, some of the specific application of physical medicine for medical conditions. One form of physical medicine which is neglected is the field of exercise, and in particular proper breathing exercises. Due to the inactivity of the elderly patient, he breathes in a very shallow manner. The respiratory exchange is at a minimum. There may be a deficiency of oxygen due to this failure to carry out the breathing exercise properly. A regular program of deep breathing will provide the patient with an increased amount of oxygen and will improve the general condition of the patient.

One question which arises in this group is how far to permit exercise. In the aged should one not limit activity? This can be answered only by a careful consideration of the individual patient. The aged King of Sweden has played tennis until recently. Others who have not attempted regular exercise through most of their middle life will find this too strenuous. Golf has, of course, had its place. Many players in their seventies and even in the eighties are playing golf today and derive a great deal of benefit from it. However, telling a patient at 70 or 75 to start playing golf is, I believe, a mistake. In other words, no one can determine for a patient the amount of exercise that can be allowed, but it must be determined for each person on the basis of his physical and mental capacity.

One final word in the application of physical medicine in the aging patient is the requirement and recommendation of dosage. This, I believe, should be stressed and if this procedure is followed carefully, through moderation and careful prescription of the physical medicine procedures some of the damages will be avoided which are unfortunately mentioned as a result of use of physical medicine.

PHYSICAL MEDICINE AND THE LAME BACK

FRANK R. OBER, M.D.
Boston

The main object of physical medicine in instances of lame back is to restore the normal physiology of the spine. It must be remembered that backache is only a symptom of some underlying postural difficulty, trauma or diseased condition which produces a train of events resulting in pain low in the back. In addition to this, there may be pain in some of the nerves of the lumbar or sacral plexus, the sciatic nerve being most frequently affected.

The integrity of a joint depends on a normal alinement of the articular surfaces, strong ligaments and a normal musculature which moves and aids in supporting that joint. When disease, injury or postural abnormalities occur, this whole mechanism is thrown out of gear. The muscles which support and activate the joints lose tone and strength, with the result that additional burdens of stress and strain are thrown on the supporting structures and cause pain. If the pain continues, atrophy and spasm of the muscles increase and the disturbance is prolonged.

Recurrent attacks of backache are likely to occur even after slight injuries or certain minor movements *if no attempt has been made to restore normal spinal* function or the normal physiologic curves of each individual spinal division or segment. Prolonged distortion of these curves is too likely to be the fundamental cause of the recurrent, chronic lame back.

In the acutely lame back, relief of pain by rest in bed, plus sedatives, is indicated. The bed should be firm and the mattress flat. If the bed sags, a board 20 inches (51 cm.) shorter than the spring should be placed under the mattress. The board must not be used if it makes the patient more uncomfortable. A great deal of pain is due to muscle spasm, which can be alleviated by sedatives, the type and the frequency of the dose depending on the amount of pain and the relief obtained. Sometimes constant bed therapy is irksome. In that case, the patient should be allowed to sit up, out of bed, for short periods. This often decreases the discomfort.

HEAT

Hot packs applied for fifteen or twenty minutes twice a day are most helpful. Baking with a heat lamp for the same length of time also gives relief, but prolonged heating is not curative, as it increases congestion. The object of the heat is to relieve congestion; it does not decrease atrophy or heal injured or diseased tissue.

MASSAGE

In acute back trouble, massage must be used with discretion; it should be in the form of gentle effleurage. Too many backs are made worse by plowing and heavy massage. The object of the massage should be

---

Read in a Panel Discussion on Physical Medicine in General Practice before the meeting of the Section on Miscellaneous Topics at the Ninety-Sixth Annual Session of the American Medical Association, Atlantic City, N. J., June 12, 1947.

to promote circulation and the relaxation of muscle spasm. Some patients do not tolerate massage at all; it must not be used in such persons. The well trained physical therapeutist should be able to recognize such idiosyncracies. When the patient is able to be up, his back should be protected by a well fitted corset or some adequate support.

EXERCISES

When the pain and muscle spasm have subsided, special exercises should be prescribed in order to help restore function and maintain the physiologic curves of the spine. The principal supporting muscles of the lower part of the back are the large gluteal and abdominal muscles. After a severe episode, the first course of exercises should be devoted to increasing the tone of these two groups of muscles; one begins by instructing the patient, while lying on his back, to contract his glutei maximi. This should be done five times every half hour throughout the day and gradually increased until it is done one to two hundred times daily. This maneuver must be slow, firm and steady. Short, jerky movements will not develop muscle tone and may cause pain. If there is no recurrence of pain, the patient is next instructed to raise his head and shoulders a short distance from the bed, when in a supine position. He should do this five times every hour, holding this position for two or three seconds at a time. This exercise should be gradually increased until it is done one hundred times through the day. As the muscles show firm tone and good power, fifty exercises morning and night should be performed. When one gluteal muscle is smaller than its fellow, the patient lies on his face with a pillow under his abdomen and hyperextends his thigh on the atrophied side against gravity. This should be done a few times every hour, later on fifty being done twice daily.

If the iliotibial bands and anterior fascia lata are contracted, the lateral fascia is stretched by leaning sideways in a doorway or with a hand on a bureau, so that the body and affected leg form an arc with the bow toward the affected hip. Usually five to fifteen stretches, twice daily, will stretch out the iliotibial bands and help to relax a restricted straight leg raising. Later the anterior contracture is stretched by pulling on the ankle so as to increase knee flexion. The thigh must be held in line with the body. Stretching of fascia lata must not be done in the presence of sciatic pain, because to do so will only aggravate the pain. Forward bending exercises while standing are likely to produce pain and must not be given until all the contractures have disappeared.

Many patients who have pain low in the back have short heel cords and short hamstrings. Short heel cords are often a factor in producing pain in the back in those who stand for long hours in a forward bent position. This condition may be relieved by standing with the ball of the foot on a book or board and let the weight of the body do the stretching. The knees must be completely extended in order to get the full benefit of the stretch. The shortened hamstrings can be stretched by the patient, who is instructed to stand on one leg and to place the heel of the other, knee extended, on a low chair or stool. He then bends forward slowly as far as he can and remains in that position for at least three seconds, repeating several times (ten to twenty) two or three times a day. This is persisted in until he is able to reach the floor with his fingers without flexing his knees. When all contractures of the hamstrings, calf muscles, and fascial structures have been relieved, and the muscles which protect and support the back have normal tone, contour and strength, exercises to correct faulty posture should be prescribed and continued until normal posture can be maintained without conscious effort.

Occasionally one sees a type of stiff back in which it is not possible to reverse the lumbar curve by forward bending. This condition is difficult to overcome, but it can be accomplished by prolonged protection and physical measures devoted to stretching the lumbar fascia and muscles in the following manner: The patient is instructed to lean over several times a day, first in a chair and later in the standing position, as far as possible, remaining there for at least one minute without straining and as relaxed as possible. One other exercise is also helpful, and that is done in the supine position. The patient flexes the knees and thighs and grasps his knees with his hands and rolls them toward his chin, holding the position for several seconds, ten or fifteen times at least twice daily.

When a spine has been operated on to relieve pain in the back, exercises to restore muscle function will shorten the convalescent period. It must be borne in mind that operations involving joints are a form of trauma and that muscle atrophy occurs afterward.

SUMMARY

Heat, massage, and proper exercises will result in the cure of many lame backs. Heat and massage are helpful but do not restore power. Exercises to develop musculature will restore power and function. Exercises to correct faulty posture, secondary to the lame back, will minimize the severity of later attacks and often give permanent results.

PHYSICAL TREATMENT OF COMMON DERMATOLOGIC LESIONS

ANTHONY C. CIPOLLARO, M.D.
New York

All branches of medicine have made tremendous advances during the past two decades. Many of the advances in dermatologic therapy have been made in the field of physical medicine. New technics have been devised, old ones have been improved and new physical agents have been introduced into the armamentarium of the dermatologist.

To appreciate the importance of physical therapy in dermatology, one has only to peruse the agents employed in the treatment of diseases of the skin. Among these agents are ionizing radiations, especially roentgen rays and radium. Agents which emit alpha rays, such as radon in ointments and gases, thorium X in solutions and ointments and polonium in solutions, have been used to a limited extent. Encouraging results are being reported with the use of radioactive isotopes in the treatment of systemic diseases having cutaneous manifestations such as mycosis fungoides, Kaposi's sarcoma, leukemia cutis, Hodgkin's disease and polycythemia vera. Perhaps the literature of the near future will have recorded the successful use of radioactive isotopes for such diseases as exfoliative dermatitis, chronic universal psoriasis and the large group of generalized

From the New York Medical College, Flower and Fifth Avenue Hospitals.

recurrent and chronic papular erythrodermias, subacute lupus erythematosus, pemphigus, dermatitis herpetiformis, multiple primary and metastatic cutaneous malignancies and perhaps even xeroderma pigmentosum. Even the severe generalized fungous diseases such as blastomycosis and actinomycosis might respond to the internal administration of radioactive isotopes. The future of atomic energy for the study and treatment of dermatologic conditions is full of possibilities.

ROENTGEN RAYS AND RADIUM

The use of roentgen rays and radium in the treatment of skin disease is no longer an experiment. There are over eighty skin diseases which respond well to treatment with roentgen rays or radium. Amongst this group may be mentioned angioma, acne vulgaris, actinomycosis, blastomycosis, granuloma coccidiodes, dermatophytosis, favus, tinea capitis, onychomycosis, mycosis fungoides, leukemia cutis, Hodgkin's disease, Kaposi's sarcoma, epitheliomas, some cases of melanoma, neurodermatitis, psoriasis, lichen planus, verrucae, furunculosis, carbunculosis, keratoses, keloids, hyperhidrosis and tuberculodermas including scrofuloderma and tuberculous adenitis. The most effective therapeutic agent to control the present epidemic of ringworm of the scalp has been the application of temporary epilating doses of roentgen rays to the entire scalp.[1]

ULTRAVIOLET RAYS

Ultraviolet radiations are not as extensively used in dermatology as in former years, but they are used more critically and in a more precise manner. The average dermatologist employs in his office or clinic an air-cooled and a water-cooled hot quartz mercury arc lamp and a "cold quartz" type of lamp. He also employs black light or "Wood's light" for diagnostic purposes. In fact, were it not for this type of filtered ultraviolet ray generator, it would have been impossible to begin to control the nationwide epidemic of ringworm of the scalp raging among the school children of this country. With "Wood's light"[2] it has been possible to detect and isolate those afflicted with the disease who show no clinical manifestations of it.

Ultraviolet rays[3] have been found useful in a large number of diseases of the skin, the most important of which are acne vulgaris, dermatophytosis, neurodermatitis, eczema in infants, eczema seborrheicum, furunculosis and folliculitis, pityriasis rosea, parapsoriasis, essential pruritus, psoriasis, tuberculodermas, including lupus vulgaris, scrofuloderma, erythema induratum and orificial tuberculosis, and some slowly healing ulcers and wounds. The Goeckerman treatment for psoriasis, which consists of the application of crude coal tar ointment prior to exposure to ultraviolet rays, has been found particularly efficacious for this stubborn and recalcitrant disease.

The bactericidal rays of the cold quartz type generator are useful in the treatment of some infected ulcers and wounds and may cause quicker involution of impetigo contagiosa, pemphigus neonatorum and other pyodermas. Because "cold quartz" ultraviolet rays cause exfoliation, they are useful in the treatment of pityriasis rosea, tinea versicolor and pits and scars following acne vulgaris and smallpox.

Before leaving the subject of ultraviolet rays, it is necessary to emphasize that they should never be used in the treatment of lupus erythematosus because after an intense reaction some cases of discoid lupus erythematosus may become generalized and terminate fatally. Germicidal ultraviolet ray lamps have not been used as yet to any extent by American dermatologists for the treatment of diseases of the skin. At this time I know of no evidence that would support the contention that short wave length ultraviolet rays would prevent pemphigus neonatorum, impetigo contagiosa and other pyodermas.

HIGH FREQUENCY CURRENTS

High frequency currents[4] are used for medical and surgical purposes. Fever therapy has been used for the successful treatment of neurosyphilis and for some cases of generalized chronic and recalcitrant dermatosis. High frequency currents are used mostly in dermatology for destructive purposes for such lesions as keratoses, leukoplakia, nevi, papillomas, epitheliomas, Bowen's disease, melanomas, fibromas, granuloma pyogenicum, cutaneous sarcoids, small lesions of lupus vulgaris and lupus erythematosus, verrucae and xanthomas. Hypertrichosis[5] can be safely and effectively treated with high frequency currents provided the equipment is especially constructed for this type of microdestruction of hair follicles.

GALVANIC CURRENT

The galvanic current[6] is used for common ion transfer especially for the treatment of dermatophytosis, pompholyx, nummular eczema, varicose ulcers, scleroderma and Raynaud's disease. In dermatology, the galvanic current is used mostly for the destruction of such lesions as hypertrichosis, telangiectases, nevi, keratoses, adenoma sebaceum, benign cystic epitheliomas and verrucae.

SOLID CARBON DIOXIDE

Refrigeration with solid carbon dioxide is useful in the treatment of verrucae, nevi, angioma, larva migrans, keratoses, many pigmentary disturbances, lupus erythematosus and lupus vulgaris. A paper is being read at this centennial meeting of the American Medical Association on the use of liquid oxygen for the treatment of many small lesions of the skin,[7] most of which have been mentioned in this paper. Liquid oxygen is so cold that it acts as a cauterizing agent.

OTHER AGENTS

Other agents used in dermatology are balneotherapy, posture, massage and infra-red rays. Time does not permit discussion of these agents. However, baths containing such medicaments as starch, bran, magnesium sulfate, sodium bicarbonate, tar, sulfur, gentian violet, silver nitrate and potassium permanganate are useful for such diseases as exudative and extremely pruritic eczematous eruptions, pemphigus, dermatitis herpetiformis, extensive folliculitis and multiple furunculosis, impetigo of the newborn, urticaria and ichthyosis. Some long-standing extensive dermatoses may be debilitating, and baths may be used for their tonic, stimulative or sedative effects. Beneficial effects from strapping and posture are noted in those cutaneous diseases secondary to vascular disturbances, such as in ulcers and wounds secondary to varicose veins, Raynaud's disease, diabetes transverse myelitis and syringomyelia. Massage is useful for such conditions as alopecia, keloids, contracted scars, scleroderma of the localized and generalized varieties and sometimes is useful in pitted scars after a severe case of acne vulgaris. Physical medicine plays a tremendous role in all branches of medicine and certainly a most important role in dermatology. Were it not for the advances made in physical medicine it would have been impossible for dermatologists to attain the high percentage of good therapeutic results in the management of many recalcitrant dermatoses. Further critical scientific studies will help better to evaluate the use of physical agents in dermatology.

PHYSICAL MEDICINE IN THE TREATMENT OF FRACTURES

MILAND E. KNAPP, M.D.
Minneapolis

During the decade just elapsed the importance of physical medicine in the treatment of fractures has become increasingly recognized by the rank and file of the medical profession. In the past the attention of the surgeon has been focused primarily on the bone itself, and treatment has been designed to obtain adequate reduction and firm fixation of the bony fragments in order to obtain good union in good position. Often this has been accomplished by the use of heavy casts immobilizing many joints without consideration of the effect on the soft tissues. Such an attitude was unfortunate because the bones are only the supporting framework of the extremities and efficient function is the result of the normal interplay of muscles, tendons and joints under the control of an efficiently functioning nervous system.

The local treatment of a fracture is no longer merely a question of obtaining adequate reduction as shown by roentgenograms, holding that position by splints or traction until the bone is firmly united and then hoping that some degree of usefulness of the member will eventually supervene. It is a complex situation in which treatment of all the other component parts of the extremity is as essential as treatment of the bone itself. This has increased the complexity of the problems associated with treatment of fractures because there are two apparently antagonistic objectives to be attained. The fractured bone ends must be held immobile in constant apposition to aid the progress of union, while at the same time motion must be encouraged in the muscles and joints to aid in the removal of hemorrhage and exudates and to prevent the undesirable sequelae of muscle atrophy, swelling, joint stiffness and circulatory changes. In the solution of these problems physical aids are becoming increasingly important.

MOST COMMON CAUSES OF DISTURBED FUNCTION

The most common causes of disturbed function resulting from fractures are the following: (1) malposition and malunion, (2) nonunion, (3) joint stiffness, (4) muscle atrophy and (5) circulatory disturbances. I will discuss each of these causes individually.

1. *Malposition and Malunion.*—Malposition and malunion cannot be treated successfully by physical medicine. It is absolutely essential that an adequate reduction be obtained by closed methods, if possible, but by open operation if that is necessary. Physical therapy is not a substitute for reduction.

2. *Nonunion.*—Not all the causes of nonunion are well defined. However, there are several well known factors which promote nonunion. Motion at the fracture site tends to promote nonunion by breaking the capillaries which are attempting to grow into the fibrous callus and thus disturbing the blood supply to the part so that nonunion is a result. It is therefore essential that adequate immobilization be maintained at the fracture site. The bone must be held immobile. However, this does not mean that the entire extremity must be immobile. Normal circulation to the part is also important in obtaining good union. Blair [1] has emphasized the importance of alternate hyperemia and ischemia such as is obtained by normal muscle function. Anything which tends to make the circulation to the part more normal will also tend to assist the healing process. This does not mean, however, that the application of heat alone will assist the healing process: if the heat is efficient enough to cause long-continued hyperemia, the result will be a decrease in calcification, since continuous hyperemia causes absorption of calcium from bone. Active use of the part, especially after union has started, tends to make the union more firm.

Stiffness, Muscle Atrophy and Circulatory Disturbances.—Joint stiffness, muscle atrophy and circulatory disturbances may be grouped together in discussion of their causation and treatment.

The injury which accompanies a fracture is not limited to the bony structures. It is obvious that the force causing a fracture is transmitted to the bone through the surrounding soft tissues. It is equally as apparent that trauma to the soft tissue is the inevitable accompaniment of fracture of the bone. This soft tissue injury manifests itself in numerous ways. There may be hemorrhage into muscle, fascia, joint and areolar tissue. That this frequently occurs is evidenced by the usual presence of discoloration and swelling following fracture. The hemorrhage may be limited to a comparatively small hematoma in the region of the fracture or may involve an entire extremity and in some cases may even extend to the trunk. At the same time there is usually a decided swelling which cannot be accounted for by extravasated blood. This apparently is an extravasation of lymph or tissue fluid. The resultant edema may be so pronounced that the normal landmarks of the extremity are totally obscured. Only a few hours are required for this swelling to develop to its fullest extent. Thus the ordinary fracture is complicated by the presence of soft tissue swelling which must be treated in addition to the bone injury.

The removal of this extravasated blood and tissue fluid is accomplished either by absorption into the blood stream or by the organization of its fibrinous components into fibrous tissue which may interfere materially with the function of the extremity. If the circulation to the part is adequate, the major portion of this exudate may be removed in a relatively short time by the natural process of absorption into the venous circulation. If, on the other hand, the circulatory efficiency of the veins and lymphatics is moderately impaired, as is commonly the case after trauma with its resultant muscle spasm and inactivity, organization proceeds at a rapid rate. According to Murray [2] this organization is well started within

[2] Murray, C. R.: Immediate and Early Physical Therapy in Management, Arch. Phys. Therapy **19**: 74 (Feb.) 1938; The Exact Role of Physical Therapy in the Treatment of Fractures, Surg., Gynec. & Obst. **56**: 479 (Feb., no. 2A) 1933; Proper Place of Physical Therapy in the Treatment of Fractures, J. A. M. A. **97**: 235 (July 25) 1931.

seventy-two hours and by the end of ten to twelve days has progressed to considerable magnitude. He stated: "In the first five to ten days a large proportion of this exudation and infiltration can be removed from the part, before it can undergo organization, by any mechanism which will restore the normal circulatory efficiency of the part." It must be remembered, however, that it is the circulatory efficiency of the venous return that is important in this case. Increase of the arterial circulation alone will result in increased edema and swelling and will therefore be harmful rather than helpful to the removal of tissue exudates. This is the reason that heat should not be used alone in the treatment of fractures but should always be accompanied by massage, elevation or active muscular contraction.

If allowed to progress to completion the organization of blood and tissue fluid culminates in the formation of firm fibrous adhesions which may cause pain, limitation of motion and circulatory impairment. The organization of this fluid into fibrous tissue is concomitant with and analogous to the development of fibrous tissue about the fractured bone ends which results in the formation of bony callus. Therefore it must be treated immediately after the fracture has occurred and not after the fracture has solidified.

Thus the pathologic development may be divided into two stages. The first is the stage of organization in which appropriate treatment may result in removal of the disturbing elements. This stage probably lasts two or three weeks. The second is the stage of scar tissue formation in which fibrous adhesions limit function. Treatment in this stage is slow and laborious and sometimes ends in complete failure. Watson-Jones [3] has aptly said, "edema is glue."

It is my opinion that the greatest single cause of disability in fractures is the presence of persistent swelling during the period of immobilization.

TREATMENT

Treatment for these conditions should be started immediately after the fracture is reduced and immobilized. At first the treatment should be directed mainly toward the removal of hemorrhage and edema. This may be accomplished most efficiently by active exercise. Normal venous return flow circulation from the extremities is accomplished through muscle contraction. By careful choice of the immobilizing apparatus, active motion of some portion of the extremity is usually feasible throughout the period of immobilization. Close fitting, nonpadded plaster casts, trimmed so that motion is possible in all joints except those required to maintain the immobilization, are usually satisfactory in those patients that are ambulatory. Skeletal traction and internal fixation in the more serious cases allow adequate immobilization of the fracture line with minimum immobilization of surrounding joints. The great majority of fractures require only active motion for their physical therapy. In a previous study [4] at the Minneapolis General Hospital out of 3,582 cases of fracture, 986, or 27½ per cent, received formal treatment in the physical therapy department. Thus 72½ per cent were treated by active motion alone. Elevation of the affected part is a useful adjunct in removal of swelling. However, it must be remembered that for elevation to be effective, the extremity must be so arranged that there is a continuous downhill slope from the fingers or toes to the body. This means in the upper extremity that the hand must be above the elbow and the elbow above the shoulder. Obviously this is not a practical position unless the patient is in bed. The use of a sling in a Colles fracture, for instance, does not prevent swelling because an uphill grade is still present between the elbow and the shoulder. If adequate activity or elevation or both can be accomplished immediately after the fracture has been reduced the problem of removal of swelling has usually been solved and routine care in the department of physical medicine will be reduced to a minimum. However, in many cases it is impossible or impractical to achieve sufficient activity in this simple manner. It is most important that persistent swelling or inactivity be detected and the decision for treatment be made as early as possible. During the first two weeks after the injury the greatest amount of benefit can be obtained by the least amount of treatment in the shortest time. Delay in starting treatment means a disproportionately greater delay in recovery of function if firm joint adhesions or muscle atrophy or fibrosis is allowed to supervene. Formal treatment is carried out in the following manner:

Heat.—Heat may be introduced by a multitude of methods. Infra-red lamps, carbon filament bulb bakers, hot soaks, hot packs, paraffin baths, whirlpool baths, bathroom heaters, diathermy, shortwave diathermy, electric pads, the sun's rays, and numerous other sources of heat may be used. The physiologic effects of all these types of heat are the same. Their usefulness varies according to their availability and their penetration of tissues. The physiologic effects of heat briefly are: 1. Heat in mild doses as commonly used in the treatment of fractures is sedative. It relieves the pain and muscle spasm associated with injuries. 2. It increases circulation. This is most pronounced on the arterial circulation. The capillary pressure is greatly enhanced. 3. An increase in swelling results as a consequence of the greater infiltration incident on the higher capillary pressure.

Here then are two desirable effects, relief of pain and increased circulation, and one undesirable effect, increased swelling. If treatment is left at this stage, the pain will return and the circulation again decrease when the effect of the heat has subsided. But the greater swelling will often remain. Too frequently the patient is instructed to soak his fractured extremity in hot water after the cast has been removed without adequate instruction as to the use of massage and exercise following the heat. Under these circumstances if the heat used is effective the patient is just as likely to obtain decreased motion as he is to obtain increased motion.

The advisability of diathermy and shortwave diathermy in the early treatment of fractures is subject to serious question because they are the most efficient methods of applying heat and therefore may cause enough swelling to be harmful.

Massage.—The physiologic effects of massage vary with the type and dosage employed. However, as used in the early treatment of fractures (superficial stroking) the effects are: (1) sedation and relief of pain and muscle spasm; (2) increase of circulation, this time the greatest effect is on the venous side of the circle so that return flow is facilitated both reflexly and mechanically; (3) subsequent decrease of swelling because of the increased venous circulation.

All of these effects are desirable ones and are easily obtainable in skilled and gentle hands. It is dangerous to entrust the early physical therapy of fractures to most masseurs and athletic room rubbers. They are usually big burly men or women who pride themselves on their strength and who firmly believe that massage is not useful unless it hurts. As a matter of fact any treatment given in the early stage of fracture management must be not only free from pain but must relieve pain to be effective, because muscle spasm must be overcome. In addition rough treatment is likely to cause redisplacement of fragments. The objections to massage advanced by such authors as Watson-Jones[3] and Boehler[5] are apparently based on such experiences. The dosage of massage must be exactly controlled and capabilities of the patient must be kept constantly in mind. In my experience massage in the home carried out by the patient or his relatives or friends has been not only woefully inadequate but often definitely harmful, so that I not only do not prescribe home massage, but also strongly discourage it when suggested by others.

[3] Watson-Jones R.: Fractures and Joint Injuries, Baltimore, Williams & Wilkins Company, 1944.

[4] Knapp, M. E.: Role of Physical Therapy in Fractures, Arch. Phys. Therapy 21: 401-407 (July) 1940.

Exercise.—Heat and massage as discussed in the preceding paragraphs are only preparatory to the most important procedure in the physical therapy of fractures, the controlled use of motion. Exercise is usually classified as passive and active. Passive exercise may be subdivided into relaxed motion and forced motion. Active exercise is subdivided into assisted, free and resisted active exercise.

In the early treatment of fractures the use of passive motion is not practical. Theoretically, relaxed passive motion could be used, and it is frequently ordered by surgeons who do not have a close connection with the physical therapy department in which the treatment is given. However, in practice, relaxed motion is rarely obtained early in fractures because of the fear of the patient who voluntarily or involuntarily contracts his muscles in anticipation of the motion to follow. Thus the passive motion is converted into resisted motion with the patient doing the resisting. Under these conditions displacement of the fragments is to be expected.

Active exercise is the practical method in early fractures. If adequate immobilization can be obtained by tight-fitting plaster casts or internal fixation, free active or even resisted active motion may be used especially by the performance of ordinary daily tasks that do not require great strength or heavy lifting. When it is desired to move joints in close proximity to the fracture line, assisted active motion should be used. The technician supports the part to eliminate gravity and the patient carries out the motion within the limits of pain. Under these conditions the patient will stop the motion at the earliest sign of pain and there is little danger of disturbing the fragments. Only the range of motion that is possible without pain is allowable.

The physiologic effects of active exercise are: (1) hypertrophy of muscle fibers; (2.) increased circulation, both arterial and venous; (3.) decreased swelling, and (4.) increase of strength and nutrition.

Wherever voluntary active motion may be impractical or impossible, as in nerve injuries, the use of electrical stimulation will help to prevent muscle atrophy and circulatory dysfunction. The faradic current may be used if the nerve is intact, but the interrupted galvanic or sinusoidal current must be used if the nerve is severed and the nerve endings are degenerated.

Active motion of all joints not necessarily immobilized must be insisted on between treatments throughout the course of fixation if muscle atrophy and fibrosis are to be prevented and limitation of motion is to be kept at a minimum.

General Treatment.—Since the advent of World War II increasing stress has been laid on the fact that the recovery of an injured patient depends not only on the recovery of the local injury but also on the maintenance of activity throughout the patient's body. This type of physical therapy or rehabilitation is started as early as practical, preferably immediately after the fracture has been reduced, and consists primarily of exercises designed to maintain activity, muscle tonus and muscle power in those parts of the body not concerned with the immediate injury. Exercises have been designed for all portions of the body and are performed in the service hospitals under the direction of physical education specialists. The exercises are carried out preferably in groups so that a number of men are doing the same thing at the same time. This produces a sense of competition as well as rhythm, which makes the exercises more enjoyable. Even the most severely injured patient can move some muscle, though it may be only his eyelids. The Army Air Forces have prepared several useful booklets to aid the injured soldier in recovering from his mental as well as his physical disability. These pamphlets present the problem in an interesting manner and provide charts by which the patient can follow his progress from day to day. They seem to be well adapted to the rehabilitation of large groups of injured persons who have similar backgrounds or ambitions as is the case in the armed services. These rehabilitation exercises are important, not only for the physical effects produced but also for the psychologic effects. They tend to keep the patient cognizant of the fact that he is not totally disabled, that he can carry out motions which are useful and that he will be allowed to carry on useful activities as soon as that is possible. Thus there is a logical progression of these rehabilitation exercises to the more specific types of occupational therapy which are of value in the healing stages.

OCCUPATIONAL THERAPY

Occupational therapy is so closely linked to physical therapy that there can be no absolute dividing line between them. This has become more obvious in recent years, so that the present designation of physical medicine includes both physical and occupational therapy plus the diagnostic procedures necessary for the intelligent use of both. Occupational therapy is the logical link between physical therapy and return to ordinary working conditions. It naturally divides itself into the recreational and vocational types. Occupational therapy was started as an attempt to divert the patient's mind while he was forced to remain in bed and relatively inactive. Basket weaving, knitting, sewing, leather working and artistic pursuits were suitable for this purpose. Later the adaptation of occupational devices to the treatment of involved portions of the body was employed. Special technics were used to strengthen muscles and mobilize joints by attaching grips to looms and using treadle-powered lathes and saws with devices to enable the patient to use the desired muscles and joints.

Carpentry is most adaptable to this type of treatment, so that most occupational therapy departments include well equipped carpentry shops. Here the ordinary use of tools with which most men are familiar is modified to allow treatment of special muscles or to aid in the mobilization of joints. If a patient's fingers are stiffened it may be necessary to build up the handles of the tools to allow him to grip them firmly. Screw drivers aid in restoring pronation and supination. Hammers aid flexion and extension of the wrist, and saws aid flexion

---

5. Boehler, L.: The Treatment of Fractures, Baltimore, William Wood and Company, 1935.

and extension of the elbow and shoulder. Leg and foot motions are obtained by using bicycle type foot power or treadle power machines with adaptations to fit the disability of the individual patient. Looms for weaving various materials have shuttles and controls which are adjustable to the patient's disabilities. Tinsmithing, lathe work, sewing, clay modeling and similar occupations are used in the same way. These methods have accomplished their purposes fairly well but have had no connection with the patient's previous occupation or future capabilities. Many of the methods are not acceptable to men because they do not consider them to be masculine occupations.

Vocational occupational therapy is a considered attempt to have the patient use therapeutically the motions which are employed in his ordinary occupation, or if that is impossible because of severe injury, to teach him another occupation in which those movements may be useful. Typical examples are the clinic of the Workmen's Compensation Board in Toronto under the direction of Dr. Harold Storms and the rehabilitation clinic of the Liberty Mutual Insurance Company in Boston. At such centers the patient is put to doing his usual work with adaptations to benefit his disability. He is not discharged until he is able to perform work useful from an economic point of view. For instance, a bricklayer is put to work laying bricks. At first he may only pick them up to move them from place to place. The movements are gradually increased in number and complexity until he is able to lay bricks fast enough to make him available for useful employment. It is not difficult to get him to return to work when he knows that he is able to do a full day's labor. A laborer may be put to work shoveling gravel. The same principles are used in other occupations.

Storms[6] has listed the following principles:

1. Therapy should not be fixed or inviolate but in a constant state of change, ready to absorb new forms or modifications of old to suit an ever new set of conditions.
2. Therapy should be aimed not only at an increased range of movement in stiff joints, abolition of pain and reeducation of muscles, but also at an increase in muscle power to that needed by the workman when he renews his employment.
3. The injured workman is not a mental patient. He is keen to get back to work and what is necessary is to build up muscle strength and limber the joints. While there are occasional cases of loss of morale or even of malingering, these are in the minority and are handled by the therapists in their stride.
4. The best form of work therapy is exercise with the tools to which the patient is accustomed. This has a three-fold advantage: 1. The patient does not have to learn a new technic. 2. The proper muscle groups are exercised. 3. The patient is able himself to note his progress and to help decide on his fitness for work.
5. There should be a physical therapy and an occupational therapy department, with cooperation between the aides of the two departments.

Griffiths has advanced the same ideas in his observations on the conditioned reflexes of industry which are so complex that the use of the workman's own tools is required for the best results.

While recreational therapy is useful when the patient is in bed and has a limited usefulness during early convalescence, vocational methods appear to be much more valuable when the patient is in the later convalescent stages. The tendency at the present time is to emphasize the vocational methods and to deemphasize recreational occupational therapy.

SUMMARY

Physical medicine is not a substitute for reduction in fractures. Treatment must be started early, that is, during the period of immobilization, for best results. Persistent swelling is the most frequent cause of disability following fractures. Active motion is the most effective treatment for this swelling. Physical therapy and occupational therapy should be combined for the most effective therapy for postfracture disabilities.

PANEL DISCUSSION

TILTED PELVIS

QUESTION: In our town we have an active osteopathic society with a roentgenologist, and there is a consequent thought prevalent that patients have a "tilted pelvis." My question is, in your opinion how frequent is the condition of a "tilted pelvis" and how often is it the cause of backache?

DR. OBER: Seventy-five per cent of the old lame backs that I have seen in the last year, some of them existing as much as twenty-five years, are due to tilted pelvis; it is common, and it is due usually to a short leg or an inequality between the ilium and the femur. A lift under the heel until the patient's spine is leveled will cure most lame backs. I received $5,000 from a gentleman once who had spent thousands of dollars on his back. He said, "Never mind. Common sense is worth a lot of money."

PHYSICAL MEDICINE IN OSTEOARTHRITIS

QUESTION: Is physical medicine as useful in osteoarthritis as it is in rheumatoid arthritis? Should exercise be stressed in the treatment of osteoarthritis?

DR. SOLOMON: Physical therapy is used for all forms of arthritis. Time did not permit differentiating the various forms. I stress this matter of the exercises for the patient with rheumatoid arthritis because it seems to be more important. There is this difference, though: In rheumatoid arthritis and in osteoarthritis the pathologic changes are different. In osteoarthritis or hypertrophic arthritis, there is no danger of deformity or contours. Most of the patients will benefit from the ordinary exercises which they get themselves. Sometimes I will tell these persons to rest their knee or their back, and they will be helped. Some of these patients are inclined to want to exercise a great deal because they believe it will prevent stiffness. Patients with hyperthrophic arthritis are cautioned particularly in that regard.

QUESTION: Is galvanic current indicated to reduce swelling with severe ichthyosis?

DR. CIPOLLARO: I have never used it. I think maybe you can answer that question, Dr. Krusen.

DR. KRUSEN: I do not believe that it is.

DR. KNAPP: In my opinion, that is not a useful method.

DR. SOLOMON: I certainly agree with what you say, Dr. Krusen. I think there are simpler methods to do it, and why go to that difficulty?

HERNIATION OF INTRAVERTEBRAL DISK

QUESTION: How often is pain in the back due to herniation of the intervertebral disk?

DR. OBER: Not very often. The Greek literature would lead one to think that every backache was due to a ruptured disk. If that is so, then every headache is due to a brain tumor. The point is that the neurologist sees these patients, and he says that the pain is all due to ruptured disks. As a matter of fact, there are millions of patients with lame backs who get well without any treatment, and there are others who get well with treatment by their own family physician. Then when the family physician does not succeed, they go to the orthopedic surgeon, and he cures most of those persons. The few that are left have herniated disks. I would say that about one hundredth of 1 per cent of all lame backs might come in the disk syndrome.

SUCTION-PRESSURE FOR PERIPHERAL VASCULAR DISEASE

QUESTION: What has been your experiense as to the value of the suction-pressure apparatus in peripheral arterial obstruction?

DR. MCCLELLAN: I believe that the suction-pressure apparatus has little place today in the treatment of peripheral vascular disease. There may be a few isolated cases in which the obstruction is sufficient to warrant its use. I think that if one watches the clinics where this has been in use, one will find most of the apparatuses are covered with dust and are in the storeroom.

---

[6] Storms, H. D.: Rehabilitation of Convalescent Industrial Casualties with Physical Medicine, Arch. Phys. Therapy 25: 469 (Aug.) 1944.

Dr. Ober: In the March 1 number of The Journal is a small article on histidine (Wirtschafter, Z. T., and Widmann, R.: Elaboration of Histamine in Vivo, J. A. M. A. 133:604 (March 1) 1947). There has been a remarkable result from the use of histidine and the use of large doses of ascorbic acid in getting rid of gangrene of the lower extremities due to arterial occlusion. It is probably useful in Bürger's disease and other similar diseases.

DIATHERMY IN PRESENCE OF METALLIC INTERNAL FIXATION

Question: Is diathermy contraindicated in the presence of metallic internal fixation?

Dr. Knapp: That question is one which always comes up. In my opinion, diathermy is not contraindicated in the presence of metallic internal fixation, for this reason: If metal is on the skin surface there is a great difference in conductivity between the metal and the air and the skin, so the greater part of the energy is warped into the metal and burns may occur. When that metal is buried in a liquid, which is a conductor also, then the difference is not great in conductivity, so that there is not a warping of the field into the metal. Associates and I have used diathermy many times with metal which is entirely within the body, and we have never seen any harm from it.

EXERCISE FOR BACKACHE DUE TO OSTEOARTHRITIS

Question: Is osteoarthritis a contraindication to the use of exercise when the backache is attributed to this cause?

Dr. Ober: The exercise should never be used when the back is painful. There are many persons who have spurs ½ inch (1.3 cm.) long, some of them looking like ice tongs, who never had a lame back in their lives. So, these patients' lame backs are really not due to the osteoarthritis; they are due to their disturbed physiology, because they get over their lame backs. The time for exercise in lame backs is the time between attacks. Get the muscles restored so that another attack is avoided. It is all very well to treat lame backs as soon as the pain disappears and to get the patients going, but that does not accomplish anything, because they go out and hurt their backs again. However, arthritis is no contraindication for exercise.

GRADED EXERCISES FOR CHRONIC MYOCARDITIS

Question: Will you please discuss graded exercises for chronic myocarditis?

Dr. McClellan: Graded exercises from the flat walk to a mild degree of incline have a distinct place for these patients. Graded exercises, however, should be controlled definitely by clinical observation of the patient, the response of his heart to this exercise from his pulse rate and other indications. They should be limited in distance, and they should be increased gradually as the patient's ability to perform the exercises increases.

MANIPULATION FOR BACKACHE

Question: Do you consider manipulation of any value in treatment of backache?

Dr. Ober: I manipulated one back once, and I swore that I would never do another. All that the osteopath does is to stretch out the muscle, and there are other ways of doing it. He never cures anything. I never manipulate a lame back.

SACROILIAC STRAIN

Question: What is the underlying mechanism of the so-called acute sacroiliac strain?

Dr. Ober: That has been overrated. Sacroiliac strain has practically gone out the window. Usually sacroiliac strain occurs in fat people who have large abdomens or some twist. Most sacroiliac strains come from severe injuries. They are uncommon. They are seen after pregnancy when the pelvis has not retracted, by the shortening of the ligaments after the change in the hormone content of the mother.

MECHANICAL STRETCHING FOR CONTRACTURE OF FASCIA LATA

Question: Do you think mechanical stretching can replace surgical sectioning of the fascia lata in backache due to contracture of the fascia lata?

Dr. Ober: In most instances, yes. Rarely is it necessary to divide the fascia lata, and I do not do it nearly so often as some of my colleagues.

NAUHEIM BATHS FOR HYPERTENSION

Question: Is chronic hypertension a contraindication to the use of Nauheim baths?

Dr. McClellan: No. It is not a contraindication. The use of the Nauheim bath for that group is of value in the general influence on the body as a whole, in steadying and reducing nervous tension, which is certainly one of the major factors in many cases of hypertension. The Nauheim bath is indicated for the patient with severe hypertension who has disability and is perhaps confined to bed because of it. As I said, in the milder essential hypertensions something can be accomplished by its use.

DANGERS OF EPILATION

Question: What are the dangers of epilation? Should patients be sent to beauty specialists for removal of superfluous hairs?

Dr. Cipollaro: Unfortunately, in many communities there are no dermatologists who can do this work adequately. There are no objections to having a lay person do the work, provided that he has been properly trained and provided that he works under the supervision of a physician. In communities where there are adequate dermatologic facilities those patients should be referred to the dermatologist for treatment.

DIATHERMY FOR FRACTURES

Question: Is diathermy contraindicated in the after-treatment of fractures?

Dr. Knapp: I feel that diathermy is contraindicated in the early treatment of fractures. That is, diathermy is the most efficient method of producing heat and therefore is also the most efficient method of producing hyperemia. At least that is what is believed at the present time. It is more likely to cause decalcification than calcification. So, I restrict the use of diathermy until after union has occurred so that nonunion will not be caused by the use of diathermy.

HISTAMINE PHOSPHATE ION TRANSFER

Question: *Describe your technic of using histamine phosphate ion transfer.*

Dr. Ober: A small battery is furnished for that purpose. It has a little resistance coil in it. The handle is held in the patient's hand, which is covered with a wet cloth. The wet cloth is placed over the electrode, and this is placed on the back in the region of the muscle spasm. Then it is left on for about three minutes. It covers the whole area of muscle spasm perhaps in two or three or four applications. There is produced a hyperemia that looks like the hives. Some persons are sensitive to histamine, and occasionally a severe attack of hives occurs that may last for several weeks. So, one must be sure that the patient is not allergic nor has allergic manifestation of other sorts. If he has, one should not use the histamine locally.

REST IN MANAGEMENT OF RHEUMATIC ARTHRITIS

Question: Please discuss the place of rest in the management of rheumatic arthritis.

Dr. Solomon: Many persons ask whether one should put one's patients to bed. As I said, I do not. That might be the easiest way to answer that. I think rest certainly is indicated for these persons, but rest may be given along with exercises. They can rest for an hour in the morning and again for an hour in the afternoon. They can rest even more times during the day. But to tell a patient definitely to go to bed I think does him more harm than good.

Veterans.—One of every 10 persons in the United States is a veteran of World War II; about 2 of every 3 men between the ages of 20 and 35 are World War II veterans. By 1952, veterans and their families will number an estimated 62,300,000—or 43 per cent of the nation's population. There were more than 109,000 patients hospitalized by the Veterans Administration on March 1.—Veterans Administration Information Service, April 22, 1948.

RADICAL RESECTION OF HEAD OF PANCREAS AND TOTAL PANCREATECTOMY

JOHN M. WAUGH, M.D.
Rochester, Minn.

Exactly fifty years ago the first recorded successful attempt was made to remove a carcinoma of the ampulla of Vater by radical resection. After this operation by Halsted[1] only sporadic attempts at radical resection were made, most of them being unsuccessful. Then, in 1935, Whipple, Parsons and Mullins[2] devised a technic for operation in two stages which could be undertaken as a curative and not a palliative measure. The advent of vitamin K permitted one stage radical resection to be executed with less risk than had accompanied certain palliative procedures before this means of correction of deficiency of prothrombin was available. The important observations made by Dragstedt[3] concerning the physiology of the pancreas and the surgical accomplishments of Brunschwig,[4] Crile,[5] Trimble and his associates,[6] Hunt,[7] Pearse,[8] Cattell,[9] Orr[10] and others soon gave the members of the profession confidence in the procedure.

These contributions so stimulated the members of the surgical profession that with each ensuing year there have appeared more numerous reports of successful radical resection of the pancreas and duodenum, not only for malignant disease of the ampulla of Vater, head of the pancreas, duodenum and stomach, but also for benign conditions such as pancreatitis and tumor of the islands of Langerhans.

It would seem that the time is near when an attempt should be made to evaluate the results. It is hoped that this analysis will stimulate other surgeons with a considerable experience to review similar operations performed by them, so that from the combined experience of all it can be determined when these formidable resections should or should not be undertaken.

SURVEY OF CASES AT MAYO CLINIC

In the following review are included all cases in which radical resection of the head of the pancreas and the duodenum was attempted at the Mayo Clinic up to Jan. 1, 1947 (table 1). In all, 49 patients underwent a modified Whipple operation. There were 13 deaths in the hospital, or an operative mortality rate of 26 per cent. Six patients underwent total pancreatectomy[11] 1 died. Forty-three underwent radical resection of the head of the pancreas and the duodenum; 12 of them died in the hospital, an operative mortality rate of 28 per cent.

TABLE 1.—*Radical Partial and Total Pancreatectomy for Benign and Malignant Disease: All Cases at Mayo Clinic to Jan. 1, 1947*

Operation	Patients	Hospital Deaths	
		Number	Percentage
Excision of head of pancreas and duodenum	43	12	28
Total pancreatectomy	6	1	17
	—	—	—
Total	49	13	26

A likely explanation for the lower mortality rate which accompanies total pancreatectomy is that (1) removal of the body and tail of the pancreas and the spleen adds little to the procedure of removal of the head of the pancreas and the duodenum, and (2) because the entire pancreas is excised, any leakage or fistula from the pancreatic stump is obviated. This does not indicate, however, that total pancreatectomy should be performed in preference to partial pancreatectomy when the latter will eradicate the disease, since the metabolic derangements which will follow total excision may outweigh any possible advantages of the more radical operation.

TABLE 2.—*Radical Excision of Head of Pancreas and Total Pancreatectomy for Benign Disease*

Condition	Operation	Patients	Hospital Deaths	
			Number	Percentage
Islet cell tumor of head of pancreas	Total pancreatectomy	3	1	33.3
Chronic pancreatitis with calcification and intractable pain	Total pancreatectomy	2	0	0
	Excision of head of pancreas and duodenum	6	4	66.7
		—		
		8	4	50
Total operations for benign lesions		11	5	45

Although only 11 patients have been operated on for benign disease of the pancreas, it is interesting to note (table 2) that the operative mortality rate for such an operation is more than twice that of pancreatectomy done for malignant disease (table 3). This is probably due to the greater technical difficulties that may arise when the surgeon is confronted with an inflammatory process that frequently becomes adherent to the superior mesenteric vein and may result in gross operative hemorrhage, such as happened in 2 instances among the 8 persons operated on for chronic pancreatitis. The other 2 deaths resulted from peritonitis and massive pulmonary embolism, respectively. The fact that there were no deaths in the hospital after total pancreatectomy for chronic pancreatitis would bear out the point that it is exceedingly important to defer resection of a part or all of the pancreas for inflammatory conditions until the process is in the chronic end stage of calcification—as it was in all the successful resections—and not

to attempt pancreatectomy in the face of subacute inflammation.

INDICATIONS FOR PANCREATECTOMY

Naturally, all conservative measures, such as prolonged drainage of the common bile duct either by insertion of a T tube or by choledochoduodenostomy, should be tried before resection is attempted. If these measures fail and the process of calcification is limited to the head of the pancreas and the pain is intractable, resection of the head of the pancreas should be undertaken. If, however, the calcification involves the entire pancreas, the pain remains intractable and there are associated diabetes and insufficiency of the external secretion, then total pancreatectomy is advisable. Already there are encouraging reports of relief obtained for patients with this type of pancreatitis by performance of thoracicolumbar sympathectomy alone or this type of operation associated with vagotomy. It is hoped that the late results will be satisfactory, since such procedures can be done with only a fraction of the risk of pancreatectomy.

TABLE 3.—*Radical Partial Pancreatectomy for Carcinoma: Operative Mortality**

		Hospital Deaths					
Site of Lesion	Operation in	Patients		Number		Percentage	
Head of pancreas	One stage	15		2		13	
	Two stages	4		1		25	
		—	19	—	3	—	16
Ampulla or papilla of Vater	One stage	13		3		23	
	Two stages	3		1		33	
		—	16	—	4	—	25
Duodenum and stomach	One stage		3		1		33
			—		—		—
Total			38		8		21

* Thirty-seven patients underwent radical excision of head of pancreas; 1 patient underwent total pancreatectomy.

Occasionally, total pancreatectomy will be necessary for islet cell tumor. Total pancreatectomy has been performed three times at the Mayo Clinic among a total of 46 patients in whom islet cell tumors were found at surgical exploration during the past twenty years (table 2).

Before a patient undergoes total pancreatectomy for islet cell tumor of the head of the pancreas, it is imperative to determine (1) that the patient's symptoms are due to spontaneous hypoglycemia, (2) that the tumor is not situated in the tail or body of the pancreas, where about 80 per cent of such tumors are found, or in an accessory pancreas, (3) that if the tumor is situated in the head, local excision with preservation of the pancreas is not possible or that resection of the head of the pancreas, which would obviate diabetes and deficiency of external pancreatic secretion, is not possible and (4) that the symptoms and disability produced by the tumor outweigh the magnitude of the operation and the disturbance in metabolism which follows it.

If, after careful surgical exploration, a tumor is not palpable, it is usually advisable for the surgeon to resect the tail and body of the organ and, if on immediate careful examination of this specimen by the pathologist no tumor is found, the surgeon ought then to proceed with removal of the head of the pancreas.

DATA ON OPERATION FOR MALIGNANT LESIONS

A total of 38 patients underwent operation for malignant processes (table 3). For 37 of these radical resection of the head of the pancreas and the duodenum was performed, and for 1 patient total pancreatectomy was done. There were 8 deaths in the hospital, an operative mortality rate of 21 per cent. Among those patients who had malignant lesions, 19 had carcinoma of the head of the pancreas, 16 had carcinoma of the ampulla or papilla, 2 had carcinoma of the duodenum and 1 had extension of the malignant process into the head of the pancreas from a primary carcinoma of the stomach. It is pertinent and significant that 15 patients underwent operation in one stage for carcinoma of the head of the pancreas, with an operative mortality rate of 13 per cent. This figure is near that for palliative operations at the present time. The operative mortality rate for lesions of the ampulla of Vater was 23 per cent in the case of 13 patients who underwent a one stage operation. This is appreciably higher than the operative mortality rate among those who had carcinoma of the head of the pancreas. Actually, there should not be this difference in risk, and as the series becomes larger the discrepancy between the operative risk of lesions of the ampulla and that of lesions of the head of the pancreas will become less.

FOLLOW-UP STUDY ON THIRTY PATIENTS

For the purpose of evaluation of survival beyond the immediate postoperative period, the group of 30 patients who had had a malignant lesion as reported by Clagett and me,[12] and all operated on prior to Jan. 1, 1946, were examined or reached by letter by March 1, 1947.

In table 4 is a total of 24 patients who survived operation; 15 had died in the interim from recurrence, and 9 were living without definite evidence of carcinoma at the time the inquiry was made. The survival rate among those patients who had had carcinoma of the head of the pancreas is discouraging, for 11 of the 14 surviving the operation already had succumbed at the time of inquiry. The average length of palliation for this group was 8.4 months (table 5). It is doubtful that palliation of greater duration was obtained from radical resection than might have been expected from cholecystogastrostomy or cholecystojejunostomy. The 3 patients still alive at the time of this inquiry had lived, on the average, eighteen months (table 6), and 2 of them had had involvement of lymph nodes. This is heartening, for at present radical resection offers the only hope of cure for these unfortunate patients, and because of the location of the pancreas the most radical type of resection possible is at most, so far as the node-bearing area is concerned, local excision.

TABLE 4.—*Survival of Patients, After Radical Partial Pancreatectomy for Carcinoma, Operated on Prior to Jan. 1, 1946**

Site of Carcinoma	Patients	Postoperative Deaths	Patients Surviving Operation	Deaths Due to Recurrence†	Patients Living
Head of pancreas	16	2	14	11	3
Ampulla of Vater	11	3	8	3	5
Duodenum	2	1	1	0	1
Stomach	1	0	1	1	0
	—	—	—	—	—
Total	30	6	24	15	9

* All thirty patients were traced.

† All deaths after dismissal were considered to be due to recurrence.

The survival rate of patients after resection for carcinoma of the ampulla of Vater is, as might be expected, immeasurably better than that after resection for carcinoma of the head of the pancreas. Of 8 surviving operation for the former lesion, 3 succumbed because of recurrence (table 4) and 5 had been alive for an

average of twenty-eight months at the time of this report (table 6). One of these was alive and well three years after operation. Those who obtained only palliation survived an average of thirteen months (table 5). It would appear that some of the patients who had carcinoma of the ampulla will secure permanent cure.

TABLE 5.—*Survival Period of Those Patients Who Obtained only Palliation**

Site of Carcinoma	Patients	Postoperative Survival Period, Months				Average Survival Months
		1-5	6-11	12-17	18-24	
Head of pancreas.....	11	3	6	1	1	8.4
Ampulla of Vater.....	3	1	..	1	1	13
Stomach.............	1	1	..	..	..	4
Total...............	15	5	6	2	2	9

* All patients were operated on prior to Jan. 1, 1946.

TABLE 6.—*Survival Period of Those Patients Alive in March 1947, Without Evidence of Recurrence*

Site of Carcinoma	Patients	Months After Operation				Average Survival, Months
		12-17	18-23	24-29	30-36	
Head of pancreas......	3	1	2	..	..	18
Ampulla of Vater......	5	1	..	1	3	28
Duodenum.............	1	..	1	..	..	22
Total................	9	2	3	1	3	24

Although the results thus far recorded for the group with carcinoma of the head of the pancreas are discouraging, there is no other procedure which offers any hope of cure; hence, I feel that radical resection is justifiable and indicated for carcinoma arising in the ampulla of Vater or head of the pancreas. Furthermore, at the time of operation the surgeon may not be able to determine whether the lesion arises in the ampulla of Vater, head of the pancreas or duodenum. Even after resection, the pathologist may have difficulty in establishing the origin of the lesion.

It is obvious, then, that to give every patient his rightful opportunity for cure rather than only palliation, the surgeon will of necessity resect every lesion possible, hoping that it will prove to be a lesion of the ampulla of Vater. Naturally, the earlier in the course of the disease these patients are operated on, the better the chance of cure will be.

Jaundice should be considered an indication for surgical exploration unless incontrovertible evidence is at hand to justify medical management. The fact that the jaundice disappears spontaneously or is intermittent or mild is no sign that it is of benign origin. Several patients in our series had intermittent jaundice in the presence of carcinoma of the ampulla of Vater, and in 1 instance recently jaundice had entirely resolved after its first appearance.

The Whipple procedure, or a modification of it, also provides a curative operation for primary carcinoma of the duodenum. One patient who survived this operation in the present series was alive, well and active twenty-two months postoperatively (table 6).

So far as the mortality rate is concerned, the one stage operation in our experience has produced a lower figure (table 3). Most patients will present themselves in reasonably good condition, so that with the accepted preoperative preparation the single stage operation certainly will be associated with no increased hazard. The one stage procedure has the advantages of eradication of the malignant process at an earlier date, and the patient is spared the discomfort and expense of two major operative procedures. The single operation also usually permits an easier and more rapidly executed resection. Certain patients, however, are in such poor condition when they come for treatment that performance of a two stage procedure is obligatory. By careful preoperative analysis the condition of such patients, as a rule, can be determined with little difficulty.

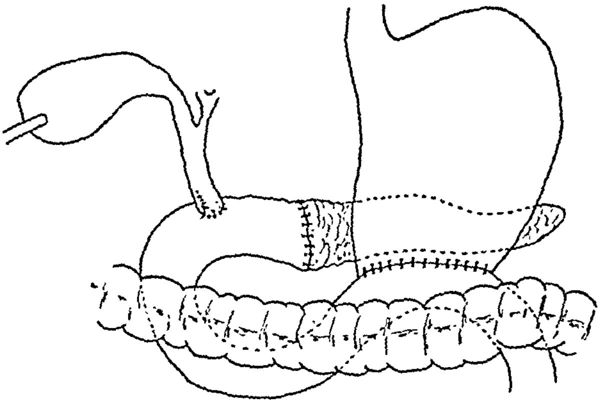

Fig. 1.—Technic for restoration of continuity of the gastrointestinal tract, biliary and pancreatic ducts after resection of the duodenum and head of pancreas (end to end pancreaticojejunostomy, end to side choledochojejunostomy, end to side postcolic, antiperistaltic gastrojejunostomy). (From Waugh.[13])

In an analysis [12] of the first 30 cases of radical resection of the head of the pancreas and duodenum at the Mayo Clinic, various methods of drainage of the biliary and pancreatic ducts and restoration of gastrointestinal continuity were compared. Conclusions were reached which it has not been necessary to change with further experience. Performance of end to end pancreaticojejunostomy, end to side choledochojejunostomy and end to side, postcolic, antiperistaltic gastrojejunostomy has proved to be satisfactory and seems physiologically and anatomically sound (fig. 1). This technic more or less isolates the biliary and pancreatic systems, so that food and the gastric secretions are shunted distally. This isolation may prevent cholangitis. Furthermore, if a malignant lesion should recur, it would not be likely to obstruct the gastroenteric stoma.[13] The technic of

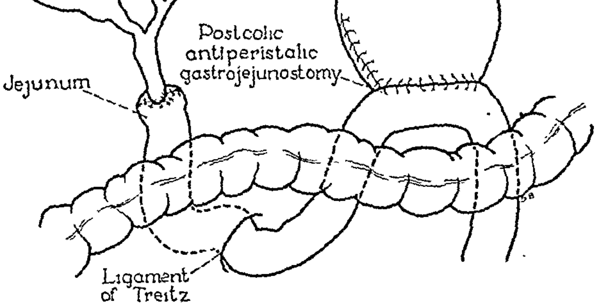

Fig. 2.—Technic for restoration of continuity of the gastrointestinal tract and biliary ducts after total pancreatectomy (end to end choledochojejunostomy, end to side postcolic, antiperistaltic gastrojejunostomy).

total pancreatectomy, as far as revision of the gastrointestinal tract is concerned, is the same, but end to end choledochojejunostomy is utilized since no pancreatic stump remains which requires drainage into the jejunum (fig. 2)

SUMMARY

Radical resection of the head of the pancreas and of the duodenum had been done forty-nine times at the Mayo Clinic up to Jan. 1, 1947. Eleven operations were for benign disease and thirty-eight for malignant lesions. Six patients underwent total pancreatectomy, with 1 death in the hospital. The indications for resection of the head of the pancreas and total pancreatectomy for benign disease are discussed, and it is emphasized that in such instances resection should be carried out only after careful evaluation of both the operative risk entailed and the disturbances in metabolism which might be expected. Resection for carcinoma was accompanied by an operative mortality rate of 21 per cent. In the future this figure should become lower, for already one stage resection for carcinoma of the head of the pancreas has been performed fifteen times with a hospital mortality rate of only 13 per cent.

A follow-up study of the 30 patients who had undergone resection for malignant processes prior to Jan. 1, 1946, and had survived operation, showed that 3 of 14 who had had carcinoma of the head of the pancreas and 5 of 8 who had had carcinoma of the ampulla of Vater were still alive, averaging 2 years after operation. When it is considered that, other than surgical treatment, there is no therapeutic measure available which gives these patients any chance for cure, one should constantly strive to lower the operative mortality rate for the procedure and improve diagnostic acumen, so that resection can be carried out more often while the carcinoma is still in a curative stage.

ABSTRACT OF DISCUSSION

Dr. Allen O. Whipple, New York: Radical surgical treatment of otherwise fatal cancer of the ampullary area and of the pancreas has now been going on for a period of twelve years. The procedure based on the removal en bloc of the head of the pancreas, the duodenum and the lower end of the common duct is common to all the modifications in the one and two stage operations that have been developed by a number of surgeons during this period. It is now generally agreed that with the transfusion therapy before, during and after operation to maintain blood volume, and the preoperative use of vitamin K and the nonabsorbable suture technic during the operation, that the one stage procedure is an easier and safer one than the two stage operation. The statistics reported from the Mayo Clinic, from the Presbyterian Hospital in New York and from the Billings Hospital in Chicago bear out this statement. It is logical that the radical operation for carcinoma of the ampulla should give better follow-up results than the radical procedures for cancers of the head of the pancreas. The type of carcinoma occurring in the ampulla is more apt to be of the fungating variety than the infiltrative types seen in the head of the pancreas. The early warning signal of jaundice is much more common in the cancer of the ampulla than in cancer of the head of the pancreas, where the growth may begin at some distance from the common duct, retarding the appearance of jaundice and lengthening the time for metastasis to lymph nodes and liver. One feature which is seen in many of these radical resections is the varying extent of the portion at the head of the pancreas spoken of as the lingula, which in some cases surrounds the superior mesenteric vessels and the portal vein, increasing the difficulties of separating the pancreas from these vascular structures. It is at times exceedingly difficult to tell by palpation whether the growth is removable when the head of the pancreas and the duodenum are mobilized and found to be freely movable. A method which Dr. Waugh has recommended is to begin the resection of the antrum of the stomach and common duct before dividing the duodenal jejunal junction of the jejunum distal to that area. There have been few, if any, five year arrests reported with these radical procedures. The only one in my experience has been for six years, but this patient in her last follow-up visit showed evidence of metastasis to the liver. On the other hand, it must be granted that many of these patients live for periods of one or two years free of jaundice and are given an extension of life which they would not otherwise have. The secret of success in obtaining the five year results with patients with these lesions is dependent entirely on early diagnosis, before the patient has gone for periods of weeks or months with increasing jaundice, and in this respect the internist and general practitioner can do more than any one else, referring suspected cases for surgical therapy.

Dr. Richard B. Cattell, Boston: Dr. Waugh has presented a large experience which he and his associates have had during these past three and one half years. I should like to confine my remarks to the resections for malignant disease, commenting on a series of cases which my associates and I have had in our clinic. He reported 38 patients who had resection of the head of the pancreas and duodenum for malignant disease, and during a somewhat longer period of time—since August 1942—we have had forty-four resections. The most important thing to appreciate, which has been brought out by Dr. Walters, Dr. Waugh and Dr. Whipple, has to do with the establishment of the diagnosis even in the early cases that have been explored. Unless one is able to demonstrate at operation that there is dilatation of the biliary tract and, in most cases, dilatation of the pancreatic duct which is readily palpable by digital examination, a malignant growth is not present. In most of these favorable cases from our experience, resection must be done without a positive biopsy, so that we must have these operative findings and, in most cases, the advantage of having a palpable tumor. How may one, then, determine operability in these cases? I am sure that all who are interested in this problem have been guilty of resecting lesions that should not have been resected, because resections of extensive lesions have given very bad results. Let us take, then, three contraindications to operation: (1) distant spread—and it may be possible to do a biopsy; (2) local extension—I should like to exclude those—and (3) involvement of either the portal vein or the superior mesentery vessels. If we exclude these, in 20 to 30 per cent of the cases of obstructive jaundice due to cancer resection should be done. Whipple and Waugh have both said that they feel a one stage operation should now be done with all the adjuncts that there are to resection. I should like to sound a warning relative to doing all of these cases in one stage. If the liver is very large with pronounced distention of the biliary tract, it seems to me that a one stage procedure for decompression of the liver does not complicate the second procedure and may well be advantageous to employ. Such a procedure can be easily and quickly done by a duodenojejunostomy to the full width of the gallbladder. When palliative resections are not sufficiently justified, three things can be done for palliation: the obstruction in the biliary tract can be relieved, the pancreatic obstruction can be relieved and the major blood supply that goes to the tumor can be tied up.

A Critical Caloric Value.—Our observations on protein-depleted animals are in agreement with those cited on patients and growing animals. Thus there is a restriction in the utilization of a constant quantity of protein when the caloric intake falls below a critical value of about 1,240 Cal. per square meter per day. Furthermore, elevation of the caloric intake above this level does not increase the effectiveness of the dietary protein for the synthesis of new tissue. Benditt, E. P., and others, *Journal of Laboratory and Clinical Medicine*, March 1948.

Clinical Notes, Suggestions and New Instruments

HEMORRHAGIC DIATHESIS IN HIROSHIMA, NAGASAKI AND AT BIKINI ATOMIC BOMB TEST

ALFRED L. COPLEY, M.D.
New York

In three recent articles Warren and Draeger,[1] Warren[2] and Draeger and Warren[3] respectively described the occurrence of petechial hemorrhages and thrombopenia in the victims of Hiroshima and Nagasaki and in the animals which were tested at Bikini. Allen and Jacobson[4] found that hyperheparinemia and hemorrhagic manifestations occurred in animals after acute exposure of the whole body to high ionizing irradiations in the midlethal range. The increase of heparin in the circulation, thrombopenia and petechiae were the outstanding abnormalities noted in irradiated dogs.

Copley and Robb[5] have demonstrated that heparin produces thrombopenia in vivo and a decrease of single platelets in vitro. Copley and Houlihan[6] were able to explain this by showing that isolated platelets are agglutinated when incubated with heparin plasma. Thus heparin, although highly active as an anticoagulant, not only does not inhibit platelet agglutination, but induces it. This accounts for the thrombopenia.

The occurrence of petechial hemorrhage following injection of heparin was observed by Chambers and Zweifach[7] in their extensive studies on hemorrhage and hemorrhagic shock, and by Copley and Lalich[8] in their studies on hemostasis in mice. The appearance of petechial hemorrhage following injection of heparin in the nictitating membrane was recently reported by Chambers and Copley.[9] In still unpublished findings my assistant, Mr. George Kozam, and I have found the constant occurrence of white emboli in the nictitating membrane of the rabbit on the injection of heparin either systemically or locally. Injections of "merthiolate" or moccasin snake venom exhibited always petechial hemorrhages but only rarely the phenomenon of white emboli. This summer I repeated the experiment by systemic injection of heparin and have observed the same phenomenon of white emboli in the capillary circulation of the cheek pouch of the hamster.[10] Immediately thereafter blood samples were secured directly from the heart and placed between cover slips. Numerous small white emboli were observed in undiluted blood and in blood diluted with isotonic sodium chloride solution, 1:10. These emboli, which consisted of platelet agglutinates to which white cells adhered occasionally, were of the same size as the emboli seen in the capillary circulation.

Apparently embolization induced by heparin which accounts for the thrombopenia may also take part in the formation of the petechial hemorrhages. This may occur not only in heparinized subjects but also in men and in animals exposed to ionizing radiation.

Council on Physical Medicine

The Council on Physical Medicine has authorized publication of the following report.

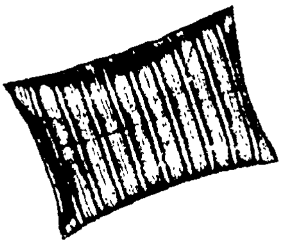
Howard A. Carter, *Secretary*

DURA-LATEX PILLOW ACCEPTABLE

Manufacturer: Century Fabrics Company, 831 West Van Buren Street, Chicago 7.

The Dura-Latex Pillow is designed for the use of patients afflicted with allergies. It is intended that this pillow will alleviate distress caused by symptoms of allergy and asthma due to inhalation of products of disintegration or deterioration of such pillow fillings as down, feathers, wool or kapok. The pillow is made of a heavy grade cotton pillow ticking, containing two muslin dividers which create three separate pockets within the ticking. These pockets are filled with foam rubber, which has been shredded into flakes. The foam rubber is made by frothing natural or synthetic liquid latex along with other ingredients into a foamy consistency which is molded and cured into a soft resilient mass. This mass is then shredded into the flakes which are used for the filling. The use of the dividers forming separate pockets within the pillow prevents the shredded flakes from bunching up in one portion of the pillow.

The dimensions of the pillow are 66 by 46 cm. (26 by 18 inches); the thickness is roughly 10 cm. (4 in.) and the weight 1.8 Kg. (3 pounds, 15 ounces). The shipping weight is 4 pounds, 8 ounces (2 Kg.).



A sample pillow submitted by the firm was examined independently by two allergists who reported it satisfactory. One noted a slight odor of rubber, but both were of the opinion that contact dermatitis or other symptoms in rubber-sensitive patients were unlikely in view of the construction of the pillow casing. Both recommended acceptance.

The Council on Physical Medicine voted to include the Dura-Latex Pillow in the list of accepted devices.

THERAPEUTIC EAR LAMP ACCEPTABLE

Manufacturer: Air-Shields, Inc., Hatboro, Pa.

The Therapeutic Ear Lamp is a small source of infrared radiation shaped somewhat like a headphone; it may be fastened over an affected ear by means of the attached head bands. It can be plugged into any 110 volt outlet, either alternating or direct current. Since it lacks a switch, it must be turned off by pulling out the plug.

A specimen of the apparatus was examined for the Council in a children's division of a large hospital acceptable to the Council. The report stated that the lamp afforded some relief from pain in acute otitis. It was difficult to keep in place on the heads of children "particularly because of the shortage of nurses"; the youngsters would take it off or pull out the plug attachment. Nevertheless, the investigator concluded that the apparatus was not dangerous in any way.

The Council on Physical Medicine voted to include the Therapeutic Ear Lamp manufactured by Air-Shields, Inc., in the list of accepted devices.

EDITORIAL ANNOUNCEMENT

The absence of the compositors from their work continues. This issue of THE JOURNAL has been prepared in part by the use of Vari-Typer machines.

THE NATIONAL HEALTH ASSEMBLY

The National Health Assembly which heralded the beginning of May in Washington, D. C., established what is apparently a new record for such conferences. Definite efforts were made to ascertain points of view, to attach proper weight to each of them, and on the basis of the evidence submitted, to propose recommendations which might be considered objectives or goals in advancing health during the next ten years. Previous conferences have been suspect of having propaganda in behalf of certain proposals leading to legislation as their prime motivation. If that was the original intent of the National Health Assembly of 1948, and it seemed to be such when the proposed assembly, its financial supporters and executive committee were announced a few months ago, the subsequent developments and the final action taken have resolved the doubts and anxieties. For this credit should be be assigned perhaps to Mr. Ewing and his associates, notably Dr. Howard Kline, who evolved from the original executive committee of twenty-four members with only one physician a final committee aggregating thirty-nine with official representation for the American Hospital Association, the American Dental Association, the conference of State and Provincial Health Officers, the American Medical Association and similar bodies. On this executive committee will fall the final responsibility for evaluating the recommendations that come from the different panels or sections and for issuing a final statement to clarify objectives in health for the people of the United States.

Between seven hundred and eight hundred interested members of almost every agency in the United States concerned even remotely with health registered in the assembly. At least half of them were enrolled in sections devoted to such topics as medical personnel, local health units, research, nutrition, maternal and child health, chronic diseases and age, medical care and other significant classifications. These sections held four or more meetings in which opportunity to speak was given to any of those who wished to be heard on the subject of their own experiences or their criticisms of the opinions and experiences of others. As might be anticipated, panaceas, short-cuts, regimentations and revolutions were offered as solutions of the problems in the advancement and development of medical services. The bizarre and weird recommendations of radical proponents for remaking our system of medical care fell by the wayside. The recommendations of the steering committees in the individual panels seemed likely to yield technics for steady and continuous progress in meeting our medical needs.

In subsequent issues of THE JOURNAL the reports of each of the panels will be made available. The recommendations may be given consideration by the appropriate councils, committees and bureaus of the American Medical Association and by the House of Delegates, which will speak for the American Medical Association as to the policies considered acceptable.

Fortunately in this assembly, as contrasted with the National Health Conference of 1938, the American Medical Association was represented by competent experts in each of the fields concerned. Several members of the Council on Medical Service participated in the panel on medical care. Chairmen in several sections, notably maternal and child health, research, local health units, medical care, physical medicine, hospital facilities and mental health were distinguished Fellows of the American Medical Association. Members in adequate numbers served on the panels devoted to rural health, community organization, public health, hospitals, personnel and environmental sanitation. The Association had available, moreover, its public relations and publicity staff and additional members on the executive committee. The President of the American Medical Association and the Editor of

THE JOURNAL spoke before meetings of the entire assembly. The President-Elect, members of the Board of Trustees and of the various councils addressed the individual sections.

Clearly apparent from the first note sounded by Mr. Oscar Ewing in his opening address was recognition of the fundamental importance of a high quality of medical education for the solution of every medical problem. Second in emphasis was the necessity for consumer and professional cooperation in the development of adequate medical care at costs within the range of the mass of the people. Third was a perception of the necessity for continued experimentation in the development of technics of providing and distributing medical care suitable to the needs of a diversified population under varying economic conditions. Fourth was emphasis on the special problems of the Negro physician and the Negro patient. Such corollary questions as the availability of animals for experimentation, of funds for conducting the medical schools and research institutions on a high plane, hospitalization and health centers, technics of transportation of the sick for rural areas, cooperatives for health, group practice, medical insurance on a service or fee-for-service basis and elimination of the profit motive in prepayment plans developed extended discussion and indicated the need of more study by experts.

President Harry S. Truman, the only speaker at the opening banquet, indicated again his concern over the health problems of the nation and his continued conviction that a compulsory sickness insurance system is an acceptable solution. By far the majority of representatives of the medical profession present could not concede on this point. The voices raised in support of this contention were the same old, and now somewhat weary, voices of the Physicians' Forum, Committee on the Nation's Health, the economists of the national headquarters of the A. F. of L. and the C. I. O. When the tumult and the shouting died, the record seemed to indicate that the Blue Cross Hospitalization Plans, the nonprofit voluntary prepayment plans, the cooperatives, the group health associations, the private agencies and other forms of organization for the delivery of medical services had enrolled millions and millions of people. While there were still knotty problems not yet unraveled and areas of insufficiency not yet supplied, the nation seemed to be on the way toward the development of a plan for the production and distribution of medical services suitable to the American democracy.

DIETARY THERAPY OF HYPERTENSION

Kempner[1] reported striking therapeutic effects in a majority of his patients with hypertension by the use of a diet of rice, fruit and fruit juice. From their tests on experimental hypertensive dogs, confirmatory tests of these effects were reported by Dick and Schwartz[2] of the Department of Medicine, The University of Chicago. Hypertension was produced in these dogs by the intravenous injection of streptococci.[3] The initial mean arterial blood pressure of 120.3 mm. of mercury was increased to an average of 181.6 mm. of mercury by such injections. The hypertension was maintained at this high level for two to four years. During this period the dogs were fed on meat and dog biscuits, approximately 900 calories per day. This routine diet was changed for eight weeks to a mixture of 170 Gm. of rice, 340 cc. of fruit juice and 60 Gm. of sugar, plus daily supplements of the necessary vitamins—a total daily intake of 900 calories. By the end of eight weeks the average arterial blood pressure of these 12 dogs had fallen from 181.6 mm. of mercury to 138 mm. of mercury, an average reduction of 43.6 per cent. In certain dogs the reduction was as much as 88 per cent; i.e., from 200 mm. of mercury to 132 mm. of mercury; 120 mm. of mercury was the approximate previous normal level. All dogs lost weight on the "rice" diet, the average loss being nearly 20 per cent.

Grollman[4] and his associates have suggested that part of this reported beneficial effect of the "rice" diet was due to a rigid restriction of sodium. A test of this factor was made by Bryant and Blecha[5] of the Diet Therapy Clinic, University of Michigan. For periods of several weeks to twelve months 100 patients with essential hypertension were placed on a diet of 2,200 calories, containing approximately 200 mg. of nitrogen, 2.2 Gm. of potassium, 70 Gm. of protein, 80 to 175 Gm. of fat, 130 to 230 Gm. of carbohydrate and vitamin supplements. A daily fluid intake of 3 liters was maintained.

No pretreatment blood pressure was below 170 systolic and 100 diastolic. There was a significant lowering of blood pressure to or below 155 systolic and 95 diastolic in approximately 20 per cent of their cases, and a lowering of diastolic pressure to or below 95 in an additional 15 per cent. Several patients who originally displayed papilledema and moderately severe heart failure became free of symptoms and have shown a definite decrease in heart size accompanying the fall in blood pressure. Older patients with long-standing hypertension have experienced more striking improvements than younger patients. In a few instances, symptoms suggestive of sodium privation have been observed, which were readily controlled by a reduction in fluid intake.

[4] Grollman, A.; Harrison, T.R.; Mason, M.F.; Boxter, J.; Crampton, J., and Reichmann, F.: Sodium Restriction in Diet for Hypertension, J.A.M.A. 129: 533 (Oct. 20) 1945.

[5] Bryant, J.M., and Blecha, E.: Proc. Soc. Exper. Biol. & Med. 65: 227, 1947.

Rigid restriction of sodium intake thus presumably explains in part the favorable results reported in hypertensive dogs when placed on a rice—fruit juice diet. Other concernable factors in this diet are now under investigation. Experimental renal hypertension in dogs, however, finds its counterpart in only a relatively few cases of hypertensive disease in man, so that results from the canine tests will be of only limited clinical application.

Current Comment

THE PROPOSED DRAFTING OF PHYSICIANS

The Council on National Emergency Medical Service, after considering the proposed drafting of physicians in connection with the reactivation of selective service, announces that it opposes any legislation that singles out doctors of medicine as a separate group from their fellow citizens for registration, draft, induction or selection for duty with the armed forces of our country. The Council strongly urges immediate establishment of a civilian medical board at the highest level of government, such as a functioning agency of the National Security Resources Board, to be responsible for the policies and programs required for the medical, health and sanitary services of the civilian population, of industry, of agriculture and of the armed forces in time of emergency or national mobilization. In time of a national emergency as differentiated from the current proposed expansion of the armed services, the Council recommends the establishment of the following priority system for the activating or the calling up of civilian medical personnel or units into the armed forces·

1. Those recent graduates who were enrolled in A.S.T.P. or V-12 programs who have not completed their obligated tour of duty as a medical officer and all others who were deferred by Selective Service to continue their medical education.
2. Other physicians who did not serve in World War II.
3. Those physicians who served the least in World War II.

The Council urges each state and local medical association to exert every effort and influence at its command within the next several days to assure the establishment of a civilian medical board in the highest level of our national government, such as a functioning unit of the National Security Resources Board. Appeals should made not only to elected representatives in Congress but to Mr. Arthur Hill, Chairman of the National Security Resources Board, Washington, D. C., and Mr. James Forrestal, Secretary of Defense. The creation of such a civilian medical board is an urgent necessity if a sound medical program and policy is to be established at the national level for the civilian population, for industry and for agriculture to be effective in a time of national emergency. The program should become operative preceding the accomplishment of the request of the armed forces, which must of neccessity deplete the limited national resources in medical personnel and facilities.

THE DISTINGUISHED SERVICE MEDAL

The eleventh award of the Distinguished Service Medal of the American Medical Association will be made at the Inauguration Meeting Tuesday evening, June 22, during the Chicago Session. This award is recognized as one of the highest honors within the gift of the American Medical Association. The medal was first presented in 1938 to Dr. Rudolph Matas of New Orleans. Since that time it has been presented to Dr. James B. Herrick of Chicago, Dr. Chevalier Jackson of Philadelphia, Dr. James Ewing of New York, Dr. Ludvig Hektoen of Chicago, Dr. Elliott P. Joslin of Boston, Dr. George Dock of Pasadena, Calif., Dr. George R. Minot of Boston, Dr. Anton J. Carlson of Chicago and Dr. Henry A. Christian of Boston. Any Fellow of the American Medical Association may submit nominations, which should be sent, together with a record of the scientific services of the nominees, to the chairman of the Committee on Distinguished Service Awards. Dr. William Weston, 1428 Lady Street, Columbia, S. C., or to the Secretary of the Association at 535 North Dearborn Street, Chicago. After careful consideration of all nominations received, the Committee will submit five names to the Board of Trustees, and the Board will select three of the five for presentation to the House of Delegates at its first meeting during the Chicago Session. The House of Delegates makes the final selection by official ballot. The recipients of the Distinguished Service Medal thus far have been physicians of distinction whose selection has honored not only the men themselves but also the American Medical Association. Nominations should be received by Dr. Weston not later than May 30. Obviously an extensive list of distinguished physicians nominated for this award will enable selection of a recipient whose name will add luster to the list of those previously chosen.

REPORTS OF OFFICERS

NOTE.—At the 1925 session of the Association, the House of Delegates suggested that all reports of officers, committees, etc., and resolutions to be brought before the House, if available, be published in advance of the session so as to permit careful consideration and discussion.—Ed.

REPORT OF THE SECRETARY

To the Members of the House of Delegates of the American Medical Association:

The following report of the Secretary is respectfully submitted:

Membership

On April 1, 1948 the official membership list of the American Medical Association contained the names of 136,668 physicians, representing an increase over the preceding year of 4,444. In preparing this report, the Secretary found it of interest to make certain comparisons: Ten years ago, on April 1, 1938, there were 109,435 members of the Association and, according to figures compiled by the Biographic Department, there were 173,879 physicians in the United States and its dependencies. The biographic records in 1948 show 201,200 physicians in the United States and dependencies, an increase of 27,321. It is interesting to note that the increase in membership in the American Medical Association over the ten year period was 27,233, only 88 less than the increase in the number of physicians. It would appear that the American Medical Association is indeed representative of the entire medical profession of the country.

Fellowship

The Fellowship roster on April 1, 1948 carried the names of 76,161 Fellows, an increase over the preceding year of 3,273. The loss of a little more than 5,500 Fellows during the war years has been recovered, and the number enrolled on April 1, 1948 is the highest that ever has been recorded since Fellowship was established many years ago. This, also, is evidence of the strong position the Association holds in the leadership of the American medical profession.

The usual table showing membership and Fellowship in the constituent state and territorial medical associations accompanies this report.

Conference of State Secretaries and Editors

The annual conference of state medical society secretaries and editors was held at Association headquarters in Chicago on Nov. 7 and 8, 1947. As had been done for the first time in the previous year, a committee of conference members made up the program. New departures in 1947 were panel discussions held in various offices throughout the building and separate dinner meetings for the secretaries and the editors. Some of those in attendance expressed disappointment that it was not physically possible to attend each panel discussion and each evening meeting. The committee to arrange the program for the 1948 conference will undoubtedly bear that fact in mind.

The members of this conference, primarily the secretaries of the constituent state medical associations and the editors of the state medical journals, find in it much of value to them in their official capacities. It is the only meeting sponsored by the Association which brings together at one place and time the executive workers in the constituent organizations. It affords them and the headquarters staff opportunity to get together and iron out any wrinkles in office detail that may have developed and also affords a unique and valued opportunity for the secretaries and editors to learn more about what is going on in other states than can be learned from any other source.

In recent years official personnel of many state associations aside from the secretaries and editors have attended the conference, and it is hoped that they will continue to do so.

Actions of House of Delegates

The Secretary has complied with provisions of resolutions adopted at the Atlantic City Annual Session and the Cleveland Interim Session of the House of Delegates either by direct correspondence from his own office or by reference to the proper Council, Bureau or Committee of the Association.

Field Activity

As in the previous year, the Secretary has attended and participated in a great many meetings of state medical associations as well as a number of meetings of organizations closely allied to the medical profession. He has accepted active membership on a number of committees other than those of the Association having to do with medical affairs. While this activity has, of course, caused frequent absences from the office, it is believed that any consequent delay in routine work is offset by the advantages of wide personal contact with all phases of medical organization.

Assistant Secretary

Some time ago the Board of Trustees authorized the employment of an Assistant Secretary and on April 1, 1948 Dr. Ernest B. Howard became affiliated with the American Medical Association in that capacity. Dr. Howard is a native of Massachusetts, a graduate of Harvard University, Harvard University School of Public Health and Boston University School of Medicine. He is licensed to practice medicine in Massachusetts and in California. He was at one time director of the Division of Genito-infectious Diseases in the Massachusetts Department of Health and later was assistant director of the Venereal Disease Control Program of the United States Army, Office of the Surgeon General. For the past two years Dr. Howard has served as chief of the Health and Sanitation Field Party in Peru for the Institute of Inter-American Affairs.

The Secretary is confident that the employment of Dr. Howard as Assistant Secretary will prove to be an advantageous and forward step for the association.

All these activities have played a vital role in educating the American public to the advancements of medical science, plus the unexcelled services which physicians render for the benefit of mankind.

Office of Executive Assistant

Coordination and Public Relations

The public relations activities of the American Medical Association are being coordinated with the state and county medical societies and the public through the Office of the Executive Assistant to the Secretary and General Manager. This Office is now directed by Mr. Lawrence W. Rember, who assumed his duties Dec. 16, 1947. At the same time Theodore R. Sills and Company was retained as Public Relations Counsel to the Association.

The Director of Press Relations and an assisting staff of three work as part of the Office of the Office of the Executive Assistant. The Board of Trustees has approved a public relations budget calling for the employment by the Executive Assistant of a staff assistant and a staff writer.

Service to State and County Medical Societies

An increasing number of constituent state medical associations and component county medical societies are expanding their public relations programs to include the addition to their staffs of a public relations director or field secretary. Other states are planning to employ public relations firms to assist them in expanding their public relations activities. A program is now being formulated by the Office of the Executive Assistant to be of continuing and growing service to those responsible for conducting state medical public relations programs and county and community medical public relations programs. This is to fill a need expressed by many societies.

Some of the services to be provided include (1) holding an annual American Medical Association Public Relations Conference, (2) acting as a receiving and distributing center for state and county society public relations ideas and materials, (3) being available to state associations for consultation, (4) participating in state and county society public relations conferences, (5) stimulating the development and enlargement of state and local programs, (6) originating and preparing public relations materials and ideas of value to state society and county society programs and (7) answering and servicing special public relations requests directed to association headquarters by state associations.

A survey of the medical public relations programs of state medical associations has been completed by the Executive Assistant. Staff provisions, budgets, channels employed, the first five public relations objectives, enlargement plans and unusual activities were studied. The results of this nationwide survey have been put into chart form and an analysis has been prepared to accompany the chart. These will be distributed to the state associations for their evaluation.

Several public relations mailings to state medical associations have already been made by the Office, and a high degree of interest and a most favorable response to this type of service has been indicated. The Executive Assistant attended the public relations meeting in Boston of the Council of the New England States Medical Societies to become more familiar with the public relations thinking and doing of state and county medical groups. He addressed the meeting of the Nebraska state and county medical society officers on the subject, "Public Relations, National, State and Local." He also attended the Public Relations Panel conducted during the Regional Conference on Medical Service at Cleveland. Mr. Theodore R. Sills addressed the Minnesota meeting of state and county medical society officers on the subject, "The Public Looks at the Doctor." Participation of this kind will undoubtedly multiply in the months ahead.

Secretary's News Letter

The weekly Secretary's Letter has become firmly established as a vital news liaison between the office of the Secretary and General Manager of the

Association and the medical profession and its component and constituent societies. Because of the increase in circulation to over 3,000 copies per Letter, requests for it from others than officers and committee members of national, state and county societies cannot be filled. Activities of the various Councils, Bureaus and Committees of the Association are being reported promptly in the Letter. National happenings outside of the Association which the Secretary feels should be called to the attention of recipients are included. Unsolicited comments reaching headquarters are most favorable to the Letter.

Service to Councils, Committees and Bureaus

Public relations problems confront the councils, committees and bureaus of the American Medical Association in their various relationships. The services of the Office of the Executive Assistant are accessible at all times and are frequently called on and extended.

One special phase of service is that of publicizing the interim and annual sessions of the Association. During the Cleveland Interim Session, it was frequently commented that "One of the most successful phases of this meeting is the splendid publicity obtained."

Another special phase of service is that of publicizing special conferences sponsored by councils and committees of the Association. For example, the National Conference on Rural Health, because of its public relations value, was used as a test of what could be accomplished with adequate public education organization and manpower. Four radio networks, coast to coast, broadcast special news interviews and news salutes on the Conference. One hundred and twenty-six radio farm directors included news reports and analyses of the Conference on their farm hours, which reach millions of rural listeners. Over one hundred national, regional and state farm magazines received a complete set of news digests of the Conference speeches, and in addition special human interest photographs were furnished to some publications. Newspapers, both daily and weekly, throughout the United States received news stories over the wires of the Associated Press, United Press and International News Service and through the services of the Western Newspaper Union and the National Women's News Syndicate. In addition, forty nationally known science writers got the news. About five hundred persons attended the Conference in Chicago. Many more than 50,000,000 persons attended the Conference via their radio sets, newspapers and magazines. Such is the power of publicity in extending the valuable work of the councils, committees and bureaus of the Association.

Press Relations

Press relations is a vital part of public relations. One of the chief functions of the Press Relations Bureau is to write and distribute the weekly news bulletin, *American Medical Association News*, which contains official announcements of the Association and condensations of original articles and editorials appearing in THE JOURNAL, *Hygeia* and the special journals. This news release, containing material which may be reprinted or republished, is mailed to approximately 1,200 newspapers, press associations, magazines, radio stations, industrial house organs, medical journals and bulletins. All those who receive the release have made specific, voluntary requests to have their names placed on the mailing list. Through the years, the *American Medical Association News* has become a recognized medium for the dissemination of news pertaining to medical progress. A casual perusal of a few magazines and newspapers indicates that there is a wide interest in articles on medical subjects.

During 1947 the Press Relations Bureau received more than 4,000 inquiries from newspapers, press associations, magazines, radio stations and the like. These information centers have come to rely on the Bureau for accurate scientific facts on medicine and health. An estimated 63,000 individual stories, based on Association news releases, were published in newspapers in every state in the union during the year. The estimate is made on the basis of press clippings received in the headquarters office. The response to American Medical Association releases was much better because of the gradual relaxation of wartime restrictions on newsprint. From the number of clippings received, more newspaper and magazine stories about the Centennial Session in Atlantic City were published than for any other medical meeting ever held anywhere in the world. More than seventy writers were registered for the five day session, including three science writers from the Associated Press alone. Mr. Howard Blakeslee of the Associated Press, dean of American science writers, reported that eight thousand words a day were written on various phases of the Centennial Session by the Associated Press writers alone, the biggest single file that ever moved out of a convention city.

The press representatives were tendered a luncheon on the Saturday preceding the meeting at which time they were provided with abstracts of the most important scientific papers and with information concerning the special functions of the week. Two press rooms were in continuous operation, one in the convention hall and the other in the Traymore Hotel, where the House of Delegates met. The Press Relations Bureau provided many periodicals of national circulation with pictures related to the medical profession. These appeared on their covers and in feature articles during the Centennial Session.

During the Interim Session in Cleveland, newspapers were provided with abstracts of the best scientific papers delivered. From the point of view of publicity at that session, the award of the General Practitioner's Medal to Dr. Archer C. Sudan of Colorado made a real hit. The story of his success as a general practitioner in a small Colorado mountain town was carried far and wide by newspapers, magazines and radio stations.

The *American Medical Association News* reached a new all time high as far as newspaper response is concerned with the issue of Sept. 26, 1947. The five Chicago newspapers alone published a total of fifteen stories taken from this single issue. All the stories appeared in one day. This marked the greatest single day response since the publication was started several years ago.

Another story which received a "good play" in newspapers dealt with "Medicine and Economics"; it was written by Dr. Ernest E. Irons, Secretary of the Board of Trustees of the Association. His statement told how government medicine would give the American people an inferior, rather than a better, quality of medical care by limiting practitioners to "the deadly level of only average attainment." The *Chicago Tribune* alone devoted more than half a column to Dr. Irons' paper.

The gratifying response which the Press Relations Bureau has received from the press during the year indicates strongly that editors, reporters, feature writers and radio news commentators from every section of the country look to the headquarters office of the Association as a dependable source of information regarding medical matters. They have sought information and advice on every phase of the multiple activities of the Association and of the profession. The Press Relations Bureau through its close contact with these groups, has succeeded in "killing" a great deal of inaccurate medical information. On many occasions inaccurate information regarding medical matters has been corrected in the process of publication, while in other cases such inaccurate information has been eliminated completely through the advice and service offered.

All these activities have played a vital role in educating the American public to the advancement of medical science, plus the unexcelled services which physicians render for the benefit of mankind.

Other Services

Many other public relations activities are carried on which arise out of the exigencies and opportunities of day to day operations. Professional and trade associations, institutions, companies and corporations, through their public relations departments, turn to the public relations department of the American Medical Association for assistance. This runs the gamut in variety of requests and needs to be met. The performance of such service through the public relations department has become an accepted part of modern business activity. Increased public good will and acceptance for the Association and the profession is the direct gain.

In Appreciation

The officers and members of official bodies as well as innumerable members and Fellows of the Association not in official position have throughout the year been most helpful and considerate in all situations that have arisen, and the Secretary wishes to express his sincere appreciation. The personnel at the headquarters office also has been most helpful and deserves much praise.

Respectfully submitted,

GEORGE F. LULL, Secretary.

REPORT OF THE BOARD OF TRUSTEES

To the members of the House of Delegates of the American Medical Association:

The following annual report of the Board of Trustees is respectfully submitted to the House of Delegates.

Income and Expenditures

The official reports of the Treasurer and the Association's Auditors are appended as a part of this report.

Revenues which reached a new peak of $4,233,580.25 in 1947 were offset by larger expenditures amounting to $4,284,427.55. The excess of expenditures over income was $50,847.30; an estimate prepared in advance of the year's end indicated a larger excess in expenditures than actually occurred. Broadened activities of the Association requiring additional personnel, higher basic wage rates for mechanical and clerical employees and materials purchased at higher prices than in the preceding year are accountable for the deficit. Total wages and salaries for the year amounted to $2,347,671.00, as compared with $1,916,310.69 in 1946. Expanded facilities of councils, bureaus and departments caused an increase in expenditures from $890,178.99 in 1946 to $1,128,427.65 in 1947, a difference of $238,248.66.

Direct taxes paid by the Association, exclusive of sales and excise taxes, aggregated $74,433.75. Only a nominal amount of $1,000 was paid for legal expense in 1947.

The cost of publishing periodicals increased to $2,840,344.46 in 1947 from $2,414,163.44 in 1946, due in part to increased circulation of some periodicals but principally to higher costs. Income from subscriptions to periodicals published by the Association amounted to $1,558,483.11, while the income from the same source in 1946 amounted to $1,506,046.90. Advertising income from periodicals published by the Association totaled $2,342,605.39 in 1947, compared with $2,079,081.60 in the previous year. Interest from investments produced a return of $133,998.80.

The Journal of the American Medical Association

The circulation of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION has achieved a peak

TABLE 1.—*Approximate Count of Fellows and Subscribers on The Journal Mailing List Jan. 1, 1948 Showing Gain or Loss*

State	Fellows	Subscribers	Totals	Gain	Loss
Alabama	605	510	1,115	54	
Arizona	281	254	535	50	
Arkansas	375	371	746	44	
California	4,881	6,377	11,258	780

never heretofore achieved by any other medical publication and representing the leading position that it occupies in medical literature. Its contents are carried to the most remote sections of the world. Missionaries in the Far East and Africa receive it regularly, in many instances as their one source of contact with medical science. From many foreign nations have come requests for complete files of THE JOURNAL to replace those lost in libraries devastated by the war.

As the foreign literature has begun to appear again, THE JOURNAL has taken adequate cognizance by including in its Current Medical Literature columns a listing of the contents and abstracts of the original articles in these publications. The foreign correspondence in THE JOURNAL now includes regular correspondents in London, Paris, Rome, Naples, Madrid, Geneva, Brussels, Amsterdam, Oslo, Stockholm, Ankara, Moscow, Australia, Mexico City, Puerto Rico, Rio de Janeiro, Sao Paulo, Buenos Aires and La Pas (Bolivia). THE JOURNAL maintains a regular correspondent in Washington, D. C., and includes material not only in its Washington Letter but also in the sections devoted to various governmental agencies.

TABLE 2.—*Percentage of Physicians Receiving The Journal* *

State	Number Receiving Journal	Physicians in A. M. Directory	Approximate Percentage Receiving Journal
Alabama	1,115	2,123	53
Arizona	535	615	87
Arkansas	746	1,806	41
California	11,258	12,365	91

Wisconsin	2,298	3,551	65
Wyoming	161	263	61

* This table gives the number of physicians (based on the 17th edition of the American Medical Directory) in the United States, the number receiving THE JOURNAL and the approximate percentage in each state. Copies to physicians in the United States Army, Navy and Public Health Service are not included.

The columns of THE JOURNAL are exceedingly pressed at this time for space to be devoted to the activities of the many committees, councils and bureaus which are now official agencies of the American Medical Association. Thus, much space has been devoted to the Joint Committee for the Coordination of Medical Activities and to annual conferences on rural health, on medical education and on industrial health, to the district meetings of the Council on Medical Service, to the reports of the Council on Emergency Medical Service and to the studies made by the Bureau of Medical Economic Research and similar agencies. Space has been assigned for reviews of medical motion pictures. The demand for space is giving the trustees much concern; there is in prospect consideration of a special publication to be devoted largely to the social-economic and industrial aspects of medicine.

The weekly average of copies of THE JOURNAL printed in 1947 was 134,310, which is 11,475 more copies than were printed in 1946. The net paid weekly average circulation in 1947 was 132,664 copies, a gain of 11,542 over the preceding year.

The accompanying table 1 shows the number of Fellows and subscribers on the mailing list of THE JOURNAL as of Jan. 1, 1948. Table 2 indicates the number of physicians in each state, the number receiving THE JOURNAL and the approximate percentage of subscribers in each state.

As more paper has become available, THE JOURNAL has been able to extend somewhat its content, limited, however, by labor difficulties. Special issues have included those devoted to education, hospital, state board (licensure), the annual session, the interim session and industrial health numbers, as well as three index numbers.

Field Service of Editorial Staff

Many calls come to the editorial staff of the American Medical Association for addresses on a variety of subjects to audiences of both the medical profession and the public. They are requested also to conduct courses in educational institutions on scientific writing, standardization of nomenclature and similar medical subjects.

Dr. E. P. Jordan, an associate editor who formerly edited the "Standard Nomenclature of Disease and Standard Nomenclature of Operations," has resigned from the staff and has been replaced by Dr. Richard J. Plunkett. Doctor Plunkett has assumed also the editing of the Standard Nomenclature and has attended several scientific meetings devoted to problems of nomenclature. The Board of Trustees has called a conference on nomenclature to be held in the headquarters office of the Association June 23, 1948, with a view to the preparation of a new revision of this book and its publication about 1950.

Dr. Johnson F. Hammond, an associate editor, has made several addresses each year to groups of physicians interested in problems related to medical writing and medical publication and to students in journalism and social welfare who have visited the headquarters office.

The Editor of THE JOURNAL delivers many addresses each year to county and state medical societies, business clubs, forums and educational institutions. During the current year he has conducted courses in medical writing for the American Academy of Ophthalmology and Otolaryngology and also at the University of Illinois College of Medicine. The Editor serves also on the scientific advisory boards and on the directorate of such organizations as the American Red Cross, the National Foundation for Infantile Paralysis, the American Heart Association, the American Cancer Society and the Division of Medical Sciences of the National Research Council. He has served also as consultant to several national organizations and publications and to the Army and Navy medical departments.

Special Journals

The high standard of the nine special scientific journals published by the Association was maintained during 1947, in spite of difficulty in maintaining a sufficient staff of competent manuscript editors. For this reason, and also because the paper shortage has not been entirely relieved, the size of the special journals has not been increased to what it was before the war, and some delay has ensued in the publication of articles.

Excellent colored plates were published in practically all of the special journals. Part of the expense of the plates to reproduce illustrations in colors, which has increased considerably in the last two years, has been assumed by authors.

Dr. George E. Burch was elected to the Editorial Board of the *Archives of Internal Medicine* to succeed Dr. John H. Musser, who had served on the Editorial Board for fifteen years and who died in September. One of the special features of this periodical is its excellent reviews of the literature on blood, infectious diseases, vascular diseases, syphilis, neuropsychiatry, liver and biliary tract, the heart, allergy and gastroenterology. The editors are developing a special issue honoring Sir William Osler.

Dr. Howard Fox resigned as chief editor of the *Archives of Dermatology and Syphilogy*, and a special issue of that periodical in his honor was published in November 1947. Dr. Paul A. O'Leary, already a member of the Board, was appointed chief editor and Dr. Herbert Rattner was named associate editor. Dr. H. E. Michelson was added to the Board.

The July 1947 issue of *Occupational Medicine* was dedicated to Dr. Leroy U. Gardner. Special features of this periodical were the report of a Conference on Lead Poisoning, a special report on Cash Sickness Benefits for Railroad Workers and one on the Industrial Hygiene Division, Bureau of State Services, United States Public Health Service, and a symposium on Industrial Health Education and one on Workmen's Compensation, both of which were presented in the Section on Industrial Medicine and Public Health at the Atlantic City Session of the Association.

The *Archives of Otolaryngology* continues to publish summaries of the bibliographic material on functional examination of hearing, on tumors of the nose and throat, on otitis media and complications, on chronic progressive deafness, including otosclerosis and diseases of the inner ear, on tuberculosis, on tonsils and adenoids, on allergy and on peroral endoscopy. In the last volume there was a symposium on Fenestration of the Labyrinth which was presented at the annual meeting of the American Otological Society.

The *American Journal of Diseases of Children* printed two panel discussions, one on prematurity and one on adolescence, which had been presented before the American Academy of Pediatrics.

There was a total gain of $35,735.66 on five of the special journals, and a loss of $21,920.29 on four, so that there was a profit of $13,815.37 on the nine journals.

Each of the special journals, with the exception of *Occupational Medicine*, the newest member of the group, increased its circulation substantially during the year.

Book Publications

The American Medical Association press has in the past issued more than a score of books which have attained large circulation among the medical profession. Some of these books originate from articles published serially in THE JOURNAL; others originate with the individual councils and bureaus of the Association. The increasing demands made on the American Medical Association by the expansion of circulation of THE JOURNAL and of the special journals and also for the publication of material developed by the various departments and councils made necessary the transfer of the printing and publication of these books to private medical publishers. "The History of the American Medical Association" and the "Interns' Manual" are published by W. B. Saunders Company, Philadelphia. "New and Nonofficial Remedies," "The Epitome of the U. S. Pharmacopeia," "Useful Drugs" and "Fundamentals of Anesthesia" are published by the J. B. Lippincott Company, Philadelphia. "The Standard Nomenclature of Disease and Standard Nomenclature of Operations," "Medical Writing," "The Handbook of Physical Medicine" and a collected series of articles on cancer are in process of publication by the Blakiston Company. Negotiations are in process with other publishers for some of the other books published by the American Medical Association. Each of the books thus published will bear on the title page the statement "Published for the American Medical Association." By this agreement, the Board of Trustees has made it possible to circulate these books widely and to insure their proper promotion to the medical profession on a scale much larger than has been attempted previously. The income from these publications in the form of royalties reverts to the general funds of the American Medical Association.

Hygeia

In the field of education of the public on health, *Hygeia* occupies today the leading position of all publications in the United States. As a source for authentic material, it is in constant use by schools, educational groups, industrial organizations, lecturers and voluntary health organizations. The digest magazines in great numbers quote constantly from *Hygeia* so that its content is multiplied millions of times in a great variety of digest publications. Many newspapers and radio stations likewise depend on *Hygeia* as their source for material in the field of health. Among the campaigns in which *Hygeia* has been of special assistance are those on cancer, the heart, poliomyelitis, food, water and milk sanitation and many others. The American Red Cross has cooperated with articles on first aid and home nursing. *Hygeia* is also in process of developing a special section to deal not only with child care but also with behavior problems.

During the current year *Hygeia* has been published on the presses of Kable Bros. Company in Mount Morris, Ill. This has relieved to some extent the burden on the press of the American Medical Association. Moreover, certain advantages have accrued to *Hygeia* from the larger and more complete facilities of this large publishing house.

Circulation

Hygeia in 1947, for the first time in seven years, showed a loss. A new high, however, was reached in net paid circulation and in advertising income. The net loss of $48,683.94 was principally accounted for in the decrease in the amount of advertising secured and the increase in the cost of publication, the principal items being the printing of the magazine and salaries of clerical help. In fact, every item that went to make up the publication has gradually increased to practically double. A good share of the increased expense can be primarily attributed to the cost of producing the additional copies required by *Hygeia's* growing circulation. Over the twenty-five years of its existence, *Hygeia* has shown a net profit of $138,059.42.

The average monthly net paid circulation, during 1947 was 196,046 copies, as compared with 156,983 for the previous year, a gain of 39,063 copies.

For the second year the Student Group Study Plan in high schools was used. This plan offers *Hygeia* as an auxiliary textbook for classroom study at the special group rates on school orders of ten or more copies monthly, with a free copy to the teacher. A set of questions on articles in the current issue is mailed each month to the teacher as a guide in stimulating classroom discussion of health material. During the year the number of high schools using the plan increased to one hundred and twenty, with orders for a maximum of about 4,000 copies a month.

Subscriptions received in 1947 through the efforts of the Woman's Auxiliary to the American

Medical Association continued to show a gratifying increase. The orders received from this source totaled 20,145 years of subscription in 1947, as against 15,631 for the preceding year. For the sixth year, through the efforts of the Auxiliary, the Division of Health Education of the Pennsylvania Department of Health has renewed its ten month subscriptions for high schools in the state, placing 1,090 such subscriptions. During the past year, 1,450 nine month subscriptions were entered for all rural schools in Oregon through the efforts of the state auxiliary working in conjunction with the Oregon Public Health Association. Many of the active county auxiliaries have continued to introduce the magazine to new readers and to raise funds to present group subscriptions of *Hygeia* to schools, libraries, reading rooms and other organizations in their counties. The magazine is now being sent to state legislators in Indiana, Minnesota, Ohio, Oregon and Wisconsin.

During the year *Hygeia* was exhibited at the Annual Session of the American Medical Association and at the annual conventions of the American Nurses Association, the American Public Health Association, the American Home Economics Association, the American Dietetic Association and the National Education Association.

American Medical Directory

The Eighteenth Edition of the American Medical Directory is now being compiled, and it is hoped that the book may be ready for delivery during the early part of 1949.

Since publication of the 1942 edition, information on more than 42,000 new physicians has been added to the files and the names of more than 20,000 physicians who have died have been deleted.

During the last six weeks of 1947 information cards were mailed to all physicians in the United States, its dependencies and Canada, requesting them to provide current biographic information and their present address. Of the 210,000 cards mailed, 127,329 cards, or 60 per cent, have been completed and returned. A second request for information is now being sent to all physicians who have not responded to the first request.

Hospitals, libraries, medical societies and other organizations are now being sent a proof of the information listed in the previous edition of the Directory so that such data may be revised and brought up to date.

From early estimates it is expected that good support in the way of subscriptions will be received from physicians, hospitals and commercial firms.

Library

Although still operating under the difficult conditions prevailing in 1946, the Library continued to maintain its package library department and general reference services. Answers to approximately 6,000 reference questions were prepared during the year, many by correspondence and 2,355 through the preparation of package libraries on requested subjects. High blood pressure headed the list of subjects on which material was requested. The following subjects were also popular: pregnancy (all phases), the Rh factor, peptic ulcer, cancer, anesthesia, streptomycin, alcoholism, undulant fever and cirrhosis of the liver. Requests for this type of service came from every state in the United States. Numerous requests were received from European countries, particularly Italy, France, Hungary and the Netherlands, for material on recent advances in medicine in this country. Every effort was made to help the physicians making such requests and, while package libraries could not be sent to them, tear sheets from publications of the American Medical Association were prepared on the requested subjects and sent as gifts.

The periodical lending service increased considerably during the year. Requests for the loan of 12,232 periodicals were received, representing an average of approximately 1,000 periodicals a month. This service requires a great deal of clerical work. Of special notice are the increasing demands for Library service from the various Veterans Administration libraries throughout the country. Appreciation for the service given them during the year has been expressed in several letters.

An increasing number of requests was received from various foreign countries for the reestablishment of exchanges with American Medical Association publications. Approximately one hundred such exchanges were established with Latin American and European medical periodicals. A gradual resumption of the publication of German medical periodicals has begun, and requests have been received for the establishment of exchange relations from most of them. All such exchanges have been established with those German periodicals published in the American and British zones. Printed matter is not yet permitted to be sent into the Russian zone in Germany.

Three volume indexes of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION were prepared, as usual, in the Library.

The Library prepared an exhibit for the Centennial Session of the American Medical Association in Atlantic City, N. J. The work of the Library was explained by means of charts and sample package libraries. The exhibit undoubtedly acquainted many members of the Association with a service heretofore unknown to them, which is maintained by the Association at considerable expense for their particular benefit.

The American Medical Association Library was represented at a Symposium on Medical Subject Headings held in Washington, D. C., Dec. 12, 1947 under the auspices of the Army Medical Library.

Quarterly Cumulative Index Medicus

Due to circumstances beyond the control of the Association, only one volume of the QUARTERLY CUMULATIVE INDEX MEDICUS was published during 1947, Volume 40, covering the period July to December 1946. An unprecedented delay occurred in setting the type for this volume: copies were not mailed to subscribers until early in December 1947. Publications of the INDEX MEDICUS is becoming increasingly difficult, due to the lack of sufficient and trained personnel, paper shortages, binding delays and so forth. Many new periodicals were added to the list included in the INDEX MEDICUS, the great percentage of the new titles representing European and Latin American countries. All the more important French, Italian, Scandinavian and Belgian Periodicals are now being received and indexed. At the end of 1947 there were 1,156 periodicals included in the INDEX MEDICUS. Of this number, 634 were foreign language periodicals.

In spite of the delay in production, the total number of names on the mailing list increased in 1947 by 491. Publication of the Quarterly entailed a net loss in 1947 of $33,468.67, as compared with a loss of $51,154.09 in 1946.

Cooperative Medical Advertising Bureau

The Cooperative Medical Advertising Bureau continues to assist the state medical journals in securing advertising sales, reviewing copy for the purpose of following standards and servicing each account, thereby eliminating many details for the journal offices. Helpful suggestions for advertising make-up and listings of products currently accepted by the Councils of the American Medical Association appear in the Bureau Bulletin issued each month.

The present membership consists of thirty-four state journals. The South Dakota Journal of Medicine began publication in January 1948 and is now a member of the Bureau.

Dr. Carl B. Drake, editor of Minnesota Medicine, was elected a member of the Advisory Committee of the Bureau to succeed Dr. Eldridge M. Shanklin, editor of the Journal of the Indiana State Medical Association.

The annual report of the Cooperative Medical Advertising Bureau indicates a further increase in advertising sales during 1947 over 1946. The billing for 1947 amounted to $632,394.53 after allowing for agency discount. This does not include billing for the Rhode Island Medical Journal from July through November or for California Medicine for October and November, since these publications resigned their membership in the Bureau as of June and September 1947, respectively. Gross sales exceeded $700,000. After allowing the customary 2 per cent cash discount to advertisers, totaling $12,613, and deducting the Bureau's operating expenses of $32,510.35, the net amount disbursed to the member journals during 1947 was $587,271.18.

That the Bureau has made considerable progress since its reorganization in December 1945 is shown by the fact that the net billing was increased $135,223.42 the first year and $175,361.26 the second year; the total increased business for both years amounted to $310,584.77.

The net billing for 1946 and 1947 amounted to $1,224,651.33. Previous billing, from 1913 through 1945 was $4,909,356.23, making the total to date $6,134,007.56.

Contract renewals and business on hand so far for 1948 amount to $563,476.65 and the outlook to date with a renewal expectancy of $27,810.52 on some of the present contracts which will expire during the period from May to November 1948 amounts to $591,287.17. Therefore, there will be a slight gain in 1948 for the state journal group as a whole.

Council On Pharmacy and Chemistry

The Council on Pharmacy and Chemistry is internationally known as a leader in medical research. For forty-three years it has fought for the advancement of what is best in therapy; it has encouraged research by discussion and by aiding in the organization of formative plans; it has made available grants-in-aid; it has spread medical information by various means to professional and lay groups, and it has extended the scope of its activities as needs arose.

During the past year the Council continued to advance these activities and to consolidate many of its objectives.

Research

Many conferences were held with individual research workers, with research organizations and with representatives of commercial organizations that were planning research. The Council has been actively interested in assisting in the planning of research, especially where the cooperation of several groups was involved. During the year, eighteen grants were made available and approximately thirty papers were published under the auspices of the Committee on Therapeutic Research.

Therapeutic Trials Committee

Another means by which the Council encourages research is through the Therapeutic Trials Committee, a standing committee of the Council. Several contracts for clinical investigations were executed under the auspices of the Committee during the year. Work on the following projects is now under way, and preliminary progress reports have been submitted; action of aludrine sulfate in bronchial asthma; action of streptomycin and antimony derivatives in lymphogranuloma inguinale and the action of chlorophyll preparations on the healing of wounds and in chronic nasal disorders. Final arrangements are being made to investigate the physical-chemical requirements for the preparation of ophthalmic solutions.

At the request of the National Foundation for Infantile Paralysis, the Committee explored the feasibility of conducting a nationwide critical investigation of certain methods recommended for the treatment of acute poliomyelitis. A subcommittee prepared a report outlining its recommendations with regard to such an investigation and transmitted it to the National Foundation.

The final planning of the Committee-sponsored collaborative investigation of estrogens and androgens in mammary cancer was completed during the year. Thirteen pharmaceutical firms have donated more than 5 Kg. of testosterone and proportionately large quantities of six estrogens for use in this investigation. The American Registry of Pathology at the Army Institute of Pathology is providing facilities for centralization and examination of all pathologic and roentgenologic material collected in this project. Thirty investigators at outstanding institutions in this country and Canada are participating in this investigation. Close liaison has been established with the Committee on Growth of the National Research Council, the National Advisory Cancer Council and the American Cancer Society, all of which have made funds available to participating investigators. The Subcommittee on Steroids and Cancer, which is in direct charge of this project, submitted a report, which has been published, to the Council on Pharmacy and Chemistry in summarization of the present state of knowledge on steroid hormones and mammary cancer and with an indication of the problems which require solution.

Twenty-one medical schools and hospitals were visited during the year and their facilities for research surveyed; members of the faculties interested in investigation were interviewed.

The Therapeutic Trials Committee is contemplating calling a conference at the end of 1948 of all investigators participating in the collaborative study on estrogens and androgens in mammary cancer. The purpose of this conference would be to provide an exchange of information among workers participating in these investigations and to plan the future direction of the project.

Publications and Reports

Many thousands of Council-sponsored publications, now being printed and distributed by an outside printing establishment, were sold during the year, and the number will continue to increase as all possibilities are explored. New and Nonofficial Remedies, Useful Drugs and the Epitome of the United States Pharmacopeia and National Formulary have become standard reference books in many medical and pharmacal schools. Although New and Nonofficial Remedies is not recognized as "official" under the provisions of the Federal Food, Drug and Cosmetic Act, it is generally regarded along with the United States Pharmacopeia and the National Formulary as a standard source book for statements on actions and uses of drugs and for tests and standards. In fact, a number of countries recognize "N.N.R." as an identifying mark when products are presented for entry at their borders.

The Council also adopted for publication various reports concerning the prevention and treatment of disease, among them reports on the status of methionine in the prevention and treatment of hepatic injury, use of tetrathionate, drugs for obesity, the effects of streptomycin on tuberculosis in man, homologous serum jaundice, estrogens and androgens in mammary cancer, the significance of the tissue reactions caused by antigens and "allergasol." Hundreds of reprints of these articles have been requested by physicians and others with mutual interest.

Acceptance of Drugs

One of the activities of the Council is the evaluation of remedies with the view to determining their acceptance for inclusion in New and Nonofficial Remedies. During the year, manufacturers made two hundred and seventy-three presentations to the Council, fifty-nine of which were presentations on new drugs. Of this total, three were rejected and nine others were held either exempt from the Council's rules or ineligible for consideration.

Meetings

The Council held one meeting in 1947. Consideration of products submitted to the Council and other problems are normally conducted by mimeographed bulletins that are circulated every two weeks. The topics for discussion include problems associated with the use of multiple dose containers, the status of thyroxin, scillaren and thiouracil, the omission of sulfathiazole from New and Nonofficial Remedies because of its toxic properties, the use of a sulfonamide ointment for prophylactic purposes, the status of influenza vaccines and the effect of new strains of influenza virus, the status of protein hydrolysates and concentrates, amino acid mixtures and amino acids and the sale of "over the counter" items for reducing.

Collaboration

In addition to joint enterprise with other offices at Association headquarters, the Council and its office personnel or representatives worked closely with government and nongovernment, particularly philanthropic, agencies. For example, a representative appeared at the streptomycin conferences of the Veterans Administration, at the meetings of the Committee on Drug Addiction and Narcotics of the National Research Council and at meetings of the Committee on Blood and Blood Derivatives of the Advisory Board of Health Services of the American National Red Cross. The Secretary of the Council serves as a member of the U.S.P. Revision Committee and on several of the Pharmacopeial subcommittees. As soon as new products are accepted, the Council office transmits this information to the United States Public Health Service, Veterans Administration, Pharmacopeial Revision Committee, Committee on National Formulary, Army-Navy Medical Procurement Office and the American Pharmaceutical Association. During the latter part of the year, the Office of Technical Service requested the Council office to assist in the appraisal of microfilm dealing with German developments in medicine and related fields. This service is similar to one that was provided some time ago when the Office of Technical Service requested the Council office to assist in the evaluation of reports on drugs found in Germany by teams of scientists from the United States.

Staff of the Council Office

In addition to being available for consultation concerning Council problems, those members of the office staff who are professionally trained frequently appear in speaking engagements before other groups to explain the work of the Council and to discuss topics in which the Council has interest. The Secretary and other members of the staff appeared during the year before a significant number of medical, pharmacal and lay groups and addressed the students at several medical schools.

Appreciation

The Council on Pharmacy and Chemistry wishes to extend its appreciation to all who have assisted in its work, particularly the Board of Trustees, the personnel of other offices at Association headquarters and those apart from the Association who have so freely extended their facilities and information.

Chemical Laboratory

The Chemical Laboratory of the American Medical Association was instrumental in the development of tests and standards of identity, purity and potency for twenty-eight new medicinal products during 1947. In addition, it was responsible for the examination of nearly three hundred and seventy-five individual drug products in connection with consideration by the Council on Pharmacy and Chemistry.

During the past year, which marked the forty-first year of Laboratory operation, further reorganization of the staff has been accomplished. To keep abreast of the changes in standardization and in medical practice, the Laboratory must have, at all times, properly trained and experienced scientific personnel and modern equipment. This is necessary in order that the Laboratory may perform its chief function, complementary to that of the Council on Pharmacy and Chemistry, in the evaluation of medicinal agents which the medical profession is importuned to employ.

Work for the Council on Pharmacy and Chemistry

The Laboratory has drawn up tests and standards for the following products, which were examined in connection with Council consideration: d-desoxyephedrine hydrochloride ("norodin"-Endo); fibrin foam (human); absorbable gelatin sponge; mercocresols ("mercresin"-Upjohn); methadon hydrochloride ("dolophine"-Lilly); oxidized cellulose ("hemopak"-Johnson & Johnson); sodium ascorbate; diethylstilbestrol dipalmitate ("stilpalmitate"-Abbott); sodium ricinoleate solution ("soricin sclerosing solution"-Merrell); gold sodium thiomalate ("myochrysine"-Merck); dihydrocodeinone bitartrate ("hycodan bitartrate"-Endo); theophylline methylglucamine ("glucophylline"-Abbott); chlorguanide hydrochloride; diperodon ("diothane"-Merrell); oxyquinoline benzoate; dienestrol; sodium bismuth triglycollamate ("bistrimate"-C. D. Smith); butabarbital sodium ("butisol"-McNeil); sodium tetradecyl sulfate ("sotradecol"-Wallace & Tiernan); folic acid; propyl thiouracil; "dicumarol"; chloroquine diphosphate ("aralen diphosphate"-Winthrop); isobornyl thiocyanoacetate-technical; mannitol; choline dihydrogen citrate; para-aminobenzoic acid; para-aminohippuric acid, and dihydroxy aluminum amino-acetate.

Considerable time was spent in the examination of products for which standards are currently available in New and Nonofficial Remedies or in the U. S. Pharmacopeia and the National Formulary.

The Laboratory provided considerable assistance to the Council in connection with new monographs and descriptions of dosage forms published in THE JOURNAL during the year. It also aided in the revision of New and Nonofficial Remedies, 1947, especially through provision of many additional structural formulas and editing of the Section on Tests and Standards.

Work of a Miscellaneous Nature

A display indicating the nature of the Laboratory work during the past forty years was prepared and presented at the Centennial Session. Members of the staff have attended various scientific and technical conferences during the year, and a considerable amount of time has been spent in connection with the physical arrangement for the Annual and Interim Sessions of the Association.

Work for Other Departments of the Association

In addition to the work done for the Council on Pharmacy and Chemistry, the Laboratory has examined a number of products for the Bureau of Investigation and devices for the Council on Physical Medicine. It regularly provides technical advice to the Editorial Department and the Library in connection with chemical momenclature, phraseology and indexing. It examines and comments on medical products and devices for the Advertising Committee, when such products do not fall within the purview of a particular Council.

The Laboratory does not undertake commercial analysis on a fee basis, nor does it routinely undertake the analysis of specimens or products at the request of individual physicians. It must confine its work to those products of general interest to the medical profession and to the examination of new and nonofficial remedies. Only in this manner can the facilities and staff of the Chemical Laboratory accomplish the purpose for which it was founded, namely, to assist the Council on Pharmacy and Chemistry.

Council on Physical Medicine

In 1947 the work of the Council on Physical Medicine increased over that of the war years and indeed over any previous year of the Council's twenty-three years of existence. Approximately one hundred and twenty pieces of apparatus were submitted for consideration during the year, of which twenty-nine were considered, inspected and reported on in THE JOURNAL. Consideration is going forward on the remaining appliances. Among the devices were hearing aids, electrocardiographs, humidifiers, contraceptive devices, incubators, diathermy equipment, audiometers, stethoscopes, nebulizers, sunlamps and resuscitators. Contraceptive devices previously accepted by the

Council on Pharmacy and Chemistry were transferred to the list of accepted devices of the Council on Physical Medicine.

In the course of World War II physical medicine was employed by the armed services with significant success. Research was greatly stimulated; specialists in physical medicine in the Army and Navy carried the specialty over to civilian practice, and the general practitioner became informed about the value of physical medicine. Hence, physical medicine has gained in stature.

Publications

The booklet, "Apparatus Accepted," was completely revised and brought up to date. Eleven articles were published during the year: Tentative Standard Procedure for Evaluating the Percentage Loss of Hearing in Medicolegal Cases; Home Diathermy; Orthoptics—Second Paper; Minimum Requirements for Acceptable Electrocardiographs; Acceptance of Radiant Heaters; Minimum Requirements for Acceptance of Diathermy Apparatus; The Use of X-Rays for Treatment of Hypertrichosis Is Dangerous; Tentative Requirements for Acceptance of Respirators of the Cuirass Type; Minimum Requirements for Acceptance of Generators for Electrical Stimulation of Muscles and for Ion Transfer; Acceptance of Sunlamps (revised), and the Glossary of Terms Used in Discussions of Atomic and Nuclear Phenomena. Several other articles are awaiting publication.

Atomic Energy

The Council on Physical Medicine has been gravely interested in the medical aspects of atomic energy. Only a modest amount of radioactive isotopes has been made available for medical purposes to specialists by the Atomic Energy Commission. The results of clinical trials thus far released by the Commission have revealed a limited therapeutic usefulness. The scope for application of radioactive isotopes in medical research, on the other hand, seems infinite. The Council has sponsored several exhibits on the medical aspects of atomic energy. Within the limits of released information, the Council has endeavored to keep the profession informed. The pamphlet, "Glossary of Terms Used in Discussions of Atomic and Nuclear Phenomena,' has been most popular, and a copy of it may be had for the asking.

Artificial Respiration

Research in the field of artificial respiration has been financed through the year by a special grant awarded by the Board of Trustees. Many controversial aspects of artificial respiration as it applies to manual or mechanical methods have been clarified. Cordial cooperation with the American National Red Cross has resulted in careful and fruitful study of the problem.

Products Considered

Three sunlamps, one professional untraviolet lamp and one ultraviolet disinfecting lamp were considered by the Council and all were accepted. Two infrared lamps were considered; one was accepted and one rejected. Several pillows, and covers for mattresses and pillows for the relief of patients suffering with allergies caused by bedding dust, were considered and accepted. Generators of direct and alternating current for use in diagnosis and therapy were considered by the Council. It is the opinion of the Council that there is no necessity for multiplicity of current combinations in an apparatus, since the evidence submitted to justify some of them is not satisfactory.

Ultraviolet Radiation of the Blood

Therapeutic claims are made for the irradiation of blood. In the opinion of the Council, a device for irradiating the blood does not accomplish anything therapeutically which cannot be achieved by a simpler means.

Council Consultants

American Health Resorts—At the annual meeting of the Council in December, it was voted to appoint consultants on American Health Resorts. Prior to that time, questions on this subject were considered by a committee appointed directly by the Board of Trustees.

Artificial Limbs—The Council voted to reorganize its group of consultants and study the new prosthetic devices which have been placed on the market during and following World War II. The Council voted to prepare an article for publication on the subject.

Audiometers and Hearing Aids—The article "Tentative Standard Procedure for Evaluating the Percentage Loss of Hearing in Medicolegal Cases" has been published. The revised audiogram chart is ready for distribution. Twenty-six hearing aids were submitted and ten were accepted; the others are still undergoing consideration. Three audiometers were considered, but the consultants' reports on them are not complete.

Clinical Thermometry—This group of consultants is going forward with investigations of the problems of clinical thermometry, which involve more than the mere determination of the accuracy of clinical thermometers. The Council desires further information on various factors involving the use of the thermometers, as for example, the observational accuracy of a trained nurse, the accuracy expected by a physician, the manner in which the thermometers are used and the reliance which the physician is accustomed to place on the temperature readings.

Contraceptive Devices—Six devices were submitted during the year; one investigation was completed, and the report of acceptance appeared in THE JOURNAL. The remainder are still under consideration. The "Requirements for Acceptability of Contraceptive Devices" were revised and referred to consultants for action.

Education—The consultants noted with satisfaction that the American Board of Physical Medicine held its first examination for diplomates. Special study was focused on the training course for physical therapists. The Council has cooperated with the Council on Medical Education and Hospitals with regard to this problem and has maintained cordial relations with the American Congress of Physical Medicine.

Electrocardiographs—"Minimum Requirements for Acceptable Electrocardiographs" was published. Three instruments were submitted but none of the investigations of the consultants has been completed.

Electroencephalographs—A mimeographed copy of the "Minimum Requirements for Acceptance of Electroencephalographs" is being considered by the consultants.

Occupational Therapy—This group of consultants has continued its interest in the problems pertaining to occupational therapy and has so advised the Council.

Ophthalmic Devices—The article "Orthoptics—Second Paper" was published. At the annual meeting of the Council, it was decided that the consultant group was too large to work efficiently. The members were asked to aid in the selection of a new group of consultants.

Respirators—The article "Tentative Requirements for Acceptance of Respirators of the Cuirass Type" was considered and published. Four respirators have been considered on the advice of the consultants; one was accepted.

Roentgen Rays and Radium and the Medical Aspects of Atomic Energy—The medical profession, through the advice of this group of consultants, is being informed about the medical aspects of radioactive isotopes. Ointments containing radon were under discussion by the Council, but the evidence for their therapeutic value does not appear to be sufficient to substantiate the claims made for these preparations.

The Council office has prepared a number of exhibits for loan to state medical associations and scientific sessions of allied professions. The exhibit on "Medical Aspects of Atomic Energy" was particularly interesting to the members of the medical profession at large. Other exhibits have been prepared such as the physics of hearing aids and audiometers, artificial respiration and the general practice of physical medicine.

Council on Foods and Nutrition

One of its original functions, the review of advertising for accuracy of statements, constituted a major service of the Council on Foods and Nutrition to the profession in 1947. While it is obvious that the present quality of food advertising is vastly superior to that of a generation ago, it remains a very important duty of the Council to examine advertising claims in order to insure accuracy and to encourage continued general improvement. All advertisements for Council-accepted products are reviewed by the Council, and all other food advertising accepted by publications of the American Medical Association is passed on by the Advertising Committee, of which a representative of the Council is a member. Thus in 1947, as in the year of its organization, the Council continued to serve the members of the medical profession by weeding out unacceptable advertising copy and by the encouragement of those who produce accurate informative copy.

New Products Accepted.

In 1947 the number of new products accepted by the Council, including vitamin D milks, was one hundred and thirty-eight as compared with ninety in 1946. The number of pieces of general education copy accepted by the Council was more than twice that of the preceding year.

Vitamin D Milk Program

The Council's vitamin D milk program has been completely reviewed. On Jan. 1, 1948 Council-accepted vitamin D milks, all forms, numbered seven hundred and twenty-eight. A report was prepared concerning two of the major objectives of this program, namely, the encouragement of the wider use of vitamin D milk as a public health measure and the assurance of physicians and parents that as far as possible Council-accepted vitamin D milk regularly contains the number of units of vitamin D indicated on the container. Mimeographed copies of this report are available on request.

Council-accepted vitamin D bottled milks are sold in nearly every state, and it may be assumed that in practically all communities in the United States two or more brands of Council-accepted vitamin D evaporated milk or powdered milk are available.

The Council accepted two hundred and eleven different brands of evaporated milk to each of which is added 25 U.S.P. units of vitamin D per ounce. This is equivalent to 400 U.S.P. units per reconstituted quart.

Can the vitamin D potency of Council-accepted vitamin D milk be relied on to contain 400 U.S.P. units of vitamin D per quart or per reconstituted quart in the case of evaporated or powdered milk? This is a question of immediate interest to both medical practitioners and public health officers, who are concerned with the nutritional state of population groups. The recent survey by the Council indicated a total of less than 4 per cent of assays indicating fewer than 400 units of vitamin D per quart of bottled milk. Most of the unsatisfactory assays indicated only slightly fewer than 400 units per quart, while infrequently a report indicated that no vitamin D had been added. These data have significance, because assays are done on surprise specimens of milk taken without the dairyman's previous knowledge. It is believed that the vitamin D potency of Council-accepted vitamin D evaporated milk is consistently reliable.

When control of vitamin D potency in fortified milk is taken over by state or municipal health offices it is believed that the experience of the Council in voluntary control will be valuable.

Reexamination Of Accepted Products

The work of reexamining products which have been accepted for periods of more than two years is an essential continuing function of the Council in order to assure the physician, who relies on Council acceptance, that products once accepted will continue to be acceptable. This work proceeded at an accelerated pace in 1947. All the brands of iodized salt previously accepted by the Council were reexamined or are in the process of reexamination. Some of the foods used in infant feeding were also reexamined. It is hoped that this work may proceed at an even faster pace in 1948.

Potential Areas of Usefulness

The scope of the Council is such that within its purview come the special surpose foods and a few of the general purpose foods. The rapidity with which the knowledge of foods, nutrition and food technology is advancing indicates that the Council should increase the range of its usefulness and present reports to the profession on the nutritive merits of specific foods for which new methods of manufacture have been developed.

The effect on human subjects of the newer insecticides, fungicides, weed killers and other chemical substances which farmers are beginning to use must be viewed with a critical eye, and appropriate warnings must be passed on to physicians. Some of these substances adhere to the surface of the plant or may be incorporated in growing plant tissues, thus offering potential sources of injury to consumers of foods contaminated by such substances.

Appropriate also would be a review by the Council of some of the multitude of chemical substances which are annually being urged on the bakers of the country for the purpose of extending their shortening, making larger and softer loaves of bread and delaying staling and of many other agents intended to make processed foods appear more appetizing. The extent to which some of these substances have been investigated to rule out possible toxic effects is now only partially known. Active participation of the Council in consideration of these matters could assist the medical profession in the early identification and elimination of potential mass poisonings of greater or lesser severity.

Although there may be little reason for concern at this time, the contamination of foods with the products of nuclear fission is a subject which must not be overlooked as a potential area of Council activity. A large contribution to the University of Chicago's research project in nuclear physics by one of the large food manufacturers is an indication that at least some members of the industry are concerned with the potentialities of research in this field.

In the recent past physicians have been largely concerned with mineral and vitamin deficiencies in the diet. This interest will undoubtedly continue, and the concern of the Council in this field should expand in proportion.

The vast new field of study of the interrelationships between nutrients offers an intriguing and useful field of endeavor. Increasing knowledge in this field will assist in improved technics of individual and mass feeding. At the same time that advances are being made in the field of nutrition, ground must not be lost by failure to watch carefully for potentially toxic substances which may be incorporated in foods because of ignorance and carelessness.

Nutrition Education

The new edition of the Handbook of Nutrition is nearing completion and should be ready for the printers by July 1948. Those portions which are of particular interest to the medical practitioner are being printed first in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION.

The study of nutrition teaching methods in schools of medicine has been continued by a committee of the Council. A report on the pilot study is anticipated in 1948.

Assistance was given to the Bureau of Health Education in the production of a series of transcribed educational radio broadcasts on various phases of the subject of foods and nutrition. Thirteen platters have been prepared for the series, each representing the discussion of an assigned subject by an expert.

As previously mentioned, the Council has started the publication in THE JOURNAL of individual chapters of the Handbook of Nutrition. The Council has also published reports and has assisted in the preparation of a considerable number of articles on nutrition. Assistance has also been given in the preparation of reports on educational motion pictures having to do with nutrition. The Council office has cooperated with the work of other departments at the headquarters of the Association and has in return been helped by them.

Public Relations

Good public relations rest squarely on work well done and services performed. This premise has guided the efforts of the Council Office, and until a better basis is offered it will continue to be the chief motivating factor in the Council's activity.

Council Meetings

During the year the Council met twice at Association headquarters. Some of the items of general interest taken up at those meetings were: nitrogen trichloride-treated ("agenized") flour; flour and bread enrichment; fortification of milk with vitamin A; the relative clinical effectiveness of vitamins D_2 and D_3; fortification of skim milk with vitamins A and D; criteria for establishing evidence of the clinical effectiveness of protein supplements; the use of vitamins in industry, and iodized salt.

Council on Industrial Health

Interest in the health and welfare of industrial workers remains at exceptionally high peacetime levels as expressed in current activity in the government, in business management, in labor and in the medical and allied professions.

Public Relations

International Industrial Health—The first postwar International Industrial Health Congress will take place in London in the late summer of 1948. Steps have been taken to assure representation from the American Medical Association. Such representation is important because of widespread interest in industrial health practices in the United States. During the past months representatives from almost all European and Latin American countries and from China, India and Australia have visited outstanding installations in this country. All these visitors have been greatly interested in the activities of the Council on Industrial Health and the ways in which an independent medical organization has attempted to improve the health of workers through professional education, organization and cooperation.

Governmental Industrial Hygiene—Government support of industrial hygiene probably stands at the highest levels yet attained during peacetime, both in Washington, D. C., and in many industrial states. The Division of Industrial Hygiene in the U. S. Public Health Service is receiving excellent financial backing, which in turn is reflected in expanding field services, greater help to industrial hygiene bureaus in the states, resumption of laboratory investigations on an expanding and intensified basis and the development of a program of assistance to educational institutions for the training of essential industrial health personnel

Health Service for Federal Employees—Public Law 658 provides that government employees receive emergency treatment of on-the-job illness, preemployment and periodic health examinations, health counsel, referral to private physicians and dentists and a general program of preventive medicine. Surveys of health needs and available facilities have recently been completed in Denver, Kansas City and Chicago by the U. S. Public Health Service as required under this legislation. In each instance the investigation has been conducted after consultation with officers and appropriate committees of affected medical societies, who have been informed about the objectives of the program, the methods of survey and the final recommendations. For example, in Chicago thirty-two federal agencies employ 42,000 persons. The contemplated occupational health program will require thirteen physicians, six dentists, two or three engineers and seventy to eighty nurses working in one principal health center, two subsidiary centers and eighteen departmental health units. The total number of employees who may be affected by this law is indeterminate but may range from 2,500,000 to 4,000,000 persons.

Union-Sponsored Health and Welfare Programs—Growing concern by unions over the health of workers has been dramatized by the Welfare and Retirement Fund of the United Mine Workers of America. Actual and impending medical and hospitalization activities sponsored by unions or jointly supported and administered by labor and management will reach a substantial segment of the industrial population. Both the Council on Industrial Health and the Council on Medical Service have been keenly aware of these developments and their potential effect on medical services and relations.

The Welfare and Retirement Fund of the United Mine Workers continues to attract major interest because of the nature of financial support and the steps which have been taken to implement it. The appointment of a medical director, the selection of a Medical Advisory Board and the creation of a Health Services Division in the fund are successive steps already completed. The chairman and secretary of the Council on Industrial Health are both members of the Medical Advisory Board. The Health Services Division consists of physicians, dentists, nurses, statisticians and administrators. The main inspiration for activities largely springs from the famous Boone report, although separate and intensive studies have been made of individual union districts as a means for setting up pilot operations. The general intention has been to build on existing facilities and to improve rather than to replace them. Advice has been sought from all quarters having legitimate interest, particularly from government agencies, representatives of medical societies, health departments, voluntary medical service and hospitalization organizations and insurance companies. Considerable attention has been paid to rehabilitation during the period of negotiation between labor and the mine operators regarding activation of the fund. A number of badly neglected medical and surgical problems have been uncovered, and placed under the best available care.

Management Groups—The Chamber of Commerce of the United States has discontinued its Health Advisory Council, one of the subcommittees of which dealt with industrial health. A series of conferences has recently taken place between officers of that organization and the American Medical Association to see how health activity might be improved through proper working relations, especially in local communities. Since local chambers of commerce have demonstrated reliability in promotion and extension of good and dependable industrial health programs, every effort will be made to maintain satisfactory liaison.

Small Plant Programs—There are at present a dozen interesting experiments designed to bring to small industry the same kind of industrial health services which formerly only large industry has been able to support. These projects are being conducted by county medical societies, medical schools and individual physicians. Acceptance by small plants indicates that a definite and substantial need is being met. Some physicians have been concerned about their ethical status in promoting services of this kind to small industry. The Council on Industrial Health has felt that if these plans are well understood by county medical societies and the objectives accurately defined, no serious ethical relationship is involved.

Professional Relations

Field Activities—As usual, field services have been mainly pointed at improving the effectiveness of committees on industrial health in the state and county medical societies. There is still great variation in levels of accomplishment. Many are doing excellent work, others are not. Regional conferences have been held, generally in conjunction with the Council on Medical Service. These regional meetings have been attended by physicians, industrialists, labor leaders and others as a means of stimulating interest in industrial health at community levels.

Salaries of Industrial Physicians—Lack of adequate remuneration is regarded as one of the serious obstacles to attracting able and talented physicians into industrial health work. A study of salaries paid industrial physicians is now under way with the assistance of the Bureau of Medical Economic Research. The Council feels that industrial medicine should be taken off the bargain counter and that, given proper compensation, professional experience should be as stimulating and attractive in industrial medicine as in other medical specialties.

National Emergency Medical Service—Because of unsatisfactory experience in World War II regarding effective use of industrial physicians, nurses and ancillary professional groups, and because modern warfare depends on industry, it is believed that effective liaison should exist between the Council on Industrial Health and the Council on National Emergency Medical Service. Steps have been taken to bring about this desirable relationship.

Occupational Medicine—The headquarters personnel of the Council on Industrial Health are collaborating with the Editorial Board of *Occupational Medicine* in the preparation of general news and comments, book reviews, abstracts of current medical literature and the acquisition of original articles. It is also planned to develop an editorial program reflecting medical relations in industry.

Eighth Annual Congress on Industrial Health—The eighth Annual Congress on Industrial Health was held in Cleveland in January 1948, just preceding the scientific program of the Interim Session of the American Medical Association. The hope that in this way more general practitioners would be attracted to the Industrial Health Congress was not realized. In other ways the meeting was successful, particularly the annual dinner which was attended by the entire membership of the House of Delegates and the officers of the Association.

Scientific Development and Education

Survey of Industrial Medical Education—Nearly all medical schools in important industrial areas have been visited during the past year to determine the extent to which industrial medicine is taught to undergraduates and the facilities available for postgraduate training. In general the results of the survey are most encouraging.

Residency Approval—Regulations governing residencies and fellowships in occupational medicine were approved by the Council on Medical Education and Hospitals and the House of Delegates at the Annual Session in Atlantic City, N. J., in June 1947. Since that time application forms have been prepared and sent to industries likely to be in position to supply training and experience of residency caliber. Certain elements in the requirements for approval need clarification, and additional conferences will be held from time to time to make essential adjustments.

Research and Scientific Development—During the past year an effort has been made to collect all available information about existing facilities for research on industrial health and likely sources of financial and technical support. Investigations in industrial toxicology, industrial physiology and psychology, administrative methods and human engineering are expanding in number and importance. They occupy a prominent place in the research activities of the armed forces, government agencies and universities, as well as the industries themselves. There is great need for coordinating machinery. The Council on Industrial Health is strongly disposed to undertake an activity of this kind, assuming that it can be done reasonably. An alternative suggestion would concentrate this form of service in the National Research Council, although it is not clear that that organization is prepared to do it. Meanwhile, the headquarters office of the Council on Industrial Health acts as a general clearing house for information of this kind as well as for data on industrial medicine and health.

Atomic Energy—Cooperative efforts are being made by the Council on Physical Medicine and the Council on Industrial Health to appoint consultants familiar with the uses of atomic energy in medicine and industry. The safe production of this kind of energy, whether in the manufacture of radioactive isotopes or the ultimate successful development of nuclear fission as a source of usable power in manufacturing and transportation is on all counts the greatest single industrial health consideration at present.

Aluminum in Pneumoconiosis—The joint investigation of aluminum in the prevention and treatment of silicosis is being continued by the Council on Pharmacy and Chemistry and the Council on Industrial Health. A final report will appear shortly, descriptive of the kind of controlled experimentation necessary to determine the usefulness of this substance as a therapeutic and prophylactic agent.

Workmen's Compensation

The National Conference Committee on Workmen's Compensation previously mentioned in annual reports of the Council has been dissolved and its essential activities transferred to committees in the International Association of Industrial Accident Boards and Commissions. Meanwhile, to preserve important contacts developed through this Conference Committee, the Council has requested permission of the Board of Trustees to set up its own group of consultants on workmen's compensation. In this way dependable relations can be maintained with the legal, administrative, insurance and technical groups interested in workmen's compensation.

Rehabilitation

The Council has retained its contact with official agencies concerned with rehabilitation. It has worked closely with the Federal Office of Vocational Rehabilitation, and the program of the agency has been brought to the attention of members of the medical profession through direct mail, at the Annual Congress on Industrial Health and at regional conferences. Contact has been maintained along similar lines with the rehabilitation service of the Veterans Administration. Members of the Council serve in advisory capacities to both these groups. The gap between effective rehabilitation and the institution of definitive treatment of industrial accidents is a matter of great concern both to compensation and to rehabilitation workers. The Council has under consideration an educational program which will emphasize the need for far better integration of convalescent care and rehabilitation beginning as promptly as possible after the occurrence of an accident and continuing through the successive steps toward job restoration.

In 1945 Congress by joint resolution set aside the first week in October as National Employ the Physically Handicapped Week. Since then the President has appointed a committee to promote observance of this week. This committee is now sponsoring legislation which will make available $250,000 annually to be expended by the Secretary of Labor to promote the employment of handicapped persons and the work of the President's committee. There is serious concern that this amount of money will create an agency within the Labor Department that will duplicate services already available in the Federal Security Agency and the Veterans Administration. The Council is greatly interested in this proposal and will keep closely in touch with developments.

Council On National Emergency Medical Service

The House of Delegates of the American Medical Association at its Annual Session in June 1947 recommended to the Board of Trustees the creation of a standing committee of the Board to be known as the Council on National Emergency Medical Service. The Board of Trustees took the necessary action at its meeting on Sept. 4, 1947 to create this standing committee, and the following physicians were appointed to membership:

Dr. JAMES C. SARGENT, Milwaukee, Chairman.
Dr. RICHARD L. MEILING, Columbus, Ohio, Secretary.
Dr. WINCHELL McK. CRAIG, Rochester, Minn.
Dr. HAROLD S. DIEHL, Madison, Wis.
Dr. PERRIN H. LONG, Baltimore.
Dr. HAROLD C. LUETH, Lincoln, Neb.
Dr. STAFFORD L. WARREN, Los Angeles.
Dr. EDWARD L. BORTZ, Philadelphia. } Ex officio.
Dr. GEORGE F. LULL, Chicago. }

After several informal meetings of the Chairman, Secretary and others, the Council on National Emergency Medical Service held its organization meeting at Association headquarters in Chicago Dec. 11, 1947.

Organization

The Council is to act as a committee of the whole during regular semiannual meetings to be held during the first week in November and the first week in April. The Chairman is empowered to call special meetings if and when required. Between semiannual meetings the executive committee is to act in behalf of and for the Council, holding such meetings as may be required. The executive committee is composed of the Chairman, the Secretary, the ex officio members and one other member appointed by the Chairman for a period of one year.

The following subcommittees for the purpose of study of specific problems have been appointed by the Chairman: (1) Allied Health Agencies; (2) Professional and Lay Education on Special Weapons; (3) National Disaster Relief; (4) American Medical Association Directory Service for Emergency Use; (5) Regional and State Subcouncils, and (6) Scientific Exhibit.

The Council, with the sanction of the Board of Trustees, plans to meet with and to consult with the various agencies of the National Military Establishment as well as such other agencies, organizations and persons as may be interested in national defense.

Consultants

The following physicians have been appointed to serve as Consultants to the Council: Dr. James E. Paullin; Dr. Hugh J. Morgan; Dr. Hans H.F. Reese, and Dr. George M. Lyon.

Purpose

The purpose of the Council on National Emergency Medical Service is conceived to be the development of proper, logical and timely advice for presentation to the Board of Trustees of the American Medical Association with reference to the medical and associated problems involved in the mobilization of the nation's armed forces, industry, agriculture and civilian population in time of a national emergency. It is necessary, therefore, to make a continuous, planned and coordinated study of the numerous problems associated with the mobilization of the nation's manpower, resources and materials, and to maintain direct and continuous contact with other civilian and governmental medical and allied organizations and agencies as well as with those agencies and organizations involved or responsible for the planning and operation of the national defense in its broadest term.

Scope

An outline of the scope of the Council on National Emergency Medical Service follows:

1. National Defense Planning related to medical, health and sanitary services:
   (a) Armed Forces:
      (1) Medical personnel procurement program
      (2) Reserve program in Army, Navy and Air Forces
      (3) Medical officer ratio to military strength
      (4) Industrial College of the Armed Forces planning
      (5) Utilization of available hospital facilities in time of national emergency
   (b) Civilian Population:
      (1) General medical and health care of urban and rural population
      (2) Medical and health problems in industry
      (3) Consideration of medical education, research and special groups
      (4) Plans for production, stockpiling and allocation of medical material and supplies
2. Liaison and joint planning with allied medical and health agencies regarding personnel, facilities and material required in time of national emergency
3. Distribution of medical and allied personnel in an all-out national emergency
4. Plan for national disaster relief program
5. Program of education with reference to the special weapon type of warfare (atomic bombs, rockets, bacteriologic warfare, chemical warfare, etc.)
6. Coordination with councils, committees and agencies of the American Medical Association for planned unified action in time of national emergency

Public Relations

All planned publicity and policy releases of the Council are channeled through the office of the Secretary and General Manager of the Association.

Activities

On Jan. 6 and 7, 1948, the executive committee of the Council held conferences in Washington, D.C., with the Secretary of Defense, the Chairman of the National Security Resources Board, the Secretary of the Navy and the Secretary of the Air Forces.

In response to invitations by the Council, representatives of the Departments of the Army, Navy and Air Force and of the Office of Selective Service participated in the regular autumn meeting of the Council held at Association headquarters Dec. 11, 1947.

The Subcommittee on Allied Health Agencies stimulated a survey of the medical colleges of the United States on the part of the Association of American Medical Colleges and the Council on Medical Education and Hospitals to evaluate the various proposals for increasing the enrolment of medical students in time of peace and in time of emergency.

The Subcommittee on Professional and Lay Education on Special Weapons proposed to the Atomic Energy Commission and to the Secretary of Defense the training by observation of a select group of physicians chosen from metropolitan and strategic areas in the medical aspects of the use of atomic weapons.

The Subcommittee on National Disaster Relief conducted a poll of the governors of the forty-eight states and of the territories with regard to the present status of the state disaster service in each state. At the same time the respective state medical associations were advised of the action taken.

The executive committee of the Council has prepared an answer to a request of the Committee on Civilian Components, Office of the Secretary of Defense, for "the views of the American Medical Association on the subject of the organization and training of the civilian components of the Army, Navy and Air Force."

Spring Semiannual Meeting

The regular spring semiannual meeting of the Council was held in Chicago April 5 and 6, 1948. This meeting, falling as it did at a time of great public and professional concern over the deteriorating international situation, was of great importance, and many of the general officers, members of the Board of Trustees and directors of Councils and Bureaus of the Association participated. Representatives also were invited and appeared from thirteen national allied medical and health organizations.

The meeting was devoted to three half-day panel discussions followed by a final half-day business session, which was open to and was attended by a large number of the state associations' representatives. There were panel discussions on medical aspects of special weapons warfare; civilian medical, health and sanitary problems in a national emergency and the programs of governmental and civilian agencies to meet them, and medical, health and sanitary problems of the military establishment in the event of a national emergency. The panels were participated in by members of the Council and representatives of the Veterans Administration, the National Academy of Sciences, the Society of Medical Consultants of World War II, the American National Red Cross, the National Security Resources Board, the Departments of the Army, Navy and Air Force, the U.S. Public Health Service and the Office of Selective Service Records.

The proposed program of the Office of Selective Service Records, outlined before the Council, includes plans to revive the medical examination of inductees at draft board level much as prevailed throughout World War II. Since this program is intended to prevail under peacetime operation of the proposed Universal Military Training law and fails to carry a provision for remuneration to physicians who serve the local examining boards, the Council believes that there should be a determination of the policy of the American Medical Association on the question of remuneration for medical examinations at Draft Board level.

In the course of the semiannual meeting an informal conference was held with representatives from the thirteen national medical and health organizations that had been invited to participate. Much discussion centered about the many phases of national defense of common interest to these organizations and about the need for cooperative planning and joint action. The council favors the establishment of a liaison agency for joint national defense planning by and between the American Medical Association and the Advisory Board for Medical Specialties, American College of Physicians, American College of Surgeons, American Dental Association, American Hospital Association, Catholic Hospital Association, American Protestant Hospital Association, American Nurses Association, American Pharmaceutical Association, American Public Health Association, American Veterinary Medical Association and Association of American Medical Colleges.

The National Security Act of 1947 was enacted shortly after the House of Delegates approved the creation of the Council on National Emergency Medical Service in June 1947. The act provides for the establishment of a National Security Resources Board to consist of certain stipulated cabinet members together with heads of federal departments and agencies to be added at the option of the President, the board to be charged with the mission of advising the President regarding the coordination of military, industrial and civilian mobilization. The Departments of the Army, Navy and Air Force have suggested the establishment of a National Emergency Medical Board as an agency of the National Security Resources Board to include representation from the American Medical Association; the Council on National Emergency Medical Service urges that all possible effort be expended by the Association, including the immediate enlistment of the efforts of other medical and health organizations, to the end that such a National Emergency Medical Agency be appointed within the structure of the National Security Resources Board.

The Council was informed at its meeting in April that the director of the Civil Defense Sector of the Office of the Secretary of Defense will in the immediate future appoint a medical advisor and desires that this advisor be provided with both military and civilian medical consultants, one of whom would represent the American Medical Association. The Council recommends that early consideration be given to the selection of an appropriate representative.

A bill dated April 3, 1948 to provide for the common defense by increasing the strength of the armed forces of the United States and for a universal military training program is at present before the Senate Committee on Armed Services. In making special provision for the drafting of physicians up to the age of 45 years this bill, in the opinion of the Council, proposes a type of legislation that is on its face highly discriminatory and coercive if not actually unconstitutional. The Council believes that the recent wartime requirements of medical military personnel were met promptly and more than adequately by the patriotic response of the members of the medical profession without the necessity of any such compulsive legislation and that the experience of the recent war years served to bring into sharp focus the great danger that would lie in investing in the military establishment, rather than in a proper civilian board, the important functions of determining the relative needs of the military establishment and the civilian population and of distributing the limited medical manpower of the nation to meet those needs in time of war or the threat of war. It is therefore the considered opinion of the Council on National Emergency Medical Service that immediate action should be taken committing the

American Medical Association in opposition to Title I Sec. 105 (0) of the proposed bill, and that all possible effort should be expended, including the immediate enlisting of the efforts of the American Dental Association and all other organizations vitally interested in the nation's health, to expunge such discriminatory elements from this or any other proposed legislation relating to the drafting of the medical manpower of the nation for military purposes.

Through its conferences and deliberations, the Council on National Emergency Medical Service has arrived at certain conclusions which it believes might be accepted as basic principles to govern the American Medical Association and all who represent it in the medical, health and sanitary aspects of national defense and the expansion of the military establishment under the threat of a national emergency. These principles are:

1. The medical manpower of the United States is a resource vital to the life of every man, woman and child in the nation. It is a resource fixed in quantity beyond the possibility of rapid expansion.

The services of physicians must be carefully conserved and judiciously allocated in time of war to insure adequate medical, health and sanitary care for all Americans, whether in or out of uniform.

2. An extremely broad and painstaking survey of the use made of medical manpower within the military establishment during World War II revealed a substantial overprocurement of civilian physicians by the military establishment. Call-up to duty long in advance of need, the medical overstaffing of units, prolonged periods of complete inactivity in pooling areas and inordinate delay in separation from service are wasteful of medical talent and can be greatly minimized by improved logistics, by air and other rapid transport and by more fluid interchange of medical officer personnel between branches of the service. Protracted military indoctrination and assignments to strictly nonmedical duty should be completely eliminated.

Substantial reduction in the medical personnel requirements of the armed forces over that employed in World War II can be accomplished and medical health and sanitary care of the services actually improved by better use of the medical talents of medical officers.

3. Great wastage of medical talent is involved in duplicating the physical examination of inductees at the draft board and recruiting centers and again in reception centers.

A single physical examination of recruits and inductees should be made to suffice.

4. In the light of the experience of those countries suffering the effects of serious bombing during the last war and giving heed to the threat of the atom bomb, the need of planning adequately for the medical health and sanitary care of the civilian population becomes a matter of first magnitude since the very life of the nation may hinge on it.

It would be completely unsafe and a serious threat to our national war effort to lower needlessly the ratio of physicians to civil population anything like the 1 to 1,500 ratio reached during the recent war.

5. The making of a physician requires long, unbroken years of instruction and training. The periodic annual graduation of the usual class of new physicians could not be allowed to pass a year or two without seriously threatening the national health for a generation. Especially is this true if war is to deplete the ranks of the profession.

The deferment of properly selected and duly registered premedical and medical students together with a staff of essential teachers is absolutely necessary to the future health of the nation. The same holds true for scientists engaged in important medical and allied research.

6. The present civilian medical component procurement programs of the several branches of the military establishment are highly competitive, closely confined to areas of medical teaching and research and completely unrelated to one another or to the need for deferment from military duty of the personnel they seek to enlist.

There is great need for interservice coordination in the procurement of reserve medical officers and for avoiding recruitment among essential teaching and research personnel.

7. In the event of war or the threat of war requiring medical personnel in numbers beyond those voluntarily enlisting, whatever the program of procurement of additional physicians may be, that program should in all fairness take into account the obligation that students, deferred and taught at public expense during the recent war years, have to their government and it should take into account the sacrifices already made by those physicians who served during the recent war.

Except as age, infirmity or absolute irreplaceability may forbid, the call to military duty should be in the following order of priority:

(a) Those recent graduates who were enrolled in A.S.T.P. or V-12 programs who have not completed their obligated tours of duty as medical officers and all others who were deferred by Selective Service to continue their medical education; (b) other physicians who did not serve in World War II, and (c) those physicians who served the least in World War II.

8. During the recent war many physicians were required to spend four, five and six years of their lives separated from their families and completely dislocated from their practice. At the same time many able bodied physicians without important reason to be excused from service remained at home to reap the rich harvest of an expanded practice.

In the event of war or threatened war requiring the procurement by the Military Establishment of medical officers from civilian life, provision should be made for their replacement after a reasonable tour of active duty by others from civilian life.

9. Within the limits of administrative possibilities, civilian physicians drawn into the Military Establishment should be rotated between combat and rear areas in an equitable manner.

Bureau of Health Education

The year 1947 was anticipated as a postwar year when many of the difficulties due to war might reasonably be expected to have been overcome. Actually it was one of the most difficult years the Bureau of Health Education ever has experienced.

Personnel

The greatest difficulty experienced during the year was the personnel problem. To fill the vacancies which occurred during 1947 it was necessary to obtain twenty-four new employees, of whom sixteen left during the year. In addition to a ruinous turnover, which implies frequent and prolonged vacancies and much loss of time training new employees, it was necessary to replace one full time man with two college boys, each working half time. All this has greatly handicapped the work of the Bureau and thrown a severe burden on the steady and reliable employees.

The Director of the Bureau was the recipient of the 1947 Elisabeth Severance Prentiss Award for Outstanding Achievements in Health Education, given annually by the Cleveland Health Museum. The award was presented at the annual civic luncheon of the Museum at Cleveland, Nov. 17, 1947. The award consists of a bronze plaque and a certificate. The presentation and response were broadcast on a nationwide network of the Mutual Broadcasting System.

Bureau Publications

The Bureau reviewed twenty-four books for THE JOURNAL and twenty-one for *Hygeia*, and prepared thirty-two other contributions to THE JOURNAL in the form of editorials, radio announcements, articles and news items, as well as seventy-four for *Hygeia* such as manuscripts, questions and answers, items for Mothers' Column and for Teachers' Helps. Eight news items were submitted for the Secretary's letter.

The Bureau originated forty-two articles which were published in periodicals other than those of the American Medical Association. Advice and consultation on manuscripts was furnished five organizatoins.

Radio

The year 1947 marked the greatest activity of the Association in radio and was notable for a fundamental change in policy.

Network Programs—In addition to the usual network broadcasts on the National Broadcasting Company, the Association provided for two additional network programs, one on the Mutual Broadcasting System and the other on the American Broadcasting Company. The American Broadcasting Company negotiations failed, but a program was established with Mutual, opening February 17 and continuing past the end of 1947.

The Mutual Broadcasting System program, "Stephen Graham, Family Doctor" was broadcast on Sundays at 2 p. m. Eastern standard time during most of its run. Despite the fact that it was a program of high quality and broadcast at a relatively favorable hour, it attracted little audience mail and relatively little comment which was relayed back to the office. When the original twenty-six weeks ran out, the program was extended another thirteen weeks by use of the funds intended for the American Broadcasting Company broadcast, which meanwhile had failed to materialize.

The fundamental change in Association policy consisted in making the network broadcasts of the Association available for commercial sponsorship. Following is the list of acceptable sponsors:

1. Automobile manufacturers, dealers or trade associations.
2. Oil and gasoline manufacturers, dealers or trade associations.
3. Furniture manufacturers, dealers or associations.
4. General merchandising organizations, exclusive of foods, drugs or cosmetics.
5. Life insurance companies or associations.
6. Lumber and building supply companies or associations.
7. Railroad, aviation, bus, steamship or other transportation associations or companies.
8. Book publishers, particularly of medical books.
9. Builders, contractors and building material organizations.
10. Trade associations, not specifically named, except those having to do with food, drugs, cosmetics, pharmaceuticals, biological or surgical supplies, tobacco, alcohol or finance.
11. Accident, health, fidelity and other insurance agencies, companies or associations.

The authorization for commercial sponsorship came when the National Broadcasting Company series was almost finished. The Mutual series was extended thirteen weeks by the Association and six additional weeks by Mutual in the hope of making a sale. It appears, however, that selling the American Medical Association program is not going to be simple. The sponsors with a natural interest in the program are excluded for policy reasons, since it seems inadvisable to enter into a commercial radio agreement with any commercial organization whose products or services might come before any of the Association's scientific councils for acceptance, review or criticism. Many of the most desirable sponsors, from the point of view of the Association, have existing radio contracts which will not soon be terminated.

Radio Transcriptions—The electrical transcription activity now grows without stimulation. The large number of broadcasts indicates the interest taken by local agencies in the platter service. During 1947 the American Federation of Musicians announced the termination of musicians' services for recordings as of Dec. 31, 1947. This necessitated the making of a series with music in December which normally would have been made in 1948. The "Radio Handbook" produced in 1946 has had wide distribution and is proving exceedingly useful.

Special Broadcasts—Under the direction of the Bureau of Health Education, eight network programs connected with the Centennial Celebration of the American Medical Association at Atlantic City, N. J., were broadcast during the week June 7 to 14. Great interest was evidenced in the Centennial religious observance program broadcast over the National Broadcasting Company's network on Sunday, June 8, by Msgr. Fulton J. Sheen, Rabbi Joshua Loth Liebman and Dr. Ralph C. Hutchison. A reprint containing the three sermons was made available by the Bureau of Health Education in response to numerous requests. The sermons were also made available on phonograph records in an album, of which twenty sets were distributed in 1947.

Three radio programs were broadcast by staff members of the Bureau in local areas where they attended meetings.

Special Award—At the seventeenth Institute for Radio in Education held at Ohio State University the eleventh American Exhibition of Education Radio Programs was sponsored. The American Medical Association program, "Doctors, Then and Now," received the first award in its classification, Broadcasts by National Agencies. A previous Institute awarded a similar honor to the American Medical Association—National Broadcasting Company program, "To America's Schools—Your Health," in 1938.

Television

This health education activity of the Bureau was continued with resumption of program presentation in the late fall of 1947. During the summer, a "Television Handbook" was prepared and issued by the Bureau. In this the possibilities of television as a medium for health education were considered and twenty-eight programs presented by the Bureau were summarized. On resumption of this activity, weekly presentations were inaugurated in place of the original once-every-two-weeks plan. During 1947 the majority of the programs were in the nature of "spot" news presentations. Material for these was taken from the weekly clip sheet published by the Association. The technic involved utilization of an appropriate film background for orientation of the viewing audience. In some instances sound films were used, while in others special scripts were prepared to be read over the silent film. This was given added variety by introduction of discussion between the television master of ceremonies and a physician to simplify as much as possible the technical aspects of the medical subject. Included among subjects presented in this way were rabies, anthrax, cancer, brucellosis, cost of medical care, child health care and the plight of the Navajo Indians.

Hygeia Loan Collections

A further slight increase in requests for *Hygeia* loan collections prepared by the Bureau of Health Education was observed. Eighty-seven such collections were sent out during the year as compared with eighty-two in the previous year. During the year the entire set of loan collections, dealing with fifty-five different health education subjects, was revised and reorganized extensively. The trend away from physician utilization of this service was reversed in 1947. Requests for loan collections came from fifty-eight physicians, whereas only thirty-eight physicians employed these in 1946. This can be construed as encouraging evidence that local civic organizations are recognizing more fully the importance of the physician as a source of reliable health information for the general public. Twenty-one requests came from lay persons working in the field of health education, and eight were received from nurses. The loan collections were sent to twenty-five different states and to Canada. Subjects most in demand were outstanding medical advances, cancer, alcohol and tobacco, progress in preventive medicine and sex education.

Health and Fitness

The end of 1947 marks the first full year of operation of the Health and Fitness Division within the Bureau of Health Education. The establishment of this work as an integral part of the functions of the Bureau of Health Education was an added step forward in the efforts of the American Medical Association to contribute to the promotion of health.

While the Division has been concerned with health and fitness problems of the preschool child, the school child, college students and adults, it has become increasingly evident that the most productive avenue of approach is to be found in working with those groups concerned with the health and fitness of the school child. The source file which was prepared as one of the first assignments of the Consultants, Drs. Dean F. Smiley and Fred V. Hein, has continued to grow and develop. Many organizations and agencies, including state departments of education and state departments of health, are now making it a regular policy to send copies of new materials to the Division to replace those within the files of the Bureau.

Correspondence related to problems in the development and expansion of health and physical education now comes regularly to the Division from nearly all the states. A considerable portion of the Consultants' time is required to answer such inquiries and to review materials concerned with curriculum planning and program development in the areas of school health and physical education.

A series of "Suggested Discussion Topics for Teacher Aids" to accompany each issue of *Hygeia* are prepared. These materials are being widely utilized in connection with the use of *Hygeia*, The Health Magazine, as a source aid for health education in the secondary schools. A considerable number of films and other audiovisual aids for use in school health and physical education instruction are reviewed.

Legislation relative to school health and physical education was studied and the proper department of the Association advised in regard to the nature and content of projected bills. With the approval of the Board of Trustees, the Consultants have participated in the work of many committees as members or otherwise.

A series of thirteen radio transcriptions on health and fitness under the title, "That Wonderful Feeling," prepared late in 1946 is continuing to be widely used by state and local medical societies and other groups having the approval of the medical society. Three television programs on health and physical education were broadcast over station WBKB during the year. A brochure entitled "Teacher Aids" for use in connection with the "Health Heroes" series—transcribed radio programs—was prepared. Over a thousand copies have been distributed, and the material is being used in a comprehensive statewide program in Tennessee.

The Consultants participated in working sessions, gave talks at health and physical education conferences or other group meetings in twenty states during the year. These meetings included those of state and local departments of health, medical societies, education departments, medical auxiliaries and combined meetings of these and other groups. In October a Conference on the Cooperation of the Physician in the School Health and Physical Education Program was held at the Moraine Hotel, Highland Park, Ill. State departments of education, state departments of health, state education associations, state medical associations and national voluntary health agencies were invited to send delegates to the meeting. One hundred and twenty participants, representative of some ninety agencies or organizations, came from thirty of the states and one of the territories to attend the Conference. Twenty-six consultants drawn from the fields of public health and public education and the professions of medicine and education acted as discussion leaders. The purposes of the Conference were (1) to develop plans for implementing within the various states the health service provisions of the report, "Suggested School Health Policies," made in 1945 by the National Conference for Cooperation in Health Education; (2) to provide for interchange of information regarding the patterns of school health programs and the results of school health studies being carried on in various states; (3) to define the role of the physician in relation to the health aspects of school physical education and athletics, and (4) to suggest practical methods for providing preservice and inservice education programs for school health personnel. It was judged desirable to direct the work of the Conference to pointing up practical ways and means of carrying out recommended policies at state and local levels.

Drs. Smiley and Hein contributed material to the revised edition of "Health Education" published by the Joint Committee on Health Problems in Education of the National Education Association and the American Medical Association and also edited the manual "Health Appraisal of School Children". Dr. Smiley has been appointed to membership on the Joint Committee and elected as Secretary for the coming year. The report of the Highland Park Conference entitled "Physicians and Schools" is now in print. Numerous requests and orders for the printed report are being received.

A heavy schedule of engagements for participation as discussion leaders at state school conferences and regional conferences has been developed running through October 1948. Because of the schedules undertaken and the limited time available, some invitations to participate in similar meetings have had to be refused. It appears wise at this time that the Consultants direct their limited efforts in this vast field of health and fitness to those areas where there is already organization which will make possible the most direct and immediate action. Through school and college contacts almost one third of the population can be directly influenced. At this level the work is especially fruitful, since the groups concerned will include the future parents and community leaders.

Pamphlets

Fifty-three new pamphlets were added during the year to the Bureau's list of publications, ten were completely revised and redesigned, twelve were revised in text and sixteen were discontinued. Distribution of Bureau publications through the Order Department was 256,725, and 46,450 reprints were sold directly to quantity purchasers, making a total of 303,175.

Before being reordered, each pamphlet is evaluated and then discontinued or revised, as recommended. For example, all five of the popular sex education pamphlets by Dr. Thurman B. Rice were revised. Two mental hygienists at the University of Illinois were appointed to review this popular series of sex education articles. The Bureau then coordinated the resultant suggestions with the author's comments and recommendations for the next edition of each pamphlet.

Art work in the pamphlets was increased, both in those recommended for reorder and for new pamphlets, and typography was modified in accord with modern trends.

Bureau of Investigation

During 1947 the Bureau of Investigation continued to function in a fact-finding capacity and in the dissemination to interested persons and groups of information on "patent medicines" and quacks, on fads and faddists and on frauds, either of a medicinal or a cosmetic nature. Inquiries regarding cosmetics, however, were turned over during the latter part of the year to the secretary of the Committee on Cosmetics of the Council on Pharmacy and Chemistry.

On July 2, 1947 Mr. Bliss O. Halling, Acting Director of the Bureau, died suddenly. He had been assistant director from 1914 to 1942, except for the period when he served his country in the first World War. His position was not filled during the year. The work was, however, carried on by the clerical force under the guidance of Dr. Austin Smith, Secretary of the Council and Pharmacy and Chemistry. On Jan. 1, 1948 Mr. Oliver Field assumed direction of the Bureau. Plans are being formulated to expand the *reporting functions, with the idea that this will result in increased use of the informational facilities.*

Inquiries

Statistically, the Bureau performed in much the same manner as in the previous year. Approximately 3,400 letters covering 4,500 subjects, representing a slight gain over 1946, were answered.

The number of inquiries was about evenly divided as between physicians and laymen. Others included inquiries from better business bureaus, newspapers and periodicals, radio stations, governmental agencies, students and teachers. The ten subjects most often inquired about during 1947 were hair preparations, "obesity cures," cosmetics, "cancer cures," "diabetes cures," "aspirin," laxatives, vitamin preparations, "headache cures" and habit-forming agents.

The compilation of facts on persons and products is augmented to a certain extent by some of these inquiries. The Bureau constantly seeks authentic data on new preparations, new promotions, new departures from the field of ethical practice and new approaches by known charlatans in their appeals to ailing persons. Details of encounters with licensing or other regulatory officials on the part of such charlatans, which at times may be regarded as local news, are always welcomed.

Lay persons who believe they have "cures" for serious ailments frequently write the Bureau. During the year many such persons were informed of conditions imposed before consideration can be afforded such "cures." It is interesting to note that none ever supplies the evidence requested.

Cooperation With Other Agencies

During the year there was much cooperative effort in the exchange of information on nostrums, fakes, therapeutically useless devices and other items of mutual interest with the better business bureaus and state and federal regulatory agencies having jurisdiction in such matters. Considerable assistance was given, also, to feature writers in furnishing material for magazine articles on quacks and nostrums. Much time was spent with advertising officials of newspapers and radio stations and others who requested information and criticism of "patent medicine" advertising before acceptance for publication in the press or for broadcast purposes.

Contributions to the Journal

In 1947 twelve columns of material were contributed to The Journal by the Bureau of Investigation. For the most part, the contributions included reports of regulatory actions by governmental agencies, particularly the Food and Drug Administration, the Federal Trade Commission and the Post Office Department, against persons and firms exploiting drug products without regard for the truth of the claims made.

Other Services

The Bureau's lantern slides and film strip dealing with the nostrum evil and quackery were still available to physicians and educators who might desire to use them. However, demand for these items appears to have decreased.

The Bureau seeks to widen its facilities in the matter of furnishing propaganda on quacks and nostrums. Members of the profession particularly, and the general public as well, are invited to use the constantly increasing sources of information and facts that have accumulated in the files of the Bureau. Physicians are urged to suggest to science teachers and others that the Bureau can assist them in furnishing facts for school or lecture use.

Bureau of Legal Medicine and Legislation

Since the last report of the Bureau of Legal Medicine and Legislation was submitted, one member of the staff, Mr. T. V. McDavitt, has been transferred to the Bureau of Industrial and Personnel Relations and the services of Mr. E. J. Holman have been secured as a replacement. Mr. Holman is a member of the Bar of the State of Kansas, a former member of the legislature of that state and a former judge of the City Court of Leavenworth, Kansas.

For a number of years there has been unnecessary duplication in the contents of the report of the Bureau and that of the Washington Office of the Council on Medical Service. Both have presented factual analyses of federal legislation of medical concern, resulting not only in a duplication but having a tendency to confusion, because the two reports have not always been considered by the same reference committee of the House of Delegates. After discussing the matter with the Secretary and General Manager, and with his concurrence, this report of the Bureau and future reports will omit the routine, detailed and factual analyses of medical bills in Congress, leaving such analyses to be presented in the report of the Washington Office of the Council. The Bureau will, however, submit special comments on particular developments in Congress as the occasion seems to justify.

Local Public Health Units

The House of Delegates has recorded its approval of federal aid to assist the states in the development of local health units. During 1947, several drafts of legislation were prepared for the Association of State and Territorial Health Officers anticipatory to the introduction in Congress of a bill to assist the several states in the development and maintenance of local health units organized to provide basic full time public health services and to assist the states in the training of personnel for local health unit work. In the fall of 1947 a draft of this legislation was considered by the National Congress of Parents and Teachers at a meeting held in Washington, D. C. Following this consideration, the draft was approved by that organization. At this same meeting, that association adopted resolutions committing itself to a vigorous campaign to promote the enactment of the legislation. The National Congress of Parents and Teachers has appealed to the American Medical Association for its support.

On February 20, Senator Saltonstall, of Massachusetts, for himself and for Senator Cordon, Oregon, and Senator Hill, Alabama, introduced bill S. 2189 based on the draft prepared for the Association of State and Territorial Health Officers and approved by the National Congress of Parents and Teachers. To the extent that this bill will provide federal aid in the development of local health units, it conforms to the policies adopted by the House of Delegates. It would authorize the appropriation annually of as much federal money as is necessary, which will be allotted to the several states that have developed plans and submitted them to the Surgeon General of the United States Public Health Service for his approval. Attention should be directed, however, to the fact that the bill as now phrased gives no assurance that the local health departments to be developed under it will not provide care for the sick. A local public health unit within the meaning of the bill is defined to mean a governmental authority of a local area authorized to provide in such area "basic public health services." (Sec.(3) (d). Another section of the bill, Section 5 (b)(4), permits the Surgeon General of the Public Health Service by regulation to prescribe the "types of health services" which shall be considered basic public health services. Before taking this action, the Surgeon General will be required to consult with a conference of state health officers, but he is not required to accept the recommendations of such state officials. It is entirely within the realm of possibility, therefore, that the Surgeon General might define public health services in such a way as to embrace personal health services other than preventive. Such broad authority should not devolve on a federal administrative officer, and the bill itself should define what shall constitute such services.

Dr. Haven Emerson, chairman, Subcommittee on Local Health Units, Committee on Administrative Practice, American Public Health Association, has stated that the six basic functions of a local health department include:

1. Vital statistics, or the recording, tabulation, interpretation and publication of the essential facts of births, deaths, and reportable diseases.
2. Control of communicable diseases, including tuberculosis, the venereal diseases, malaria, and hookworm.
3. Environmental sanitation, including supervision of milk and milk products, food processing and public eating places, and maintenance of sanitary conditions of employment.
4. Public Health laboratory services.
5. Hygiene of maternity, infancy and childhood, including supervision of the health of the school child.
6. Health education of the general public as far as not covered by the functions of departments of education.

If S. 2189 were ammended by adding a definition "basic public health services" to include the foregoing functions and to exclude "the care of the sick" as a function except when that care is necessary for the protection of the health of the community, the legislation would in principle, it would seem, conform to the policies adopted by the Association and would merit its support.

Inequities in Income Structure
Pension Plans for Physicians

There is a growing concern over a number of inequities in the federal income tax structure affecting taxpayers engaged in a business or profession as sole proprietors or as partners.

1. It has been pointed out that it is possible for a taxpayer who operates a corporate business "to set aside in his years of productive activity to meet his requirements in the closing years of life. In most cases, he need only draw enough from the business to cover his personal living expenses plus personal income tax. The rest of the business earnings are subject to a corporate tax rate ranging from 21 per cent to 38 per cent, depending on the amount of earnings. This fairly modest tax is to be contrasted with individual income taxes which are payable under graduated rates attaining approximately 53 per cent at $20,000, 60 per cent at $30,000, 68 per cent at $40,000, and 84 per cent at $100,000."

It is not possible for certain groups, such as physicians, lawyers and dentists, to practice as corporations; hence, such groups are subject to the higher tax rates. It has been suggested that the Internal Revenue Code be ammended to permit, in effect, these groups to take advantage of the lower corporate rates with regard to income derived from practice as distinguished from income derived from investment. This proposal has been referred to as the "Bard plan" and is now before the Eightieth Congress in the form of a bill introduced by Representative Church, of Illinois, as H. R. 5143.

2. Under the pension trust provisions of the Internal Revenue Code, a corporation within certain limitations may deduct in the computation of its federal income taxes sums expended in establishing a pension program for officers and employees. A partnership is accorded a similar privilege as far as employees are concerned, but the cost of a partnership pension program for the partners themselves is not deductible. Nor can a taxpayer in unincorporated business for himself set up a program to provide old age security after his productive years are spent and deduct the cost of it.

A proposal is being discussed for an amendment or amendments to the Internal Revenue Code to eliminate this inequity. No bill has as yet been introduced in Congress to put into effect this proposal.

3. A third suggestion has been offered which has become known as the "Silverson plan." This in effect will permit the taxpayer to purchase special government bonds up to a specified amount each year and deduct the cost in computing his federal income taxes. These bonds would be nonnegotiable and would be subject to redemption either at any time after the attainment by the taxpayer of age 60 or at any time after the death of the taxpayer and would be subject to income tax when redeemed.

These proposals have been discussed over a period of years with representatives of the American Bar Association and other national organizations and with the chief of staff of the Joint Committee on Internal Revenue Taxation. More recently, the Association of the Bar of the City of New York invited representatives of a number of national and state organizations to attend a conference in New York to explore further the desirability of proposing the suggested amendment. The invitation to the American Medical Association was received too late to permit its acceptance, but a second conference was called in February 1948 which was attended by the Director of the Bureau of Legal Medicine and Legislation and the Director of the Bureau of Medical Economic Research. Other meetings will be scheduled in the near future.

The Board of Trustees has recorded its approval in principle of the proposal that physicians practicing as sole proprietors or as partners be permitted, with deduction of costs in computing income taxes, to formulate pension programs for themselves, provided a reasonable ceiling be placed on the amount of pension. *It is recommended that the House* of Delegates voice a similar approval.

At its February midwinter session held in Chicago, the house of delegates of the American Bar Association, after referring to the tax inequities now faced by partners and sole proprietors in the matter of pension and other retirement plans, passed the following resolution:

> "RESOLVED, that the American Bar Association authorizes and directs the Section of Corporation, Banking and Mercantile Law and the Section of Taxation to study the subject and recommend a definite proposal or proposals to this Association, as soon as practicable."

The Bureau will contine to keep in close contact with this development, because it seems to have considerable merit.

Epilepsy and Automobile Accidents
The Drunken Driver

At the Annual Session of the American Medical Association held at Kansas City, Mo., in 1936, the House of Delegates authorized the appointment of a Committee to Study Problems of Motor Vehicle Accidents. Such a Committee was appointed by the Board of Trustees and has functioned since that time in close cooperation with the National Safety Council and other agencies concerned with the prevention of accidents of this type. It has concerned itself, in the main, with the relation of the drunken driver to automobile accidents and has submitted a number of recommendations which have been approved by the House of Delegates. In its 1942 report to the House, the Committee did state that the presence of epilepsy should be sufficient reason for denying a license to a driver and that for practical purposes any person having a permanent condition which may cause temporary unconsciousness should be included in this category.

Prior to 1947, there were laws in only two states, California and New Jersey, requiring the reporting of epilepsy to motor vehicle departments. During the legislative year of 1947, legislation patterned closely after the California law was introduced in Indiana, Iowa, Kansas, Oregon and Wisconsin. It was enacted in Indiana, Iowa, Oregon and Wisconsin.

Correspondence by the Bureau with the American Association of Motor Vehicle Administrators last fall disclosed the fact that that association at its then last annual conference passed a resolution advocating the compulsory reporting of epilepsy. Copies of this resolution were sent to all member states with a copy of the California law, which was suggested as a model. The California law, in brief, requires all physicians to report to the local health officer in writing the name, age and address of every person who has a condition diagnosed as epilepsy or a similar disorder characterized by lapses of consciousness. The local health officer must report in writing to the state department of public health the name, age and address of every person reported to it as epileptic. The state department of public health is then required to report to the state department of motor vehicles the names, ages and addresses of all persons reported as having epilepsy by the physicians and local health officers. Such reports are declared to be for the information of the State Department of Motor Vehicles in enforcing the provisions of the Vehicle Code of California and must be kept confidential and used solely for the purpose of determining the eligibility of any person to operate a motor vehicle on the highways of California.

The laws that have been enacted follow the California pattern in authorizing the state department of health to define the term epilepsy. The most recent definition that has come to the attention of the Bureau was formulated by the State Board of Health of Wisconsin and reads as follows: "An affection of the nervous system characterized by attacks of unconsciousness with or without convulsions." Unfortunately, there do not seem to be any dependable statistics indicating the relation between epilepsy and automobile accidents as compared with such accidents caused by other conditions, such as heart disease and cerebral hemorrhages. In at least two of the states in which legislation of this type has been enacted, California and Indiana, the action of the legislature followed an accident that was a tragedy in one instance, several persons being killed, and that resulted in a near tragedy in the other case.

It has been questioned whether a state department of health should be required to transmit to a motor vehicle department every report of epilepsy received despite the fact that some of the afflicted persons may not be eligible or applying for a driver's permit. As an alternative procedure, the suggestion was offered that the state department of health be required to maintain a card index file of reported cases which could be consulted as occasion demanded. The details of the suggested alternate procedure could be worked out, it would seem, to accomplish the objective without requiring an unnecessary disclosure of confidential information.

The Bureau has collaborated with the Committee to Study Problems of Motor Vehicle accidents in this matter and will continue to do so.

There has been no recent enactment of state laws providing for the admissibility in evidence of chemical tests for intoxication in connection with motor vehicle accidents where it is suspected that the driver at fault was under the influence of alcohol. In 1947 legislation of this type was introduced in Delaware, Florida and Ohio but failed of enactment. A similar bill is now pending in Virginia. All these bills embody the essential provisions of the uniform draft formulated by the National Safety Council, with the aid of this Bureau, several years ago and approved by the House of Delegates. Twenty-three court decisions have come to the attention of the Bureau involving the admissibility in evidence of chemical texts for intoxication. These have been included in a mimeographed memorandum which is available on request. One-hundred copies of it were recently sent to the National Safety Council for use by its Committee on Tests for Intoxication, on which a staff member of Bureau holds membership.

Abstracts of Medicolegal Cases

The Bureau has during the period covered by this report continued to provide THE JOURNAL with abstracts of court decisions of medicolegal interest. In 1932 the House of Delegates authorized the republication of these abstracts periodically in book form. Three volumes have been made available under this resolution. The publication of a fourth volume was contemplated in 1946, but due to a combination of circumstances resulting from the war a delay was unavoidable. The preparation of a fourth volume is now well advanced, and as soon as an adequate index can be completed it will be offered to the members of the medical profession. It will include the abstracts published in THE JOURNAL during the calendar years 1941 to 1946, inclusive. While books of this type do not have an extensive demand, they are unique in their field and constitute, it is believed, a definite contribution to the advancement of knowledge of medical jurisprudence.

A Journal of Legal Medicine

There has been an increase of interest in the field of legal medicine since the war, both in the United States and elsewhere. The Bureau has received recently a request for information that might be of assistance in the organization of a medicolegal department in the Ministry of Justice in Teheran, Iran. A similar request came last year from India, where the establishment of a Forensic Science Laboratory for the Government of the United Provinces is contemplated. From the Medical Defence Union of London has been received a communication asking the collaboration of the Bureau in exploring the desirability of promoting the establishment of a section in the World Medical Association for the discussion of matters of medicolegal interest. These appeals, including one from the chief legal advisor, Public Health and Welfare Section, General Headquarters, Supreme Commander for the Allied Powers, Tokyo, Japan, for assistance in the formulation of an anatomic act for that country, point to an accelerated interest abroad in this particular field.

Here in the United States there was recently held in St. Louis an American Medicolegal Congress under the auspices of the Board of Police Commissioners. The congress was extremely well attended and a number of excellent papers were presented. Much interest was also manifested in the creation of a national organization and in the publication of a journal of legal medicine. The enthusiasm with which these proposals were received, although no final action was taken on them, justifies a belief that the time is opportune for the Bureau in cooperation with the Association's Committee to Survey the Relationship of Medicine and Law to renew consideration of the desirability of promoting a national organization for the discussion of matters having medicolegal aspects and of the publication of perhaps a quarterly journal of legal medicine. The Director of the Bureau and the Chairman of the Committee have on several occasions discussed both proposals but have considered that conditions resulting from the impact of war made it inadvisable to arrive at definite conclusions. More recently, in February 1948, another conference was arranged between the Director and the Chairman, as a result of which a small group interested in the subject have been asked to meet in Philadelphia March 11 further to consider these particular proposals and to explore other avenues that might lead to better application in the United States of medical and allied sciences to legal determinations.

Exhibit on Prevention of Malpractice Suits

The Scientific Exhibit at the Centennial Session of the Association at Atlantic City, N. J. last year afforded space to a number of exhibits descriptive of the work of the various councils and Bureaus at the headquarters office. The exhibit of the Bureau of Legal Medicine and Legislation pictorially suggested courses of conduct designed to prevent or diminish the growing incidence of malpractice suits. This exhibit was well received at Atlantic City and has since been used a number of times at state medical association meetings. It is nonscientific but educational in character and may be obtained from the Bureau of Exhibits on request for state meetings.

Medicolegal Aspects of Artificial Insemination

Artificial insemination is a procedure that is creating considerable interest on the part of physicians, if judgment can be based on the number of inquiries received by the Bureau concerning it. The primary interest as reflected by these inquiries has to do with the legitimacy of the issue when the donor is a person other than the husband of the woman inseminated.

The extent to which artificial insemination is employed in the United States evidences the importance of the questions that are being presented. In an article published in THE JOURNAL for June 21, 1941, the authors gave the geographic distribution of some 9,000 children that had at that time resulted from artificial insemination, in 3,649 of which cases a donor other than the husband was used. These figures were compiled from answers to a questionnaire returned by 7,642 physicians. The question of legitimacy arises because the child, while born in wedlock, is the offspring of the woman and a man who is not her husband. Unless the child is legitimate the husband and his wife must look forward to adoption procedures after its birth to establish its legal status and rights. This course, however, would tend, as one writer has stated, " to destroy the secrecy so desirable in a case of artificial insemination " since " court records are open to all curious eyes."

The medicolegal aspects of this subject are being considered not only in the United States but abroad as well. Several years ago the Medical Defense Union of London, England, at one of its meetings heard a thoughtful paper on this subject presented by its secretary, Robert Forbes, M.D., Ch.B.,J.P. More recently there appeared in the Paris letter in THE JOURNAL a statement to the effect that the problems of artificial insemination were being discussed in France by doctors, jurists, theologians and psychiatrists. In February of this year the Bureau received a letter from the Embassy of Sweden in Washington, D. C., indicating that the government of Sweden had recently appointed a committee to investigate the judicial and medical problems in connection with this procedure, with particular reference to the legal status of the child.

The questions that are being raised have not been adequately answered by any court. The Supreme Court of Ontario, Canada, in 1921 did undertake to discuss some of the aspects of artificial insemination but the discussion was by way of dictum not necessary for the decision reached in the case. A controversy arose in New York last year that afforded an opportunity for the court to remove some of the uncertainties of the legitimacy of the child born as a result of an artificial insemination. Briefly, a wife obtained a separation decree from her husband. The court in granting the decree permitted the husband the right to see at specified times a child born to the wife. The wife objected to the permission on the ground that the husband was not the father of the child, who was born following an artificial insemination. Unfortunately, the court in denying the wife's appeal for an amendment of the separation decree did not file a formal opinion. It did hold that the child had been "potentially or semi-adopted by the husband," that logically and realistically the situation was no different "than pertaining in the case of a child born out of wedlock who by law is made legitimate upon the marriage of the interested parties." The court expressed a disavowal of any intention of passing on "the legal consequences in so far as property rights are concerned in a case of this character."

It has been suggested that the enactment of legislation should be sought to legitimize the child resulting from an artificial insemination. Follow the controversy in New York, a bill was introduced in the Senate of that State providing as follows:

> *A child born to a married woman by means of artificial* insemination with the express or implied consent of her husband shall be deemed the legitimate, natural child of both the husband and his wife for all purposes, and such husband and wife and such child shall sustain toward each other the legal relation of parent and child and shall have all the rights and be subject to all the duties of that relationship including the rights of inheritance from each other. This acts shall take effect immediately.'

A similar bill pending in the Senate in Virginia contains the following phraseology:

> *Children Born as the Result of Artificial Insemination.*--Children born as the result of artificial insemination shall be considered the same as legitimate children for all purposes, if the husband of the mother consented to the operation.

The House of Delegates may well consider the advisability of endorsing in principle the enactment of legislation of this type.

The Bureau has carried on a considerable volume of correspondence with respect to artificial insemination dealing not only with the legitimacy problem but also with the responsibility assumed by a physician who selects or passes judgment on the fitness of a donor. There is under preparation at the present time a statement embodying available information on this subject, which will be produced either in mimeographed or printed form so that physicians may be more easily and promptly advised. Certainly, in artificial insemination the law must be applied to a novel situation and there are few court cases to serve as a guide.

Coroner-Medical Examiner Systems

Since the 1944 report of the Committee to Survey the Relationship of Medicine and Law concerning coroner-medical examiner systems was published, there has been a noticeable manifestation of interest in either the substitution of the medical examiner system for the coroner system or the modernization of the latter system to make it more effective.

The development that took place in Virginia in 1946 deserves particular comment because it may well set a pattern for other jurisdictions where for constitutional, political or other reasons the office of coroner cannot readily be abolished. The 1946 Virginia law had its legislative beginning in a Senate Joint Resolution passed by the General Assembly of that state in 1942, directing the Virginia Advisory Legislative Council to make a study and report on the advisability of abolishing the office of coroner and transferring the duties of the office to medical examiners and law enforcement officers. The Legislative Council, through a committee appointed by it, promptly initiated the study contemplated by the Joint Resolution. It contacted the Director of the Bureau of Legal Medicine and Legislation early in 1943 and was supplied with available basic data on the subject. The Committee to Survey the Relationship of Medicine and Law, through its chairman, Dr. Alan Moritz, gave continuous advice in the formulation of the draft of a bill that eventually was enacted into law. The Medical Society of Virginia collaborated closely in this study and in the formulation of legislation. In 1944 the Legislative Council submitted a report to the Governor and the General Assembly of Virginia as contemplated by the Joint Resolution. This report, however, did not recommend the abolition of the office of coroner, as had been recommended by the Committee created by the Legislative Council, because of a belief on the part of the Council that the recommendations of the Committee would entail too much expense. The Council did suggest certain changes in the existing law, referred to in the report as "minor changes." Following the submission of this report, however, efforts were renewed on the part of representatives of the medical society of the state to develop legislation that would put into effect in Virginia an effective and modernized system for determining the cause of death in cases where crime is known or suspected to have occurred. These efforts bore fruit with the enactment of Chapter 355, Acts of Assembly, 1946. This law created a Commission on Postmortem Examinations, composed of the attorney general, the state health commissioner, the superintendent of state police, the dean of the Medical College of Virginia and the dean of the Medical School of the University of Virginia, all ex officio. This Commission is authorized to appoint a chief medical examiner for the state and to establish and maintain in Richmond, under the supervision of the chief medical examiner, a central office and a laboratory having adequate professional and technical personnel and physical facilities for the conduct of postmortem examinations and of such pathologic, bacteriologic and toxicologic investigations as may be necessary or proper.

The Commission is authorized, if it deem advisable, to enter into a contract with the Medical College of Virginia for the use of certain of its laboratories, its morgue and other technical facilities, and for space in one of its buildings as a central office for the chief medical examiner and his staff. In the discretion of the Commission, the chief medical examiner and his assistant may be made available to the Medical College of Virginia and the Medical School of the University of Virginia for teaching legal medicine and other related subjects. The Commission is authorized to appoint one or more coroners for each county and city in the state. Each coroner is to be appointed from a list of two or more licensed doctors of medicine submitted by the component medical society of the county or city in which the appointment is to be made, or of the district in which the county or city is located. Whenever the death of any person occurs from violence, or suddenly when in apparent health, or when unattended by physician, or in prison or in any suspicious, unusual or unnatural manner the coroner is to be notified by the physician in attendance, by any law enforcement officer having knowledge of such death, by the undertaker or by any other person present. On receipt of such notice, the coroner will take charge of the dead body, make inquiries regarding the cause and manner of death, reduce his observations to writing and promptly make a full report to the chief medical examiner. A copy of the report is to be sent to the appropriate Commonwealth's Attorney.

If in the opinion of the coroner or of the chief medical examiner it is advisable in the public interest that an autopsy be made or if an autopsy is requested by the Commonwealth's Attorney or by the judge of the circuit or corporation court of the city or county where the body is found, such autopsy will be made by the chief medical examiner or by such competent pathologist or toxicologist as may be designated by him for the purpose. It is declared to be unlawful to embalm a dead human body when any facts within the knowledge or brought to the attention of the embalmer are sufficient to arouse suspicion of crime in connection with the cause of death until the permission of the coroner is received. It is likewise declared unlawful to cremate the body of a deceased person until the coroner shall have certified in writing that he has viewed the body and made personal inquiry into the cause and manner of death and is of the opinion that no further examination or judicial inquiry concerning the same is necessary.

The foregoing represent some of the important provisions of the new Virginia Law. Its operation will be watched with considerable interest. Reorganization legislation introduced in the Virginia General Assembly in 1948, and which apparently will be enacted, will abolish the Commission and transfer its functions to the State Department of Health.

In 1947 the medical examiner laws of three states, Maine, New Hampshire and New Jersey, were amended in an effort to make them more effective. The Texas coroner law was substantially changed to improve it, and similar laws were variously amended in seven other states, Alabama, Arkansas, California, Delaware, Georgia, North Carolina and Pennsylvania.

Protection of Medical Research

In 1947 bills were introduced in a number of state legislatures and in Congress designed to impede or prohibit the use of animals in connection with medical research. Bills of this type made their appearance in California, Illinois, Massachusetts, Michigan, Nevada, Pennsylvania and Wisconsin. While some of these bills reached the hearing stage, none was enacted.

In Michigan in 1947 a law was enacted specifically recognizing the need for the utilization of animals in medical research and authorizing the state commissioner of health, aided by an advisory committee, "to regulate and to promulgate rules and regulations controlling the humane use of animals for the diagnosis and treatment of human and animal diseases, the advancement of veterinary, dental, medical and biological sciences, and the testing and diagnosis, improvement and standardization of laboratory specimens, biologic products, pharmaceuticals and drugs."

In New York in 1947 an amendment to the penal code was enacted which specifically authorized the state commissioner of health to approve laboratories and institutions in which scientific tests, experiments or investigations involving the use of living animals may be performed or conducted. The prior law authorized such experimentation only under authority of the faculty of some regularly incorporated college or university of the state, but the commissioner of health had no jurisdiction in the matter.

A number of years ago a staff member of the Bureau developed a draft of a uniform state law affirmatively to authorize the state department of health to approve institutions in which dogs could be used to promote research and providing for the transfer to such institutions of unclaimed impounded dogs. This draft was prepared at the request of the Secretary of the Committee on the Defense of Biological Research of the Federation of American Societies for Experimental Biology. More recently, the enactment of legislation of this type has been sponsored by the National Society for Medical Research.

There was introduced in Pennsylvania in 1947 a bill following substantially the draft prepared by the Bureau. It was not enacted. In 1948 the draft with some modifications was introduced in Massachusetts but favorable action has not as yet been taken on it.

State Legislation in General

The Bureau has continued its study of state legislation of medical interest. Through a legislative reporting service, it promptly receives copies of all such legislation. Brief comments are prepared on the more important bills for publication in THE JOURNAL. Each year a detailed summary is prepared of the important enactments, and this summary is also published in THE JOURNAL. The summary for 1947 was republished in the Bulletin of the Federation of State Medical Boards.

State medical associations are kept currently advised of proposals submitted to the legislatures of their states, and the services of staff members of the Bureau are available, on request, for aid in appraising particular bills. The staff personnel is also being utilized more and more by state medical associations in the development of adequate measures for the protection of health, covering a wide variety of subjects. The Bureau always welcomes the opportunity to be of help and wishes through the medium of this report to express its appreciation for the cooperation it has received from such associations.

Bureau of Exhibits

The Bureau of Exhibits administers the Scientific Exhibit at the Annual Session and Interim Session under the Committee on Scientific Exhibit of the Board of Trustees, presents medical exhibits at meetings of state medical associations and other scientific organizations, maintains health exhibits for fairs and expositions and cooperates with numerous organizations in the dissemination of information concerning graduate medical instruction and health education. Through the Committee on Medical Motion Pictures, leadership is being assumed in the use of motion pictures for teaching purposes.

The Bureau works in close cooperation with the other councils and Bureaus of the Association, preparing and maintaining exhibits for them.

The Scientific Exhibit—Centennial Session

The Scientific Exhibit at the Centennial Session in Atlantic City, N. J., was an outstanding testimony to the popularity of this form of graduate medical instruction. The huge crowds which thronged the aisles during the week extended to the utmost the facilities of the management and the endurance of the demonstrators. Nearly a thousand demonstrators participated in the Scientific Exhibit, and they deserve much credit for their patience and perseverance. Those persons who carried on during the entire week without a substitute to relieve them deserve special mention for their energy.

The significance of the occasion resulted in a large amount of historical material. A group of sixteen exhibits prepared by the Bureau of Exhibits depicted the activities of the Association over a hundred years and showed the work of all the Councils and Bureaus of the Association. Numerous other exhibits dealt with the history of many of the medical specialties.

The Special Exhibit on Fractures was as popular as ever, even though it has been shown at almost every Annual Session over a period of twenty years under the guidance of Dr. Kellogg Speed, Chicago.

The Special Exhibit on Physical Medicine, shown for the second time under a committee of which Dr. Frank H. Krusen, Rochester, Minn., was chairman, included physical therapy, occupational therapy and rehabilitation. Many of the demonstrations included the participation of amputees, hemiplegic persons and those with other disabilities. A platform was constructed in front of this group of exhibits to accommodate the crowds.

The Special Exhibit on Cardiovascular Diseases, organized by Dr. Paul Dudley White, Boston, contained the most inclusive group of exhibits ever presented on this subject. There were seventeen booths covering all phases, with demonstrators in constant attendance. In an adjoining area a question and answer conference on cardiovascular diseases was conducted by Dr. Edgar V. Allen, Rochester, Minn., with the cooperation of the American Heart Association.

The Special Exhibit on Fresh Pathology was presented by a group of competent pathologists, of which Dr. Frank W. Konzelmann, Atlantic City, N. J., was chairman. Specimens were brought in daily by messenger from Philadelphia, supplemented by material from the Atlantic City Hospital.

A group of exhibits on diabetes was arranged by Dr. Howard F. Root, Boston, the highlight of which was a question and answer conference in which outstanding authorities on diabetes participated. The audience filled this room to overflowing constantly throughout the week.

The seventeen sections of the Scientific Assembly each presented groups of exhibits dealing with the various specialties in medicine. These exhibits were selected, however, for their interest to the physician in general practice rather than the specialist. There were three hundred and forty-one applications for space, of which two hundred and twenty-seven were accepted—66 per cent. The largest group was that of the Section on Surgery, General and Abdominal, with twenty-six exhibits; the smallest, the Section on Anesthesiology with six exhibits. A representative to the Scientific Exhibit was appointed by each Section to assist and advise the Committee on Scientific Exhibit in the procurement and selection of material. The representatives gave freely of their time and energy in securing exhibits of exceptionally high caliber.

A miscellaneous group of exhibits included large displays from the United States Army, Navy and Veterans Administration, which were especially attractive.

There were twenty-nine awards, including six medals, eight certificates of merit, eight honorable mentions, six special commendations and one certificate of appreciation. The Committee on Awards, consisting of Dr. Max M. Peet, Ann Arbor, Mich., chairman; Dr. Arthur W. Allen, Boston; Dr. Francis G. Blake, New Haven, Conn.; Dr. William P. Herbst, Washington, D. C.; and Dr. Walter M. Simpson, Dayton, Ohio, performed a herculean task and submitted a report which received unanimous approval.

Motion pictures were shown in three theaters adjoining the exhibits. Ninety-five films were offered, of which sixty were selected after preview by competent authorities. Several of the films were shown in conjunction with exhibits on the same subject.

The Scientific Exhibit—Interim Session

The Scientific Exhibit for the Interim Session held in Cleveland in January 1948, was organized during the autumn months. A relatively short time was available for the task, which was performed in addition to the normal activities in connection with the Annual Session to be held the following June.

There were four groups of special demonstrations. These included the Cancer Detection Center, with an appointment center, an information center and a large group of exhibits presented by the American Cancer Society in connection; clinical demonstrations, conferences and exhibits on dermatology; a series of talks and conferences on diabetes as encountered in the general practice of medicine, illustrated by lantern slides and by patients and accompanied by a group of exhibits with laboratory demonstrations on the determination of blood sugar as a special feature and demonstrations on the conservation of hearing.

Provisions were made for sixty exhibits in addition to those accompanying special demonstrations. Thirty of these were new and thirty repeated from the Scientific Exhibit at previous sessions. All exhibits were selected for their interest to the physician in general practice. The different sections of the Scientific Assembly did not participate, nor were arrangements made for awards. There were a considerable number of exhibits on industrial health in connection with the Congress on Industrial Health. Exhibits on physical medicine and rehabilitation covered many phases of that subject, with demonstrations by physically disabled persons. Other groups of interest included automobile accidents and resuscitation, nutrition, child health, treatment of burns and endocrine preparations. Motion pictures were shown in an area adjoining the exhibits, fourteen films being presented once each day.

Association Exhibits

The Association Exhibits depict the work of the various Councils and Bureaus at Association headquarters. During the year ten new subjects were added to the list and some of the old exhibits brought up to date. Other exhibits were discarded as no longer serviceable. The total available for loan purposes numbered forty-six at the end of the year.

Medical Exhibits—Fifty-seven medical exhibits were shown at thirty-two meetings of state medical associations and other scientific organizations, including dental, pharmacal and similar groups. A member of the headquarters staff was present at each meeting to install and demonstrate the exhibit, the Director of the Bureau of Exhibits attending many of the meetings personally.

Health Exhibits—The Association has prepared exhibits which are available on a loan basis for the public at fairs and expositions. Requests from groups other than medical societies are referred to the local state or county medical society for approval. Responsibility for installation and demonstration is borne by the organization which borrows the material. Seventy health exhibits were sent to twenty-six fairs and other gatherings of the public, including museums, during the year. Many of these exhibits were on display for several weeks or months, reaching hundreds of thousands of persons.

Numerous requests which are received for exhibits on certain specialized subjects cannot be complied with, or are referred to other agencies. There is also an incessant call from schools, women's clubs, nurses and health departments for small exhibits that are easy to handle and require a minimum of space to install. Such requests must of necessity be referred back to the state organizations, since the Bureau of Exhibits does not have the personnel or the funds to cover the many thousands of schools and small organizations in the country.

Museums

Museums, with their readymade audiences, offer opportunities for health education which should not be overlooked.

The Museum of Science and Industry in Chicago, with an annual attendance of 1,500,000 persons, has had on display a large amount of material from the American Medical Association for several years. Much of this has become antiquated and should be replaced at an early date. The Director of the Bureau of Exhibits, with the approval of the Board of Trustees, has assumed the duty of Executive Director of Medical Exhibits at the Museum.

The Cleveland Health Museum, devoted entirely to health purposes, has used much material from the American Medical Association, some on permanent display and some temporary. The Director of the Bureau of Exhibits is on the Advisory Committee of the Museum.

The Dallas Health Museum, which was organized recently, has called on the American Medical Association for a large number of exhibits. The Toledo Museum of Science makes a special feature of its health exhibits during the summer months, at which time exhibit material is sent from Chicago.

The question and answer service has been maintained at Cleveland and Dallas with the cooperation of the Bureau of Health Education. This service was discontinued at the Chicago Museum of Science and Industry, because the large number of questions received placed too great a burden on that Bureau.

Committee on Medical Motion Pictures

The Committee on Medical Motion Pictures is a subcommittee of the Bureau of Exhibits. The Committee is in constant touch with numerous other agencies interested in motion pictures in the United States, as well as in Canada, Mexico, Brazil, Great Britain, Australia, India and China.

Film Library—The film library was increased by nine titles during the year, making a total of fifty-two titles, of which there are one hundred and ninety-one prints. New copies were purchased to replace those which were worn out. Thirteen hundred and thirty-seven films were lent to hospitals, medical schools, medical societies and physicians. Civilian hospitals were the most frequent borrowers, with the Veterans Administration, the Army and the Navy using the pictures many times. Priority is given to requests from county medical societies, and these are increasing in number. Films were sent to forty-two states, the District of Columbia, Alaska and Mexico. While it is not the policy of the Association to produce motion pictures, one picture was made for use at the Centennial Session, entitled "The Medical Motion Picture—Its Development and Present Application." It has been well received both in this country and abroad. At the request of the British Medical Association and with the approval of the Board of Trustees, a copy was donated to it.

Film Reviews—Medical motion pictures made by physicians, pharmaceutical houses and institutions are submitted to the Committee on Medical Motion Pictures for review. Fifty-two reviews have been published in THE JOURNAL. These reviews are widely read and well received and constitute the most valuable contribution which has been made to the field of motion pictures. They will be published in booklet form, with supplemental issues from time to time.

Source File—A source file of all the medical motion pictures which are available for purchase, rental or loan, is in the course of preparation. The task is a gigantic one, and its completion will require considerable time. Numerous requests are received for information about films on specified subjects, and such a source file, kept up to date, is necessary.

Motion Picture Facilities—A survey of facilities to show motion pictures in medical schools and by medical societies indicated that such equipment is inadequate. Most medical schools use films to some degree in teaching, but few of them are properly equipped with sound and silent projectors. Thirty-two state medical associations use medical motion pictures in their meetings, while ten have no access to equipment. Information was not received from the remaining state associations.

Among eight hundred and five county societies, thirty own sound projectors, three hundred and twenty-nine others have them available and one hundred and thirty-three have no access to them.

The chief sources of medical motion pictures for both medical schools and medical societies are commercial and pharmaceutical houses.

Miscellaneous Activities

Members of the Bureau staff have been engaged in numerous conferences on matters pertaining to visual education with persons from the United States and foreign countries and have addressed meetings on many occasions. Members of the staff have also served on committees with various national and international groups.

Publications sponsored by the Bureau have continued to be popular. The second edition of "Fundamentals of Anesthesia" has been entirely exhausted, and the fifth edition of the "Primer on Fractures" nearly so. Pamphlets on "Medical Exhibits" and "Health Exhibits" have had a wide distribution. Mimeographed copies of articles on various subjects pertaining to exhibits and to motion pictures have been in constant demand.

Bureau of Medical Economic Research

The Bureau of Medical Economic Research was reorganized late in 1946, so that this is the first opportunity to prepare the annual report on a calendar year basis.

Publications

There are in the Bureau's files forty-eight publications which were produced between 1931 and 1946, when this department was called the Bureau of Medical Economics. Since the reorganization, the Bureau of Medical Economic Research has published twelve articles, copies of which are available to those who wish to order them. The following paragraphs describing some of these publications will provide a picture of some of the work that is being done by the Bureau:

Dividends from the Quest for Health, a brief analysis of the monetary value of longer life, appeared in *Hygeia* in January, 1947.

Fundamental Requirements of Insurance Applied to Voluntary Prepayment Medical Care Plans tests the voluntary prepayment plans against the fundamental requirements of insurance which have evolved during several centuries of insurance experience. A given economic risk is not insurable merely because it is important. The plans generally measure up to these time tested requirements of insurance. Reprints of the article and of an editorial which accompanied its appearance in THE JOURNAL have been requested by many managers of prepayment plans.

Medical Service Areas in the United States briefly reviews prevailing methods of marking off marketing areas without regard to county or congressional district boundary lines and states the reasons why the physician-population ratio per county is insignificant. This article proposes as a substitute a physician-population ratio per medical service area; such an area would circumscribe the communities where the patients live who are served by the physicians in the principal towns and cities of that area; it would be an economic, not a political area. In this connection the Bureau is making a study of medical service areas in the United States using well established technics of marketing research. The cooperation of the secretaries and executive secretaries of the state medical associations in this study has been very heartening. At the present writing it appears that there will be about a thousand medical service areas in the United States. Every person and every square mile of the United States will be located in a medical service area. The physician-population ratio of each area will be considerably more significant, though not ideal, than the traditional physician-population ratio for each county. It is hoped that the work will be so well done that statements citing the number of counties in the United States that do not have a physician will disappear from the literature of medical economics.

Medical Groups in the United States: In this publication the number of physicians who are members of groups is expressed as a percentage of the number of physicians in active practice. The percentage of physicians engaged in group practice indicates that group practice is relatively most prominent in Minnesota, California, Montana and the West North Central, Pacific and West South Central states and the least prominent in New York, New Jersey, Pennsylvania and the New England and Middle Atlantic states.

The Trend Toward Labor Health and Welfare Programs presents a brief review of the conditions, most of which grew out of World War II controls, responsible for the demand on the part of labor unions that provision for the health of union members be made by some kind of group insurance plan. Many of these plans are provided in the union contracts negotiated with the employers.

Analysis of Questionnaire on Medical Care of Civilians During World War II. Late in 1946 the Bureau was assigned the task of assisting the then Committee on National Emergency Medical Service. About one-fifth of the time and funds of the Bureau during 1947 were devoted to an analysis of certain aspects of medical service during the war. This analysis and an editorial concerning it appeared in THE JOURNAL for March 24, 1947. Although the questionnaire was sent to less than 5 percent of the physicians who remained in civilian practice during the war, the returned questionnaires provided an excellent sample from a statistical point of view. The replies revealed that the patient load increased seventy-five percent between 1941 and 1944, that civilian physicians were rather favorably impressed with the work of the Procurement and Assignment Service, that more physicians could not have been spared from their communities for military service, especially from the smaller communities, and that an overwhelming majority favored the creation of a board to represent the medical profession with power to set policy for the utilization of all physicians in the event of another national emergency. A curious, unexpected and fortuitous result of having only 60 per cent of the physicians at home to care for the 91 per cent of the population which remained civilian was that the crude death rate of the American people in 1942 was at an all-time low. This "riddle of supply" is an effective answer to those who charge that there is an extremely grave shortage of physicians in the United States in 1948.

Analysis of Replies to Postwar Questionnaire. From the standpoint *of effort alone, this was the outstanding publication* of the Bureau during 1947. The Bureau analyzed the 26,000 replies to the postwar questionnaire, which had been sent to 50,000 discharged medical officers. The information obtained was very difficult to code but yielded extremely significant results. This study presents an insight into certain phases of the military medical history of World War II; and its *scope is so great that an adequate* summary can not be presented at this time. The continuing demand for copies of this publication has exceeded expectations.

Is Medical Care Expensive? The Bureau published this pamphlet in September. The expenditures of the American people for medical care for the period 1929 to 1945 were published by the United States Department of Commerce in July. Using this data the expenditure for medical care was compared with a number of other items of consumer expenditures. One important conclusion was that although medical care expenditures in dollars have risen rapidly in recent years, they actually constitute a decreasing percentage of the income as well as of the total consumer expenditures of the American people. In the seventeen years covered by these data medical care expenditures, expressed as percentages of these two national aggregates, reached their peaks during the depression years of 1932 and 1933. A great many leaders in medicine and hospital administration were laboring under the illusion that medical care costs had risen out of all proportion to the ability of the people to pay. The Director had the pleasing experience of destroying this illusion by helping these leaders to see the position of medical care expenditures in the general economic picture of the times. Lantern slides of the six charts in the bulletin have been furnished to more than half of the state medical association secretaries for use in their public relations programs. This bulletin also pointed out that the physician's share of the medical care dollar has declined from 32 cents in 1929 to 27 cents in 1945. The record of increasing life expectancy in the United States since 1929 indicates clearly that the people are getting more for their money now.

Four Punch Cards for Every Physician

As soon as the Bureau of Medical Economics Research began operations under the present Director, the International Business Machines at Association headquarters were put in its charge. The inventory of old punch cards was found to be defective and incomplete, and the Bureau was instructed to prepare a new and expanded set of punch cards on all living Doctors of Medicine in the United States, Canada, Alaska, Hawaii and Puerto Rico.

A unique serial number has been assigned to every living physician. Thirty blank numbers were provided between successive names to provide for new names. These serial numbers should be adequate for at least two decades. The serial numbers have been assigned in alphabetic order and permit the utilization of the maximum speed in operating the I.B.M. equipment. Forty of the eighty columns in the punch card are used to record certain factual information regarding the physician. The same information is punched into three cards. The other forty columns of the first card contain the doctor's first name, middle initial and last name with M.D. following the name. The first forty columns of the second and third cards contain his street address, if any, and town, postal zone and state. When the operation is completed, a fourth punch card will provide many important types of statistical information, will be added to the inventory and will become the basic tool of the Bureau for studying many problems of medical economics. When the inventory is completed, the American Medical Association will be able to furnish the Secretary of Defense in Washington within a matter of hours a complete list of all the living physicians in the United States together with information about each one of them which is punched into the cards. At the present writing there is some indication that the serial number used in this large operation may be utilized by other private and official agencies in close contact with the medical profession. The completion of this four punch card inventory will continue to constitute a considerable portion of the work of the Bureau through 1948 and well into 1949. The study of medical service areas cannot be completed until this punch card inventory is available.

Bureau Work for Others

Aside from the work of the Bureau for the Council on National Emergency Medical Service, the services of the Bureau have been made available to the other Bureaus, Councils and departments of the Association. During 1947 the statistical staff performed punch card and machine operations incident to the annual hospital survey for the Council on Medical Education and Hospitals, and plans are under way to perform the same operations for the Council incident to the State Board number of THE JOURNAL. Assistance has been given to surveys being made on medical motion pictures and on salaries of physicians in industrial practice. A long study has been undertaken for Associated Medical Care Plans in which the first step is to prepare a columnar analysis of the more than 1,500 different phrases or provisions in the more than fifty-eight contracts issued by member plans to their subscribers.

The Bureau has exchanged punch cards with the Surgeons General of the Army and Navy. The ease of duplicating punch cards will clearly increase the usefulness of the punch card inventory and will require a reexamination of the relationship of the Bureau with inside and outside agencies.

The Bureau's study of group practice, designed as a continuation of the two earlier periodic surveys made by Dr. R. G. Leland, former Director, has been broadened pursuant to the adoption of the resolution on group practice by the House of Delegates at the Atlantic City Session in June 1947.

The Bureau has received a duplicate set of punch cards developed by the U. S. Public Health Service for its excellent study on group practice. That study, starting in 1945 and already reported in three published articles, has made it necessary to reexamine the plans for the Bureau's study in order not to duplicate unnecessarily the scope and coverage of their study.

The practice of sending each new pamphlet as it is printed to a number of persons in the health education field, discontinued during hostilities, was resumed in February.

This year the Bureau produced the Association's annual catalog of publications for public instruction and also a supplemental catalog of available mimeographed publications, hitherto unpublicized.

Cooperative Relationships

Joint Committee on Health Problems in Education of the National Education Association and the American Medical Association—The 1947 meeting of the Joint Committee was held, for the fourth consecutive year, at American Medical Association headquarters, May 12 to 15, 1947. Principal items dealt with by the Committee were as follows: Appointment of a subcommittee to explore possibilities for improving the work of and procuring financial support for the National Conference for Cooperation in Health Education; a report on an "Individual Height-Weight Record" and suggestions for its use by teachers and a report on a "Physical Growth Record"; a report on "A Nutritional Program for Schools"; the "Report of the Subcommittee on Standards for Determining the Health Status of School Children", and revision of the Committee's 1937 resolution on eye examinations of school children.

The term of Dr. W. W. Bauer, Director of the Bureau of Health Education, as a member of the Joint Committee expired in 1947, and the Board of Trustees of the American Medical Association appointed Dr. Dean F. Smiley, Consultant in the Bureau's Division of Health and Physical Fitness, to succeed him.

National Conference on Cooperation in Health Education—A meeting was held in Washington, D. C., April 10 to 11, 1947, at which it was reported that 42,000 copies of the report on the "Functions and Education of the School Administrator, the Physician and Nurse in the School Health Program" had been distributed. Six educational groups will be included in the initial planning for a new project of the National Conference, i.e., a statement of the "Functions and Education of the Classroom Teacher in the School Health Program." The preparation and publication of a pamphlet "The Nurse in the School" has been accepted as a project of the Conference, financing to be taken care of by the National Organization for Public Health Nursing. A minimum membership fee of $50 was decided on, and agencies who are able to make larger contributions are encouraged to do so.

American Public Health Association—Committee on Professional Education: This is one of the most important committees on which the Director of the Bureau is a member, since it is working toward objectives fully endorsed by the medical profession, namely, improvement of the public health by improving the qualifications and training of public health personnel. The committee meets about twice a year, including one meeting at the time of the annual convention of the American Public Health Association. This Committee has prepared reports on the qualifications of health officers, bureau chiefs, sanitarians and health educators and is working on other reports. It supervises the accreditation of schools of public health for giving the master's and doctor's degree in public health and directs the activities of the American Public Health Association's Merit System Unit and Placement Bureau. The Director has served two terms, the last of which will expire early in 1948. Association policy precludes reappointment after two successive terms.

Committee in Accident Prevention—This subcommittee is allocated to the Committee on Administrative Practice and has furthered accident studies and considered the publication of material in the field of accident prevention.

Committee (Illinois) for Estimate of Needed Health Educators—The Associate Director of the Bureau serves on this subcommittee of the Committee on Planning for Health Education.

American Cancer Society Educational Committee—This committee meets every month, usually in New York and usually starts its meeting at 4:30 p.m. and continues it into the evening. For this reason it becomes necessary to spend two full days in New York at times when the use of planes is impossible. The Director has therefore been unable to attend many of these meetings. This committee is concerned primarily with professional education and has shown little interest in lay health education except for money raising campaigns for the American Cancer Society.

The Director of the Bureau also serves on the following committees: Executive Committee of the National Society for Medical Research; Advisory Board on Health Services, American Red Cross; National Committee for Traffic Safety; American Medical Association Committee to Confer with National Safety Council, and The President's Highway Safety Conference, Committee on Organized Public Support. The Bureau continues to cooperate, largely by correspondence, with a large number of government agencies.

Appreciation

The Director of the Bureau of Health Education wishes to express his appreciation to the Trustees and to the Secretary and General Manager for the opportunities for increased service made possible in numerous ways during 1947

As usual, the Bureau has also enjoyed the cooperation of physicians outside Association headquarters. Special thanks are due those who cooperated in radio, television and transcription programs and who have furnished answers to questions and have helped us with advice and consultation. The Bureau appreciates the cooperation of other departments in the Association.

Bureau of Industrial and Personnel Relations

During 1947, the first year of operation of the Bureau of Industrial and Personnel Relations, study was made of the personnel administration needs of the Association. In the light of that study, of activities carried on in the past by the Association and of expanding experience, a plan of personnel administration was developed. This program obviously will be subject to future evolution and development as future appraisals and experience indicate. Appended to this report is a functional analysis of the Association's present personnel program. This program, with certain exceptions, is, or is proposed to be, under the direction of the Bureau of Industrial and Personnel Relations.

The personnel program is divided into four main divisions, with respect to both the office and the mechanical departments. These divisions are (1) employment; (2) wage and salary determination, sometimes referred to as wage and salary administration; (3) research and planning, and (4) employee relations. The first main division has, with respect to the office, five principal subdivisions, as noted in the appended analysis. The procurement of office personnel, the screening of applicants for ultimate selection by a department head and the handling of exit interviews are activities not presently being carried on by the Bureau. Employee relations, the fourth main division, has a subdivision referring to certain employee services, namely, the administration of the program of the Association for its employees with respect to life insurance annuities and hospital and medical care. The employee services just noted are administered by the Comptroller of the Association entirely independent and apart from the Bureau.

Functional Analysis of Personnel Program

Employment	Wage and Salary Determination	Research and Planning	Employee Relations
		Office	
Procurement (*a*) Advertising* (*b*) School contacts	Description of job duties Evaluation and grading of jobs	Organization analysis (*a*) Levels of authority (*b*) Work flow (*c*) Promotional opportunity	Counseling with individual employees having grievances or personal problems affecting work performance
Selection (*a*) Interviews* (*b*) Tests (*c*) Medical exams	Pricing of job grades based on wage surveys in the area	Analysis of manpower needs and utilization	Attitude or morale surveys reflecting sore spots and how they can be corrected
Placement Exit interviews*	Salary adjustments Performance rating	Ways and means of measuring the effectiveness of personnel technics with view of improving same	Supervisory training to improve the handling of personnel
Unemployment compensation claims, hearings, etc.	Writing of job specifications to be used in employment Analysis and control of overtime costs	Analysis of federal and state laws and regulations as they affect employer-employee relations	Employee services (*a*) Insurance - hospital medical care and life+ (*b*) Annuity plan +
		Mechanical Department	
Most phases of employment such as procurement, selection, placement, etc. are controlled by contractual relationships Unemployment compensation claims, hearings, etc Administration of G.I. training program	Wages established through contract negotiations Analysis and control of overtime costs Development of wage formula to expedite negotiations	Analysis of federal and state labor laws as they affect management-union relations Compilation of statistics supporting negotiations strategy Constant need for studying improved printing technics to reduce labor costs	Presenting management's position in all grievances to the union and following through the appelate procedure as established in union contracts Regular participation in industrywide bargaining with the several unions to formulate acceptable contracts Letters and other means of contacting directly individual employees to give them both sides of issue Employee services (*a*) Insurance - hospital medical care and life+ (*b*) Annuity plan+

* Mr. Bruce.
+ Mr. Hoffman.

The largest specific job carried on in 1947 by the Bureau was the determination of wage and salary policy for office personnel. As a preface to a discussion of that project, it should be stated that for the purpose of salary and wage administration there are four classes of employees at Association headquarters;

1. Employees under union contracts. The Bureau of Industrial and Personnel Relations either deals directly with the union concerned or through collaboration with the job or commercial printing industry trade association, the Franklin Association, of which the Director of the Bureau is a member of the Board of Governors; he is also a member of some negotiating committees that affect the American Medical Association.
2. Office employees receiving less than $5,000 per year compensation.
3. Administrative, executive and professional employees not of top status.
4. Top executives.

The aforementioned project relates only to class 2 as just defined.

With respect to class 1, employees under union contracts, the Bureau already has devoted time and effort, through endeavors in the plant and through industrywide cooperation, to the negotiation and settlement of wage scales. As to class 3, administrative, executive and professional employees not of top status, the Bureau will undertake future studies when adequate experience with respect to class 2 has indicated a course of intelligent, reasoned and proved conduct. The future course with regard to class 4 depends on a rational, functional survey of departmental values, which it is hoped will be conducted some time in the future.

During 1947, as already stated, the Bureau conducted a study to determine a fair distribution of the payroll to "ordinary" office personnel in accordance with performance values. It was necessary to determine the relative value of what each office employee does in the line of his or her official duties. After consultation with heads of departments and in many cases with individual employees affected, some seventy job classifications were established. These job classifications are too lengthy for inclusion in this report but are available for inspection and study. After consideration of what employees actually do on the basis of these descriptions, a job evaluation was then determined and point values established on the basis of the requirements of each job. The system utilized in the job evaluation study is too lengthy for inclusion in this report but also is available for inspection and study. The theory adopted in the job evaluation study is, it is believed, in accordance with sound personnel practice and the later developments in the field. The class of employee subject to the study is divided into so-called salary grades, according to the point values of duties involved. Each salary grade has a minimum and a maximum salary. The endeavor is to see that the average of the employees in each classification approximates the normal of his or her classification. This normal, in turn, either is the midpoint of the salary range or is the median salary paid in the area for the functions concerned. Individual employees may be above or below that normal, in accordance with their abilities, their performance and their experience. It is proposed at periodic intervals to review the performance of each employee by a system of performance rating and to recommend to the General Manager equitable salary adjustments in accordance with those studies.

Much time has been spent by the Bureau, particularly since 1947, in the negotiation of union contracts. As of the date of this writing, March 27, 1948, this effort has not been wholly successful with respect to one typographical union which, as a matter of national strategy, has adopted a policy of no contractual relations and has attempted to impose on the printing industry unilateral conditions of employment imposed solely by the union without proper negotiation with employer groups. This has resulted in a temporary cessation of activities in the Association's composing room, but the publication of THE JOURNAL has continued, its composition being effected by the use of Vari-Typer machines and an out of state print shop. The Bureau has played an active part in the establishment and operation of the Vari-Typer Department. It is hoped that normal composing room operations will have been resumed by the time this report is read.

Committee on Rural Medical Service

The committee on Rural Medical Service has been in existence three years. During this period certain things have been accomplished:

1. In each state a Committee on Rural Medical Service has been created by the state medical association so that the rural problems peculiar to each state can be studied by those familiar with local needs. These state committees are expected to contact the farm leaders whose cooperation is needed if community action is to be obtained.
2. Three annual conferences on rural health have been held in cooperation with the four largest farm organizations. The first explored the nationwide need for better medical care. The second dealt with ways and means by which better health levels could be achieved, and the third had to do with the specific problem of rural youth and the need for better health guidance for the growing farm child.
3. In 1947, to assure a more realistic program for the future, the four largest farm organizations were invited to appoint advisory members to meet with the Committee. The American Farm Bureau Federation, the Farmers Union, the National Grange and the National Cooperative Milk Producers Federation each appointed two of their members, all of whom have been most helpful.

As a result of the second annual conference, the need of trial and error experience on the community level was deemed imperative. The Committee adopted as its objective the organization of communities on the county and trade area basis for the purpose of improving health, cultural and economic conditions. These organizations were to be called Health Councils, or Community Health Improvement Associations. During 1947 such organizations were formed in a number of states, and the number is constantly growing. Health Councils should not be formed for narrow or limited objectives, since the factors that affect health are as broad as human experience.

Many groups having limited objectives are now active in the health field. In this regard may be mentioned the National Tuberculosis Association, the National Foundation for Infantile Paralysis, the American Cancer Society, the American Heart Association and a number of federal government departments. None of these alone can do a complete job; all of them combined leave too much undone.

A properly conceived health council, composed of community leaders with an adequate action and educational program under the direction of capable medical guidance, can do a complete job. This is what the Committee on Rural Medical Service has in mind. At present, we have the state medical association committees on rural health; the farm organizations have comparable committees in many states; the extension departments of the agricultural colleges are ready to cooperate along with their own health education programs; the national 4 H farm youth groups are interested in a health program and will be welcome allies; the Cooperative Health Federation of America, the medical cooperative organization, is willing to cooperate on a basis of minimum professional standards deemed necessary for the provision of good medical care.

An intelligent self interest in a fuller life, made possible through the attainment of a high level of personal well-being, will motivate lay participation in this altruistic yet practical objective.

Preliminary Report of Committee to Consider Red Cross Blood Bank Program

Pursuant to action of the House of Delegates at the Cleveland Interim Session, the Board of Trustees appointed a committee to act as a liaison between the American Medical Association and the American Red Cross Blood Bank Program. This committee has been active, and the Board has received from its chairman the following report:

The undersigned members of your Committee in liaison with the American Red Cross National Blood Program held a two day meeting, April 2 and 3, with officers of the medical department of the American National Red Cross, the Executive Committee of its Advisory Board on Health Services, and its Committee on Blood and Blood Derivatives and Subcommittee on Blood and Blood Derivatives. The numerous implications of the National Blood Program have been explored in detail, and there have been full and frank discussions in detail with the aforementioned representatives of the objections and criticism which the Committee has been able to assemble.

As a result of these deliberations the Committee believes that there have arisen some misunderstandings and apprehensions which demand immediate clarification.

Scope of Need for Blood

The need for blood procurement falls into three general categories: (1) local procurement for local continuing needs; (2) procurement for disaster relief in peacetime, and (3) procurement for single or multiple wartime disaster. The first of the mentioned needs is met in varying degrees by existing facilities in many communities. A further discussion of this need is found in an accompanying statement which the members of this Committee as individual physicians have prepared in collaboration with a number of other physicians familiar with the field. Needs in the second and third classifications require the integration of existing facilities with other facilities which must be established on a nationwide basis. Further explanation on this subject is likewise found in the accompanying statement.

To this classification of need should be added the need of facilities for obtaining and processing blood for derivatives for both research and treatment. Further must be added the present necessity for supplying blood to veterans' hospitals and the potential necessity, at any time, to supply blood and blood products to the armed forces.

Agencies for Meeting the Needs

Blood is procured at present chiefly in three ways: (1) the nonprofit voluntary blood banks; (2) the blood banks already operating in some communities by cooperation between the Red Cross, local medical societies and hospitals (the so-called "permissive" program of the Red Cross, not to be confused with the National Blood Program), and (3) the National Blood Program centers, six of which are already in operation in the following places: Rochester, N.Y.; Wichita, Kan.; Stockton, Calif.; Atlanta, Ga.; Massachusetts State Program, and Washington, D.C., Washington operating as a local program now, to be approved as part of the national program April 15. The Committee believes that all these existing facilities taken together are accomplishing only a portion of the civilian need and a very small percentage of the potential need. It is further convinced that there is a real possibility that hurried expansion may be forced on us at any time. The Committee believes that the Red Cross has no intention of attempting to activate centers for blood where existing facilities meet the general need and has positive assurance to this effect from all concerned. Furthermore, in no community will it establish a center unless the county medical society or societies concerned request Red Cross assistance and give full support to the program. The following statement by Dr. Ross T. McIntire, administrator of the program, is evidence of this:

> The program is not designed to interfere with existing blood banks already meeting community needs for blood. Rather, the program is established in specific localities only after thorough investigation indicates there is a need for blood, that facilities for supporting the program are adequate, and that the local medical society, the health department and the hospitals are in full accord. Where existing blood banks wish to be integrated with the National Blood Program every effort will be made for them to do so.

The possible urgent necessity for such a nationwide pooling of resources influenced the Committee to request the Red Cross to confer with representatives of existing blood banks regarding a basis of affiliation which would assure a general integrated program and to include in the discussion the subject of standards of procedure and technics which would make it effective.

Because of its experience in the procurement and processing of blood during World War II and its national organization and resources, the Committee is satisfied that no other organization is in as favorable a position to conduct such a program as the American National Red Cross.

Physicians should be impressed with the importance of the following two points: (1) that no local program can or will be instituted by the Red Cross without the approval of the local county medical society, and (2) that in the interest of national defense each county medical society should immediately examine the adequacy of the blood supply in its area.

A report adopted by the House of Delegates in January 1948 reads as follows:

"*Resolutions on Red Cross Blood Program.*—Your reference committee recommends to the House of Delegates continued approval of the 'approval in principle resolution' passed in June 1947 in regard to the establishment of blood banks by the American Red Cross, provided that the American Red Cross accept the following principle: To insure safety to recipients, the responsibility for technical details must rest on properly trained personnel under the control of local or state medical societies."

The Committee is convinced that the American National Red Cross agrees with this principle and will so instruct its local chapters in order that difficulties which have arisen in the past will be corrected and avoided in the future.

The Committee recognizes that the Red Cross cannot make a charge for blood and blood products supplied through its national blood centers; it believes that all physicians should likewise recognize this principle. Existing local blood programs not involved in the Red Cross National Blood Program need make no change in their existing policies; they may be affiliated in the future with the Red Cross program on a basis yet to be determined.

The Committee submits the following recommendation: (1) that the action of the House of Delegates of June 1947 and January 1948 constitutes an adequate statement of the position that the American Medical Association should maintain in regard to the Red Cross Blood Program; (2) that early publication of this report and its accompanying statement be made in THE JOURNAL, and (3) that wide distribution of the material in these documents be made to the officers of all county and state medical societies and to the editors of their journals.

The Committee will continue to work closely with the Advisory Board on Health Services of the American National Red Cross in the future development of the program and will make further reports and recommendations to the Board of Trustees as may become appropriate.

Respectfully submitted,

A. S. GIORDANO, Chairman
JOHN W. GREEN.
LEONARD W. LARSON.
HERBERT P. RAMSEY.
RALPH T. B. TODD.

Statement on the National Need for Blood Transfusion

The last ten years have seen a constantly increasing experience with blood banks in the civilian medicine of the United States. As preserved blood has become available for immediate use in a hospital, the number of blood transfusions has invariably doubled or tripled, regardless of the former provisions for obtaining fresh blood.

From the best available data in this country, it is now estimated that from 4 to 5 pints of blood are required yearly per each hospital bed. This means that a hundred bed hospital will require from 400 to 500 whole blood transfusions annually; in a two hundred bed hospital the requirement is 800 to 1,000 transfusions. There are approximately 6,000 hospitals in the United States but not over 1,200 blood banks. It is obvious from these data and from direct inquiry that a great many patients are not receiving blood because modern transfusion facilities are not available in many localities.

Most of the improvement in transfusion facilities in the past has been accomplished by the establishment of blood banks in individual hospitals or communities. In general, these not only have given excellent service but have stimulated much of the research in the field of blood transfusion.

Naturally, one method of meeting the national need for blood transfusions is the multiplication of the small unit banks along the pattern previously developed. But this ignores another possible function of blood banks, namely, the pooling of the resources of many widely separated communities in time of disaster, either from natural causes or from war. The responsible physician must visualize and prepare for the possibility that his community may be stricken suddenly with a tornado, a flood, a fire or perhaps an atomic bomb. The normal stocks of blood in the local banks will be insufficient or may be completely wiped out or rendered unfit for use from radioactivity. The blood stocks of other communities must then be called on during the emergency. Unless all these cooperating communities have an integrated organization and similar transfusion equipment, the aid will not be efficient or adequate.

Furthermore, the eventuality must be visualized when thousands of pints of blood will be required for one locality within a period of twelve to twenty-four hours. This amount would exceed the total stock kept for normal civilian needs, and therefore thousands of donors in remote communities would have to be bled for the emergency. Only with a going integrated national program can such facilities be provided. The organization for the procurement of donors must be in existence before the catastrophe. Thousands of sterile transfusion flasks, needles, and equipment for the collection and administration of blood must be stock-piled in advance for such an emergency. If the blood is transported across state boundaries, technical standards observed in collection and processing legally must be approved by the National Institute of Health.

The American National Red Cross is, in our opinion, the logical organization to develop and maintain an integrated program of blood procurement on a national scale. It had the wartime experience of obtaining and processing over thirteen million bleedings, an operation unparalleled in the history of medicine. It is incorporated by act of Congress and specifically charged with certain duties to civilians in time of disaster. Also, it has specific responsibilities toward the armed forces and the veterans. It is supported by the contributions of the American people by small individual donations and therefore is a unique agent of the people.

In June 1947 the Red Cross inaugurated a National Blood Program which proposes to fulfil the needs which have been outlined in this communication. It plans to operate only in those communities where its services are requested and has no intention of curtailing existing blood banks which are meeting community needs. It is an integrated national program based on community and regional blood banks. The program has gotten under way slowly because of insistence on the highest possible technical standards in the operation of each center serving a community. The initiative for setting up a center in a community should come jointly from the local chapter of the Red Cross and the county medical society, which is responsible for the appointment of an advisory committee to nominate the technical director of the center and to continue to advise him in its operation. Further, the program must be set up locally in collaboration with the hospital council or individual hospitals and in conformity with standards set by the health department. Mobile units to collect blood in the surrounding territory operate from each center, and blood from the center is provided to hospitals in the region served by the plan. The local chapter of the Red Cross is responsible for donor recruitment and for volunteer services at the center and with the mobile units. The National Red Cross is concerned with the raising of funds, advise on technical problems through its Advisory Board on Health Services, maintenance of high technical standards through the national organization and the integration of these community programs. In the event of a national emergency it would also be responsible for getting blood to wherever it was needed and providing an adequate supply of blood for the armed forces. Furthermore, it is important that as soon as possible representatives of the local nonprofit blood banks meet with the American National Red Cross in order to discuss means of integration in case of emergency.

As physicians who are interested in better medical care and in the welfare of the country in peace and in war, it is our considered opinion that the National Blood Program of the American National Red Cross is the best plan so far devised to integrate local facilities, including private and hospital banks, for blood transfusion, into a program of national scope which will serve the country in peace and in war. It represents a challenge to the medical profession, to public spirited citizens and to medical scientists to pool their efforts cooperatively for the welfare of the people.

Conclusion

The Board of Trustees has fulfilled in so far as has been possible during the year the directions and mandates given by the House of Delegates at the Atlantic City Annual Session and the Cleveland Interim Session. Various committees requested have been appointed and are at work; some if not all of them will have reports ready for presentation to the House at the Chicago Session. A more complete report on these matters than can be given here will be included in the Handbook of the House of Delegates.

ADDENDA TO REPORT OF BOARD OF TRUSTEES

Report of the Committee on Scientific Research for 1947

Nineteen new grants were made, amounting to $14,680. Sixteen grants were closed. Work is in progress under twenty-five grants.

The needs of support of research by small grants described in applications as well as the results of work aided by small grants indicate that for the present the work of the committee should be continued on about the same scale as in recent years. Accordingly it is suggested that for 1948 $12,550 be appropriated for grants in aid of medical research and $1,200 for the expenses of the committee.

The financial statement for 1947 is presented, also lists of grants pending and closed.

A fairly full statement about the work of the committee from its beginning is made in Dr. Fishbein's "History of the American Medical Association."

Respectfully submitted,

Committee on Scientific Research of the American Medical Association.

E. W. Goodpasture, Nashville, Tenn.
Term expires, 1952.

Ludvig Hektoen, Chicago.
Term expires, 1951.

Martin H. Fischer, Cincinnati.
Term expires, 1950.

N. W. Jones, Portland, Ore.
Term expires, 1949.

John J. Morton, Rochester, N. Y.
Term expires, 1948.

FINANCIAL STATEMENT FOR 1947

Balance, Jan. 1, 1947	$ 5,691.98	
Donation to Brant Fund	1,859.49	
Appropriation for 1947	12,550.00	
Refund, grant 616, Robert S. Dow	65.71	
Refund, grant 662, Katharine M. Howell and Elta Knoll	31.31	
Refund, grant 670, Wilbur Thomas	48.00	
Refund, grant 689, Israel S. Kleiner and Arnold Schein	267.28	
Refund, grant 701, Rollin A. Daniel Jr. and F. T. Billings	111 25	
Refund, grant 704, Archie R. Tunturi	379.15	
		$21,004 17

GRANTS PAID IN 1947

Grant 708, Otto Saphir	$ 1,103.50	
Grant 709, Roger M. Reinecke	500.00	
Grant 710, Israel Davidsohn	800 00	
Grant 711, L. R. Cerecedo	600 00	
Grant 712, James H. Leathem	500 00	
Grant 713, H. O. Burdick	200.00	
Grant 714, Ernest A. Spiegel	600 00	
Grant 715, Ben Vidgoff	500 00	
Grant 716, Ruth Silberberg	1,000.00	
Grant 717, Harold J. Harris	2,860.00	
Grant 718, Preston E. Harrison	1,191.50	
Grant 719, J. W. Stutzman	1,000.00	
Grant 720, Donald E. Olson	375.00	
Grant 721, Alfred Appelbaum	600.00	
Grant 722, Peter Gruenwald	450.00	
Grant 723, Albert Milzer	500.00	
Grant 724, Clarence Cohn	400.00	
Grant 725, Milton G. Levine and Robert E. Hoyt	500.00	
Grant 726, Ulrich Friedemann	1,000.00	
		$14,680.00
Balance, Dec. 31, 1947		$ 6,324.17

COMMITTEE EXPENSE

Appropriation for 1947	$1,200.00
Clerical expense, printing	643.93
Unexpended amount, canceled	$ 556.07

GRANTS OF COMMITTEE ON SCIENTIFIC RESEARCH

New Grants—1947

Grant 708: Otto Saphir, Michael Reese Hospital, Chicago, $1,103.50, study by serial sections of axillary lymph nodes for metastatic carcinoma.

Grant 709: Roger M. Reinecke, University of Minnesota, $500, renal gluconeogenesis in various species.

Grant 710: Israel Davidsohn, Mount Sinai Hospital, Chicago, $800, relation of Rh antibodies to fetal erythroblastosis.

Grant 711: L. R. Cerecedo, Fordham University, $600, vitamin B deficiencies in rats and mice.

Grant 712: James H. Leathem, Rutgers University, $500, antihormones.

Grant 713: H. O. Burdick, Alfred University, $200, effect of desoxycorticosterone acetate and progesterone on pregnancy.

Grant 714: Ernest A. Spiegel, Temple University, $600, effect of thalamic lesions on behavior.

Grant 715: Ben Vidgoff, University of Oregon, $500, tests for antidiuretic hormone.

Grant 716: Ruth Silberberg, Barnard Free Skin and Cancer Hospital, St. Louis, $1,000, influence of dietary factors on skeletal aging with particular reference to osteoarthritis.

Grant 717: Harold J. Harris, New York, $2,860, brucellosis.

Grant 718: Preston E. Harrison, Baylor University, $1,191.50, coproantibody in enteric infections.

Grant 719: J. W. Stutzman, Boston University, $1,000, role of visceral afferent impulses in increasing the irritability of the heart

Grant 720: Donald E. Olson, University of Oregon, $375, studies on the suppressor areas of the cerebral cortex of the dog.

Grant 721: Alfred Appelbaum, St. Francis Hospital, Lynwood, Calif., $600, ocular toxoplasmosis.

Grant 722: Peter Gruenwald, Long Island College of Medicine, $450, effect of nitrogen mustard on embryonic development of the mouse.

Grant 723: Albert Milzer, Michael Reese Hospital, Chicago, $975, fungi in acute diseases of the upper part of the respiratory tract in children.

Grant 724: Clarence Cohn, Michael Reese Hospital, Chicago, $400, intermediary nucleoprotein metabolism.

Grant 725: Milton G. Levine and Robert E. Hoyt, College of Medical Evangelists, $500, commercial Rh antiserums.

Grant 726: Ulrich Friedemann, Jewish Hospital of Brooklyn, $1,000, pathogenesis of tetanus.

STATE OF GRANT-AIDED WORK

Grants Closed During 1947

Grant 582, 1940: Charles W. Greene, Stanford University, $500, physiology of the coronary system in monkeys. Refund $160.48. Results not published.

Grant 584, 1940: Oscar V. Batson, University of Pennsylvania, $200, nystagmus. Refund $128.21. Results not published.

Grant 605, 1941: Harry G. Day, Indiana University, $400, physiologic significance of zinc. Day, H. G., and Skidmore, B. E.: Some Effects of Dietary Zinc Deficiency in the Mouse, *J. Nutrition* **33**: 27, 1947.

Grant 616, 1941: Robert S. Dow, University of Oregon Medical School, $250, effects of clotting in cerebral veins. See grant 566, 1940. Refund $65.71. Results not published.

Grant 650, 1942: Tuberculosis Committee, Minnesota State Medical Association, J. A. Myers, chairman, $1,000, tuberculosis survey of Meeker County, Minn. Danielson, K. A.: The Meeker County Tuberculosis Control Project, *Minnesota Med.* **30**: 635, 1947.

Grant 670, 1944: Wilbur Thomas, Bowman Gray School of Medicine, $300, experimental cardiac rupture. Refund $48.00. Thomas, W.: Clinicopathologic and Experimental Observations on the Pathogenesis of Rupture of the Heart Due to Myocardial Damage, *Am. J. Path.* **23**: 904, 1947.

Grant 685, 1944: Daniel J. Glomset, Des Moines, Iowa, $500, cardiac conduction. See grant 629, 1942. Glomset, Daniel J., and Birge, Richard F.: A Morphologic Study of the Cardiac Conduction System: IV. The Anatomy of the Upper Part of the Ventricular Septum in Man, *Am. Heart J.* **29**: 526, 1945. Glomset, D. J., and Birge, R. F.: A Morphologic Study of the Cardiac Conduction System: V. The Pathogenesis of Heart Block and Bundle Branch Block, *Arch. Path.*, accepted for publication.

Grant 687, 1945: Barnett Sure, Arkansas Agricultural Experiment Station, Fayetteville, $600, effect of sulfonamide drugs on thiamine and riboflavin metabolism. Sure, B.: Availability of Vitamins in Foods and Food Products: III. Riboflavin Balances with Liquid Milk, Dried Skimmed Milk and Evaporated Milk, and the Influence of Succinyl Sulfathiazole on Such Balances, *Arch. Biochem.* 12: 389, 1947.

Grant 689, 1945: Israel S. Kleiner and Arnold H. Schein, New York Medical College, $400, nutritive value of intact protein compared with the products of its enzymatic and acid hydrolysis. Refund $267.28. Results not published.

Grant 691, 1945: David J. Sandweiss, Thomas L. Patterson and Harry C. Saltzstein, $1,200, relation of the endocrine glands to gastric secretion. See grant 674, 1944. Kaulbersz, J.; Patterson, T. L.; Sandweiss, D. J., and Saltzstein, H. C.: Urine Extracts of Hypophysectomized Dogs Administered in Different Periods of a Double Histamine Experiment, *Federation Proc.* **6**: 140, 1947; Patterson, T. L.; Kaulbersz, J.; Sandweiss, D. J., and Saltzstein, H. C.: Different Periods of Administration of Enterogastrone and Urogastrone in Double Histamine Experiments, *ibid.* **6**: 177, 1947; Kaulbersz, J.; Patterson, T. L.; Sandweiss, D. J., and Saltzstein, H. C.: Urine Extracts of Thyroidectomized Dogs and Gastric Secretion, abstracted, Proceedings of the International Physiological Congress, 1947, p. 372; Patterson, T. L.; Kaulbersz, J.; Sandweiss, D. J., and Saltzstein, H. C.: Gastric Secretory Effects of Urogastrone and Enterogastrone from Hypophysectomized Dogs, *ibid.*, p. 380.

Grant 693, 1946: Catharine Macfarlane, Women's Medical College of Pennsylvania, $1,774.50, value of periodic pelvic and breast examinations for cancer. Macfarlane, C.: Cancer Prevention Clinics, *J. Am. M. Women's A.* **1**: 2, 1946.

Grant 695, 1946: Reuben Mokotoff, Montefiore Hospital, New York, $900, relation to edema of renal clearance in congestive heart failure. Mokotoff, R.: Renal Plasma Flow and Sodium Reabsorption and Excretion in Congestive Heart Failure, *J. Clin. Investigation*, accepted for publication.

Grant 696, 1946: James H. Leathem, Rutgers University, $500, antihormones. See grant 712, 1947. Leathem, J. H.: Further Studies on Antigonadotropic Formation Following Gonadotropic Hormone Administration, *Am. J. Physiol.* **148**: 700, 1947.

Grant 698, 1946: Paul F. Hahn, Vanderbilt University, $500, radioactive manganese in Hodgkin's disease, leukemia, lymphoma, etc Sheppard, C. W.; Well, E. B.; Hahn, P. F., and Goodell, J. P. B.: Studies of the Distribution of Intravenously Administered Colloidal Sols of Manganese Dioxide and Gold in Human Beings and Dogs Using Radioactive Isotopes, *J. Lab. & Clin. Med.* **32**: 274, 1947.

Grant 701, 1946: Rollin A. Daniel Jr. and F. T. Billings, Vanderbilt University, $250, quinacrine in the treatment of tuberculosis. Refund $111.25. Results not published.

Grant 708, 1947: Otto Saphir, Michael Reese Hospital, Chicago, $1,103.50, study by serial sections of axillary lymph nodes for metastatic carcinoma. Saphir, O.: Obscure Axillary Lymph Node Metastasis in Carcinoma of the Breast, *Cancer*, accepted for publication.

WORK IN PROGRESS, 1947

Grant 479, 1937: Tracy, J. Putnam, Boston City Hospital, $200, injuries to the cervical portion of the cord.

Grant 504, 1938: Wallace M. Yater, Georgetown University Medical School, $500, histopathology of bundle branch block.

Grants 518, 1938, and 559, 1939: Harold D. West, Meharry Medical College, $150, synthesis of *di*-threonine.

Grant 570, 1940: William H. Sweet, University of Chicago, $300, course of nerve fiber tracts of the temporal lobe.

Grant 607, 1941: Fritz Levy, Davis Memorial Hospital, Elkins, W. Va., $250, study of marrow cells. Levy, Fritz: Megakaryocytes and Blood Platelets, *Am. J. Clin. Path.* **15**: 154, 1945.

Grant 626, 1942: Peter P. H. de Bruyn, University of Chicago, $400, study of osteogenic substance in laying birds.

Grant 643, 1942: Milton Mendlowitz, Mount Sinai Hospital, New York, $500, digital circulation (Special Cardiac Research Fund).

Grant 647, 1942: Walter Schiller, Chicago, $250, ovarian tumors. See grant 532, 1939. Schiller, W.: Local Myelopoiesis in Myeloid Leukemia, *Am. J. Path.* **19**: 809, 1943.

Grant 656, 1943: Warren O. Nelson, Wayne University, $300, lipids in the adrenal cortex. Refund $133.08. See grant 481, 1937.

Grant 661, 1943: Roland K. Meyer, University of Wisconsin, $500, antihormones. McShan, W. H.; Wolfe, Harold R., and Meyer, Roland K.: Factors Affecting the Action of Antigonadotropic Sera in Immature Rats, *Endocrinology* **33**: 269, 1943. Wolfe, Harold R.; Meyer, Roland K., and McShan, W. H.: The Negative Phase in the Antigonadotropic and Precipitin-Productive Activities in Rabbits, *J. Immunol.* **50**: 349, 1945.

Grant 677, 1944: J. LeRoy Conel, Harvard Medical School, $500, postnatal development of the human cerebral cortex (Charles A. Brant Fund).

Grant 681, 1944: W. E. Garrey, Vanderbilt University School of Medicine, $500, innervation of the heart in vertebrates.

Grant 682, 1944: Helen Ingleby, $500, problems of cystic disease and carcinoma of the breast.

Grant 690, 1945: Leo L. Hardt, Loyola University School of Medicine, Chicago, $250, improvements of flexirigid gastroscope. See grant 673, 1944.

Grant 692, 1946: Wesley Spink, University of Minnesota, $500, brucellosis. Hall, W. H., and Spink, W. W.: In Vitro Sensitivity of Brucella to Streptomycin; Development of Resistance During Streptomycin Treatment, *Proc. Soc. Exper. Biol & Med.* **64**: 403, 1947.

Grant 694, 1946: L. R. Cerecedo, Fordham University, $600, vitamin B deficiencies in rats and mice.

Grant 699, 1946: Bernard N. E. Cohn, National Jewish Hospital, Denver, $250, experimental bone tuberculosis.

Grant 700, 1946: Harold J. Harris, New York, $2,600, diagnosis and treatment of brucellosis. See grant 717, 1947.

Grant 702, 1946: Hans Popper, Cook County Hospital, Chicago, $1,000, morphology of the liver in relation to function (Charles A. Brant Fund).

Grant 703, 1946: Frederick H. Howard, Lincoln Hospital, New York, $600, vectocardiographic research.

Grant 704, 1946: Archie R. Tunturi, University of Oregon, $600, acoustic system of the dog. Refund $379.15.

Grant 705, 1946: Hovey Jordan, University of Vermont, $450, project method in the teaching of histology.

Grant 706, 1946: Rachmiel Levine, Michael Reese Hospital, Chicago, $1,000, secretion and metabolism of progesterone in threatened abortion. See grant 684, 1944.

Grant 707, 1946: A. M. Lassek, Medical College of the State of South Carolina, $2,000, degenerative phenomena in the pyramidal tract. See grant 671, 1944. Lassek, A. M.: The Pyramidal Tract: Speed of Degeneration in Axons Following Ablation of Cells of Origin in the Monkey, *J. Comp. Neurol.* **83**: 45, 1946; Lassek, A. M.: The Human Pyramidal Tract: XV. A Study of Axons in Selected Cases with Congenital Cerebral Malformations, *ibid.* **85**: 477, 1946.

Committee on Therapeutic Research

The Committee on Therapeutic Research, a standing committee of the Council on Pharmacy and Chemistry, encourages scientific investigations in the field of therapeutics by providing funds for the prosecution of necessary research.

During the year the Committee issued eighteen grants. A detailed list of these grants, together with a list of publications during 1947 and of unexpended grants made before Jan. 1, 1947, follows.

New Grants—1947

Grant 583: Paul J. Hanzlik and R. H. Dreisbach, Stanford University School of Medicine: the intravenous use of quinine, $200.

Grant 584: Gladys R. Bucher, University of Illinois Division of Biological Sciences: uropepsin in the urine, $150.

Grant 585: Maria Wiener Kirber, Woman's Medical College of Pennsylvania, and Werner Henle, University of Pennsylvania School of Medicine, the complement fixation reaction in epidemic influenza, $350.

Grant 586: Harold D. Green, Wake Forest College, Bowman Gray School of Medicine, the role of the liver and kidneys in shock, $500.

Grant 587: Richard C. de Bodo, New York University College of Medicine, the antidiuretic action of some depressants of the central nervous system, $500.

Grant 588: Richard C. de Bodo, New York University College of Medicine: the role of gluconeogenesis and carbohydrate utilization in insulin hypersensitivity, $500.

Grant 589: Thomas G. Morrione, University of Vermont College of Medicine, cirrhosis of the liver, $500.

Grant 590: Fred D. Weidman, University of Pennsylvania School of Medicine, torulosis, $400.

Grant 591: Gregory Pincus, Worcester Foundation for Experimental Biology, the mechanism of action of gonadotropin, $2,400.

Grant 592: Sidney C. Werner and Edith Quimby, Columbia University College of Physicians and Surgeons, radioactive iodine in the diagnosis and treatment of toxic goiter, $500.

Grant 593: Robert Chambers, New York University College of Medicine, capillary fragility, $500.

Grant 594: Windsor Cutting, Stanford University School of Medicine, chemotherapy of virus infections, $500.

Grant 595: J. Murray Luck, Stanford University School of Medicine, the use of low-salt human serum albumin for the relief of hypoproteinemia and edema, $500.

Grant 596: Victor Ross, Columbia University College of Physicians and Surgeons, (1) preparation of a Schick toxin which will not require the use of a control solution; (2) preparation of protamine-diphtheria and protamine-tetanus toxoids, $350.

Grant 597: Lloyd D. Seager, Woman's Medical College of Pennsylvania, pharmacology and toxicology of the diamidines, $500.

Grant 598: Ewald E. Selkurt, Western Reserve University School of Medicine, renal physiology, $500.

Grant 599: David F. Marsh and Clark K. Sleeth, West Virginia University School of Medicine, the quantitative aspects of the well known tachyphylaxis that occurs with repeated administration of such drugs as amphetamine, ephedrine, "tuamine" and "propadrine," $400.

Grant 600: Lester M. Morrison, College of Medical Evangelists, cholesterol metabolism of patients who have survived myocardial infarction and those who have died of this disease at the Los Angeles County General Hospital, $500.

The following is a list of the investigations conducted with the assistance of grants made by the Committee on Therapeutic Research, reports of which were published during 1947:

Uropepsin: A Review of the Literature and Report of Some Experimental Findings, Gladys R. Bucher: Gastroenterology 8:627 (May) 1947.

Disappearance of Uropepsin from the Urine of Gastrectomized Cats, Gladys R. Bucher and A. C. Ivy: Am. J. Physiol. 150:415 (Sept.) 1947.

Quantitative Study of Collagen Content in Experimental Cirrhosis, Thomas G. Morrione: J. Exper. Med. 85:217 (March 1) 1947.

Influence of Body Temperature and of Temperature of Traumatized Tissues upon Local Edema and Survival of Dogs Subjected to Ischemic Compression Trauma of Their Hind Extremities, Edgar L. Lipton, Adam B. Denison and Harold D. Green: Federation Proc. (March) 1947.

Absence of Any Influence of Heparin upon Ischemic Compression Shock Studied at Various Environmental Temperatures, J. R. R. Bobb and Harold D. Green: Federation Proc. (March) 1947.

Ischemic Compression Shock; Influence of Body Temperature and of Temperature of Traumatized Tissues, Edgar L. Lipton, Adam B. Denison, and Harold D. Green: Am. J. Physiol. 150:693 (Oct.) 1947.

Effect of Ergotamine Tartrate on Potassium Changes in Histamine Shock, Caroline tum Suden: Proc. Soc. Exper. Biol. & Med. 64:464, 1947.

Effect of Adrenocortical and Sympathico-Adrenal Factors on the Cardiovascular Sensitivity to Potassium in the Rat, Caroline tum Suden: Am. J. Physiol. 149:589 (June) 1947.

On the Mode of Action of Penicillin, L.O. Krampitz and C.H. Werkman: Arch. Biochem. 12:57 (Jan.) 1947.

The Effect of Digitalis on the Fluid Distribution of the Body, Carrol A. Handley and Jane Telford: J. Pharmacol. & Exper. Therap. 89:97 (Jan.) 1947.

Relations Between Cutaneous Blood Flow and Blood Content in the Finger Pad, Forearm and Forehead, A. B. Hertzman, W. C. Randall and K. E. Jochim: Am. J. Physiol. 150:122 (July) 1947.

A Comparison of the Bronchodilator Activity of Benadryl With Some of its Derivatives and Certain Other Substances, Fred W. Ellis: J. Pharmacol. & Exper. Therap. 89:214 (March) 1947.

The Effect of Sulfonamide Administration on Cardiac Function in the Dog, Roberta Hafkesbring and Grace E. Wertenberger: Am. Heart J. 33:84 (Jan.) 1947.

Further Localization and Analysis of Adrenergic Synaptic Inhibition, Amedeo S. Marrazzi and Rose N. Marrazzi: J. Neurophysiol. 10:167 (May) 1947.

Treatment of Graves' Disease with Radio Iodine (I^{131}), Mayo H. Soley and Earl R. Miller: Chicago M. Soc. Bull. 50:290 (Oct. 18) 1947.

A New Method of Semen Analysis, Edmond J. Farris: Anat. Rec. 97:429 (March) 1947.

An Improved Method for Semen Analysis, Edmond J. Farris: J. Urol. 58:85 (July) 1947.

Studies of the Capsular Substance of Torula Histolytica and the Immunologic Properties of Torula Cells, Albert M. Kligman: J. Immunol. 57:395 (Dec.) 1947.

Comparison of the Time Concentration Curves in Arterial Blood of Diffusible and Non-Diffusible Substances When Injected at a Constant Rate and When Injected Instantaneously, W. F. Hamilton and J. W. Remington: Am. J. Physiol. 148:35 (Jan.) 1947.

Rheumatic Fever Recurrences in Children Without Sulfonamide Prophylaxis: *An Evaluation of Environmental* Factors, Robert L. Jackson, Helen G. Kelly, Cecilia Healy Rohret and Julia M. Duane: J. Pediat. 31:390 (Oct.) 1947.

Chemotherapy of Virus Infections, Windsor C. Cutting and others: J. Immunol. 57:379 (Dec.) 1947.

Penicillin Therapy in Bacterial Asthma, Frieda Baumann, Jean Crump, Ann C. Arthurs, Lloyd D. Seager and Ruth E. Miller: J. Am. M. Women's A. 2:442 (Oct.) 1947.

A Method and Observations on Capillary Fragility in Rabbits, Robert Chambers and Alfred L. Copley: Federation Proc. (March) 1947.

Retinal Sensitivity Contours in Retinitis Pigmentosa. I. Sensitivity to White Light, Charles Haig and Samuel L. Saltzman: Federation Proc. (March) 1947.

Attempted Infection of the Hen and Man with the Sporozoites of Plasmodium Cathemerium 3-H-2, Harry Beckman: Proc. Soc. Exper. Biol. & Med. 66:401, 1947.

Toxicity of "Stilbamidine", Lloyd D. Seager and Gina Castelnuovo: Arch. Path. 44:287 (Sept.) 1947.

Influence of BAL on the Acute Toxicity of Gold Salts in Mice, Rollan Swanson, Joseph Ney and Paul K. Smith: Federation Proc. (March) 1947.

The following grants were issued before Jan. 1, 1947. In some cases the grant has expired and an unexpended balance remains, or the work is not yet completed, or not yet published.

Grant 408: Ephraim Shorr, Cornell University Medical College, the effect of progesterone on the vaginal smear, $300.

Grant 443: A. B. Baker and Raymond N. Bieter, University of Minnesota Medical School, toxic effects of sulfanilamide and derivatives on nervous system and effect of vitamin B complex in prevention of such injuries, $500.

Grant 454: W. L. Mendenhall and Albert J. Plummer, Boston University School of Medicine, the quantitative determination of theophylline, $50.

Grant 455: Frederick H. Pratt and Marion A. Reid, Boston University School of Medicine, the effect of cardiac drugs on the denervated lymphatic hearts, $100.

Grant 459: Mary E. O'Sullivan, Bellevue Hospital, New York, the therapeutic effect of estradiol in muscular dystrophy, $100.

Grant 474: Arthur C. DeGraff, New York University College of Medicine, the effectiveness of sodium thiosulfate and sodium formaldehyde sulfoxalate in treatment of cardiac arrhythmias induced experimentally by mercurial diuretics, $400.

Grant 484: Alfred Goerner, Long Island College of Medicine, and M. Margaret Goerner, Brooklyn Thoracic Hospital, the toxic action of carcinogenic compounds on liver tissue, $400.

Grant 488: L. R. Kaufman, New York Medical College, circulatory competence of the intestine in cases of intestinal obstruction, $125.

Grant 489: L. R. Kaufman, New York Medical College, the use of enzyme mixture for dissolving slough, $100.

Grant 550: C.A.Handley and S.A.Peoples, Baylor University College of Medicine, water distribution of the body following the administration of digitalis, $150.

Grant 553: Adrian C. Kuyper, Wayne University College of Medicine, a procedure for the detection and determination of unidentified plasma constituents, $375.

Grant 558: Howard Glass, Marquette University School of Medicine, the comparative effect of "dermol" and morphine on the resistance of anoxia of rabbits from the onset of viability to adult life, $250.

Grant 561: G.L.Cantoni, Long Island College of Medicine, the mechanism whereby potassium exerts its effect on the intact smooth muscle, $400.

Grant 562: Grace E. Wertenberger, Woman's Medical College of Pennsylvania, cardiac physiology as revealed by the electrocardiogram during serum sickness and sulfonamide hypersensitivity reactions, $500.

Grant 563: Gregory Pincus, Worcester Foundation for Experimental Biology, standardization of chorionic gonadotropin, $1,016.

Grant 564: F.E.Kelsey, University of Chicago, the effect of drugs on phosphorus metabolism, $500.

Grant 565: Gregory Pincus, Worcester Foundation for Experimental Biology, the mechanism of action of the gonadotropic hormone, $2,100.

Grant 569: Samuel L. Saltzman and Charles Haig, New York Medical College, the therapy of retinitis pigmentosa, $500.

Grant 498: Linn J. Boyd and Kurt Lange, New York Medical College, the effect of cold in the treatment of shock, $300.

Grant 499: Joseph Litwins, New York Medical College, the chemistry and hematology of blood donors, $200.

Grant 506: Andrew F. Burton, Howard University School of Medicine, (1) the distribution of sulfanilamide in maternal and fetal tissues at various stages of pregnancy; (2) the toxic effects of quinine on the fetus in utero, $600.

Grant 514: Morton McCutcheon, University of Pennsylvania School of Medicine, the toxicity of sulfonamide drugs and penicillin and the mechanism of chemotaxis in leukocytes, $150.

Grant 516: Nellie Perry Watts, Woman's Medical College of Pennsylvania, methods to prolong the action of local anesthetic drugs, $250.

Grant 525: Herbert Silvette, University of Virginia Medical School, the effect of low barometric pressures on kidneys previously damaged, either surgically or by drugs, $250.

Grant 528: Linn J. Boyd and Kurt Lange, New York Medical College, capillary permeability of the meninges in meningitis and meningisms, $350.

Grant 529: Linn J. Boyd and Kurt Lange, New York Medical College, the effectiveness of physiotherapeutic measures in peripheral vascular diseases, $350.

Grant 531: Thomas H. McGavack, New York Medical College, the absorption of compressed pellets of the steriod hormones, $400.

Grant 532: Thomas H. McGavack, New York Medical College, inulin and "diodrast" clearances in endocrine diseases, $250.

Grant 533: Robert S. Teague, University of Alabama School of Medicine, the metabolism of diethylstilbestrol and its derivatives with emphasis on the ration of absorption, the distribution, fate and excretion of these drugs, $500.

Grant 534: Stephen P. Jewett, New York Medical College, the use of ammonium chloride in psychiatric disorders, $350.

Grant 538: Thomas H. McGavack, New York Medical College, water balance under the influence of various hormones, $200.

Grant 542: Woman's Medical College of Pennsylvania, the use of penicillin therapy in intrinsic (bacterial) allergy with chronic infection of the sinuses, $500.

Grant 543: Harold D. Green, Wake Forest College, Bowman Gray School of Medicine, the influence of environmental temperature of ischemic compression shock, $400.

Grant 547: L.M.N.Bach, Tulane University of Louisiana School of Medicine, the effect of certain hormones on the renal tubules, $150.

Grant 570: F. William Sunderman, University of Pennsylvania, Pepper Laboratory of Clinical Medicine, the use of congo red in measuring serum volume and in detecting amyloidosis, $400.

Grant 571: Edmond J. Farris, Wistar Institute of Anatomy and Biology, and Boland Hughes, University of Pennsylvania School of Medicine, the effects of endocrines and other substances on spermatogenesis in males with low sperm counts, $1,200.

Grant 572: C. H. Werkman, Iowa State College, Department of Bacteriology, the mechanism of action of penicillin and streptomycin, $1,000.

Grant 573: Joseph L. Lilienthal Jr., Johns Hopkins Hospital, relation of the enzyme system to pathophysiology of muscle and nerve function, $500.

Grant 574: E. A. Evans Jr., University of Chicago, Department of Biochemistry, biochemical study of the cellular mechanism for protein synthesis, $500.

Grant 575: Tom Addis, E. Barrett, L. J. Poo, L. Way and W. Yuen, Stanford University School of Medicine, reasons for the differences in the effects of various proteins on the rate of growth of the kidney, $1,000.

Grant 576: Harold D. Green, Wake Forest College, Bowman Gray School of Medicine, the effects of heparin on traumatic shock, $300.

Grant 578: Aaron E. *Margulis, New York Post-Graduate* Medical School and Hospital, bacteriophage phenomenon, $1,000.

Grant 579: Aaron E. Margulis, New York Post-Graduate Medical School and Hospital, experimental and clinical endocarditis, $1,000.

Grant 581: Victor Ross, Columbia University College of Physicians and Surgeons, Schick toxin and protamine-tetanus toxiod, $350.

Grant 582: Allan D. Bass, Syracuse University College *of Medicine, vascular disease and hypertension, $500.*

TREASURER'S REPORT

Report of the Treasurer of the American Medical Association for the Year Ended December 31, 1947

Investments (at cost) as at January 1, 1947..	$4,624,832.41	
Bonds purchased (at cost).................	1,036,341.63	
	$5,661,174.04	
Less:		
Bonds called, matured or sold............	1,258,340.34	
Investments as at December 31, 1947........		*$4,402,833.70*
Balance for Investment January 1, 1947....	$ 119,252.63	
Interest received on Investments in 1947....	109,845.94	
	$ 229,098.57	
Transferred to General Fund..............	$ 195,000.00	
Uninvested Funds at December 31, 1947....		$ *34,096.57*
Invested and Uninvested Funds as at December 31, 1947..		$4,436,932.27

◆

DAVIS MEMORIAL FUND

Balance in fund January 1, 1947............	$ 8,003.11	
Interest earned on bank balance in 1947.....	100.34	
Funds on deposit at December 31, 1947......		$ 8,103.45

AMERICAN MEDICAL ASSOCIATION RESEARCH FUND

Investments (at cost) as at January 1, 1947..		*$1,499,512.50*	
Bonds purchased (at cost).................		350,000.00	
		$1,849,512.50	
Less:			
Bonds sold		$ 361,500.00	
Investments as at December 31, *1947*.......			*$1,488,012.50*
Uninvested funds as at January 1, *1947*......		487.50	
Add:			
Excess of proceeds over cost of bonds sold	$11,500.00		
Less:			
Loss on exchange of securities...	*2,437.50*		
		9,062.50	
Uninvested funds at December 31, 1947......			9,550.00
Invested and Uninvested funds as at December 31, 1947..			$1,497,562.50

Interest earned on investments and transferred to *General Fund* to apply on Research expenditures.	$ 34,423.96

JOSIAH J. MOORE, Treasurer.

AUDITOR'S REPORT

January 30, 1948.

To the Board of Trustees,
American Medical Association,
Chicago, Illinois.

Dear Sirs:

We have examined the balance sheet of the American Medical Association, Chicago, Illinois, as of December 31, 1947, and the statement of income for the year ended on that date, have reviewed the system of internal control and the accounting procedures of the Association and, without making a detailed audit of the transactions, have examined or tested accounting records and other supporting evidence, by methods and to the extent we deemed appropriate except as hereinafter stated regarding confirmation of receivables and observation of the inventory taking.

The cash and bank balances have been confirmed by count or by certificates from the depositaries. The United States Government and other marketable securities were confirmed by an acknowledgment from the Continental Illinois National Bank and Trust Company of Chicago where the securities are held for safekeeping.

We did not independently confirm the accounts receivable by communication with the debtors. The accounts receivable were reviewed as to age and collectibility and, in our opinion, the balances are fully realizable. We reviewed the plan and system of control adopted for inventory taking but we did not observe the taking of the inventories nor did we make tests of the physical existence of the quantities recorded.

Expenditures charged to property and equipment accounts during the year, in our opinion, were properly capitalized as representing additions or improvements. The provision for *depreciation for the year appears to be adequate.*

All ascertained liabilities have been included in the accounts. Attorneys for the Association state that no litigation was pending *against the Association as of the balance sheet date.*

In our opinion, subject to the exceptions set forth in paragraph three, the accompanying balance sheet and related statement of *income present fairly the position of the Association at December* 31, 1947, and the results of the operations for the year, in conformity with generally accepted accounting principles.

Fidelity insurance is carried on all officers and employees under a comprehensive form policy covering loss through dishonesty, forgery, etc., in amounts ranging from $2,500.00 to $50,000.00 (depending upon nature of loss) for each individual.

We have pleasure in reporting that the books are well maintained and that every facility was afforded us for proper conduct of the examination.

Yours truly,
PEAT, MARWICK, MITCHELL & Co.

Loss on sale of equipment		2,355.38
Loss on metal dross sales		526.78
		2,844,174.99
Depreciation (based on estimated remaining life):		
Buildings	$23,479.60	
Machinery	15,289.89	
Type and factory equipment	1,837.66	
Furniture and equipment	9,824.18	50,431.33
		2,894,606.32
Deduct—Proportion of overhead expenses charged to other publications and departments		54,261.86
Total		$2,840,344.46

NOTE.—Total wages and salaries for year 1947 amounted to $2,347,671.00. Of this amount $1,295,221.77 is included above, $680,186.86 is shown in Schedule "2" (expense of Councils, Bureaus, Association and Special Committees) and the remainder, $372,262.37, was disbursed in connection with the 18th Edition of the American Medical Directory, now in preparation, and with the printing of books, reprints, pamphlets and printing in process at the close of the year.

Schedule "2"

EXPENSES OF COUNCILS, BUREAUS AND COMMITTEES

FOR THE YEAR ENDED DECEMBER 31, 1947

Salaries and wages	$ 680,186.86
Office printing and binding	34,843.72
Office supplies and repairs	19,368.27
Express, telephone and telegraph	8,788.48
Postage	16,733.93
Books and periodical subscriptions	*2,373.75*
Legislative services	5,222.85
Statistical data	21,801.00
Miscellaneous expenses	12,614.29
Educational material distributed	10,709.95
Staff travel	61,267.52
Radio broadcasting and electrical transcriptions	73,825.25
Inspection of hospitals and medical schools	9,926.53
Educational exhibits	14,408.60
Trustees' meeting expenses	17,044.53
Grants, tests and investigations	35,840.03
Section secretaries' conference and honorariums	3,589.43
State secretaries' conference	9,858.64
Council and Bureau conferences	28,485.18
Sundry committee expenses	61,538.84
Total	$1,128,427.65

NOTE.—The above expenses are spread ove [illegible] following Councils, Bureaus, and Committees as indicated: Associa [illegible] $ [illegible] of Health Education, $151,293.46; Council on [illegible] $109,421.37; Chemical Laboratory, $28,774.32; [illegible] cine, *$34,547.62*; Council on Foods and Nutrition, $24,[illegible]; [illegible] on Therapeutic Research, $13,391.66; Council on Medical Education and Hospitals, $101,987.33; Bureau of Legal Medicine and Legislation, $37,206.41; Bureau of Investigation, $8,836.51; Bureau of Medical Economic Research, $89,436.49; Council on Industrial Health, $47,055.92; Association and Bureau of Exhibits, $50,906.07; Council on Medical Service, $121,887.59; Committee on Industrial and Personnel Relations, $17,166.33.

REPORT OF THE JUDICIAL COUNCIL

To the Members of the House of Delegates of the American Medical Association:

During the past year the work of the Judicial Council has been divided between the usual matters that are presented in accordance with its duties as outlined in the By-Laws and the study of the revision of the Principles of Medical Ethics which was assigned to it at the annual session in San Francisco in 1946.

Three meetings have been held since the Atlantic City Session, two in Chicago on Nov. 12, 1947 and March 14, 1948 and one in Cleveland in January in conjunction with the Interim Session of the House of Delegates. All the routine matters usually presented to the Council were disposed of satisfactorily. These consisted of many letters asking for information concerning the application of different principles to certain acts either committed or contemplated. They were answered by some member of of the Council, giving the decision of the entire Council. The nominations and recommendations of candidates for Associate Fellowship were considered and decided. Also all candidates for Fellowship whose applications were questioned were examined and finally accepted or rejected.

There was one appeal heard in January at Cleveland. This appeal was from the decision of a component county medical society which refused membership to a group engaged in a local insurance medical service. The appeal was accepted inasmuch as several of those engaged in this service were Fellows of the American Medical Association through affiliation with another state association. They joined this insurance group with the knowledge that they would be barred from membership in the county society. Under the By-Laws of the American Medical Association, a Fellow moving to another state and failing to become a member of a component society within twelve months loses his Fellowship. However, he has the right of appeal to the Judicial Council. The Council may give an opinion but has no power whatsoever to compel a component society either to accept or to reject a candidate for membership. The interesting part of this appeal is that these members were operating an insurance medical service which was conducted without any regard for the ten principles outlined by the American Medical Association. They neither gave free choice of physicians nor permitted the participation of any hospital other than the one operated by the group. There was no criticism from either side regarding the men involved; therefore, the appellants were advised to join the state insurance group, to provide free choice of physicians and to arrange for the use of such hospitals as were approved by the local profession so that they might regain or maintain membership in organized medicine. The Council understands that conferences are now taking place to adjust this matter.

Revision of Principles of Medical Ethics

The most important work of the Judicial Council during the year was a revision of the Principles of Medical Ethics in accord with the mandate of the House of Delegates at San Francisco. The draft of the revised principles constitutes a part of this report although not included herewith. Mimeographed copies were sent to the members of the House of Delegates before the annual session in order that the delegates might have ample time for a careful study and that acceptable changes which might otherwise obstruct or delay the routine procedure of the House may be dealt with before the session and thus facilitate action. This is especially urgent since in addition to the usual business of the House, the revision of the Constitution and By-Laws will be again presented

It might not be amiss at this time to review the existing Principles of Medical Ethics with a view to their value to the medical profession, the reason for their being and the background of their development. The principles of proper behavior in practically any walk of life, and particularly in the profession of medicine, are both timeless and immutable. In reviewing the history of present ethical principles, their existence even before they were ever formulated or put into print is noted. Members of the medical profession have always adhered to certain concepts of ethics. They are formally phrased in the Constitution of the American Medical Association, which reads:

> The objects of the Association are to promote the science and art of medicine and the betterment of public health.

In the Principles of Medical Ethics of the American Medical Association they are phrased as follows:

> A profession has for its prime object the service it can render to humanity; reward or financial gain should be a subordinate consideration. The practice of medicine is a profession. In choosing this profession, an individual assumes an obligation to conduct himself in accord with its ideals.

This language did not constitute an original promulgation at the time it was first uttered as a canon of ethics. It was merely the crystallization of the characteristics of behavior of the best medical practitioners at all times and in all ages, embodied formally in the foregoing words. These considerations are presented for the purpose of making the point that it is nothing new in medical tradition for emphasis to be placed on the maintenance of standards. Medicine would not have advanced through the centuries if this had not always been the motive activating the physician.

The first printed code was published by Dr. Thomas Percival of England in 1803. He was asked to arbitrate the differences between two members of the staff of the hospital with which he was associated and after settling this dispute became exceedingly interested in the welfare of the medical profession and its future development. In 1792, at the request of a group associated with the Manchester Infirmary, he began to compose a series of ethical principles as a guide to the members of his profession. After some years, and helped by the criticism of his friends, he revised and published the manuscript. In 1823 the New York State Medical Society adopted a series of principles of ethics and in 1832 the Baltimore Medical Society did likewise. Both of these series were practically the same as Dr. Percival's original principles of ethics. Finally, at the first national medical convention, which assembled in New York in 1846, the following resolution was introduced:

> That it is expedient that the medical profession in the United States should be governed by the same code of medical ethics, and that a committee of seven be appointed to report a code for that purpose at a meeting to be held in Philadelphia on the first Wednesday of May 1847.

The resolution was adopted, and a committee was appointed with Dr. Isaac Hays as chairman. In presenting his report to the convention on June 5, 1847 Dr. Hays stated that his committee, after a careful examination of the codes then in practice in a large number of states, found them to be based almost entirely on that of Dr. Thomas Percival. He further reported that the language of this original document was preserved, in most instances, to a considerable extent, not only because of its precision and clarity but also because of its merit as recognized by the approval and adoption of the other committees. Nevertheless, the principles were modified somewhat in 1880 and rewritten in 1903. Since that time some important additions have been made. Those of considerable importance to the profession are the principles concerning advertising, solicitation of patients, contract practice and the splitting of fees. In recent years there have been several attacks on these principles as they now stand, and requests have been received that they be completely revised. The complaints in the main are that the language is not clear and that the principles are difficult to interpret. In the same measure it is well to realize that this criticism may apply to the laws enacted by the different legislatures of this nation. It is practically impossible to write a law or principle of ethics in such terms that it will be correctly interpreted by all. As a matter of fact, when a law is passed by the legislature and signed by the governor, it is not a law in many cases until a court test has been made and an official interpretation given by the judge. The function of the Judicial Council is to interpret the Principles of Medical Ethics, and the Council is willing at all times to interpret them and to express its opinion as to their application to any specific case. Many times, however, these letters by their very tone make the Council believe that the writers are trying to get an interpretation outside the meaning of the Principles for their own personal advantage. It might be well to note here that the Council has never had a case which could not be settled within the present Principles of Medical Ethics, and the Council's interpretation has never been particularly difficult or ever questioned.

The high opinion of the medical profession as held by the public is due in large measure to the whole-hearted manner in which the great mass of physicians have accepted the Principles of Medical Ethics and conducted their professional life in accordance with them. This is true also of physiians who are not even members of the Association. The Principles have always emphasized the dignity of the medical profession and have insisted that the physician give his great concern to the advancement of public health and the observance of the law. The present Principles of Medical Ethics stress first the duties of the physician to his patient. They remind him of the full responsibility that is his once he has accepted the patient. They also point out that the physiian is free to choose whom he will serve but that he should also respond to any request for assistance in times of emergency or whenever temperate public opinion expects the service. This responsibility for the patient also demands that the physician keep the public welfare in mind and that in a situation where the patient may be a menace to the public, being a possible cause of an epidemic, the public welfare must be paramount. The success of medical practice has depended on the confidential relationship between physician and patient. Every article in the Principles of Medical Ethics is predicated on and stresses that relationship. The Principles also call on the physician to protect his patient and to arrange for necessary consultations when the physician thinks they may be helpful. The Council repeats that the Principles have always insisted that the duty of the physician is first to the patient, second to the public and third to the proper relationship with his fellow members of the profession. These last instructions are well explained in the present day Principles and are especially important to the young physician as a guide to his proper conduct. Finally, these Principles of Medical Ethics distinguish the members of the medical profession from the cultists and charlatans. It might be well to quote at this time a statement issued by the Judicial Council at the San Francisco Session in 1938:

> The ethics of medicine is stated as it should be in principles of conduct instead of rules. To define and interpret these principles so as to cover every relation of the medical man would be to set up an endless system of rules, regulations and laws approaching in character a criminal code, with its invitation to violation by sophisticated reasoning or through technicality. A rule, regulation or law may be circumvented, but the principle underlying the law cannot be avoided by such means. As occasion arises, amendments will doubtless be made in the future as they have in the past, but these are strenuous times of rapid and radical change and no one can predict the immediate or remote future.

It is still the unanimous opinion of the Judicial Council that the ethics should be written as principles and not as laws, and that these principles should be as broad as possible. It is a well known fact that some of the state medical associations have their own principles of ethics and rules of conduct. These differ in many cases from the Principles of the parent organization in that they may be more specific and vary according to local custom. They must not, however, contravene the Principles of Medical Ethics of the American Medical Association. Enforcement of the ethics of medicine is a function of the component societies and constituent associations. Penalties or punishment for violation of the Principles of Medical Ethics of any state society or of the American Medical Association must be determined and applied by (the state society involved. The Judicial Council is an appeal court and of itself has no punitive power for violation of ethical principles. For many years the Principles of Medical Ethics have been the bulwark on which the great reputation of the medical profession has been established, and they should be modified only with great caution.

Resignation of Dr. Lloyd Noland.

During the past year the Judicial Council has suffered a great loss in the resignation of a long-standing member, Dr. Lloyd Noland. This action was due to a temporary illness, which unfortunately did not respond to treatment as rapidly as expected and made his attendance at meetings impossible. Dr. Noland became a member of the Council in 1935, serving a two year term through 1937. He was again appointed in 1943 and has remained a member since that date. During the years of his membership he attended all meetings but one. His experience, sound judgment and deep understanding of the principles which underlie the conduct of a professional man made him one whose opinions were always received with careful consideration. His behavior in all instances was a worthy model for the younger men of the profession. He had the happy faculty of liking people and never failed to give generous evidence of his sincere regard for them. During the years of his service, his valuable contribution to the work of the Council has made an indelible impression on its members. The Council regrets his decision to retire but hopes and believes that he will soon be returned to health and once more be found active among his friends in the profession

The President of the Association, Dr. Edward L. Bortz, has appointed Dr. Homer L. Pearson of Miami, Fla., to fill the place of Dr. Noland on the Council until the Chicago Session in June. Dr. Pearson has already attended one meeting of the Council.

Respectfully submitted,

EDWARD R. CUNNIFFE, Chairman; HOMER L. PEARSON; JOHN H. O'SHEA; LUIS A. BUIG; WALTER F. DONALDSON.

REPORT OF COUNCIL ON MEDICAL EDUCATION AND HOSPITALS

To the Members of the House of Delegates of the American Medical Association:

The major concerns of the Council on Medical Education and Hospitals during the past year have been with the projected survey of medical education, the training of general practitioners, the extent to which the facilities for medical education in this country are meeting the nation's needs for physicians, the financial support of medical schools and the supply and distribution of interns.

Survey of Medical Education

A year ago the Board of Trustees approved the recommendation that a complete survey of the medical schools of the United States be undertaken and voted to provide the required financial support. During the course of the year the Council has enlarged its view of the scope that might reasonably be established for the survey. This broader view is reflected in the fact that the survey is now designated as a Survey of Medical Education rather than a Survey of Medical Schools.

The Council has recognized that the proper organization of this survey and a clear definition of its objectives is a heavy responsibility. In its report to the House of Delegates last year the Council discussed the great benefit that would result if the survey were conducted jointly with the Association of American Medical Colleges. The Board of Trustees has approved the recommendation of the Council that the survey be conducted by a Committee sponsored jointly by the Council on Medical Education and Hospitals and the Association of American Medical Colleges. To date this committee has been occupied with formulating the objectives of the survey, determining the general program for its conduct and selecting the full time personnel who will carry out the survey.

The future course of medical education in this country during the next fifteen to twenty years will probably be influenced to a significant degree by the results and recommendations of this survey. It is frequently stated that there has been no fundamental change in the medical curriculum in the past forty or fifty years. It is true that undergraduate medical education has been conducted within the framework of four academic years since 1893. Within that framework, however, such profound changes have occurred and are continuing to occur in the length of the academic year, in the content of the curriculum and in methods of instruction that any resemblance between the medical school course of today and that of forty or fifty years ago is limited largely to superficial characteristics.

It is generally agreed, however, that the time is appropriate to reexamine carefully both the methods and objectives of medical education so that a clear view may be obtained of the extent to which medical education has been adapted to modern needs and of the extent to which additional modifications of traditional practices are desirable.

Training of General Practitioners

The increased interest in specialization during recent years has appeared at times to have resulted in a lack of interest in the development of programs for the training of physicians who plan to enter the general practice of medicine. It is encouraging, therefore, to report that a number of medical schools are already conducting programs specifically designed to stimulate an interest in general practice among students and that many of the other schools are studying the problem with genuine interest in the expectation of fostering similar developments in the near future. Whether coincidentally or because of these efforts, reports are being received from several schools that the percentage of students expressing a desire to enter general practice is increasing.

The Council is also studying with deep interest the number of internship and residency programs that are being developed for the specific purpose of preparing physicians for general practice. The number of such opportunities that are developed will be an important factor in attracting young physicians to careers in general practice. In conducting the annual census of hospitals during the past year the Council sought information which would indicate to what extent the hospitals are organizing training programs for general physicians. When this information has been compiled, more detailed studies will be made with a view to accumulating as much information as possible concerning current trends in this field.

Because of the importance of the subject, it was arranged to have two papers presented at the Annual Congress on Medical Education and Licensure describing programs that have been established for the training of general practitioners at the undergraduate and internship levels.

It seems clear that interest in training general practitioners will continue to grow. One basic question to which an answer is needed is, "What fields of medicine will be the province of the general practitioner or family physician who ministers to the next generation?" On the answer to this question will depend to a large extent the direction in which programs for training the general practitioner will develop.

The Supply of Physicians

During the past year wide publicity has been given in the lay press to forecasts by the United States Public Health Service that a serious shortage of physicians will occur by 1960. The Council has been concerned that these forecasts would result in pressure being brought to bear on the medical schools of the country to accept more students than they can properly train, since the medical schools are already operating at maximum capacity. There is evidence that certain schools have already been subjected to such pressure. Agitation for the establishment of substandard medical schools is another consequence to be feared from such forecasts.

The Council believes that alarm over the supply of physicians is unwarranted. The current rate of production of physicians is the highest in history, and the physician population of the country is increasing at a relatively more rapid rate than the general population. Representatives of the Council have met frequently with officials of the Public Health Service in an effort to persuade them that pronouncements of physician shortages based on estimates in which hypotheses loom large will be distorted and used to support movements that will result in a lowering of the standards of medical education and ultimately of medical care. The Council is hopeful that as a result of these conferences, the Public Health Service appreciates the serious consequences that the approach they have adopted may have on the quality of medicine in the United States. The Council will continue to be interested in this problem. One of the objectives of the survey of medical education will undoubtedly be to determine how effectively present and projected facilities for medical education can meet the nation's demand for physicians.

Financial Medical Education

The maintenance of a high quality of medical education depends largely on the adequacy of the financial support provided the medical schools. The operating budgets of the medical schools are at present at an all time peak. A survey conducted by the Council revealed that the budgets of the medical schools, exclusive of the costs of patient care and special research funds from outside sources, totalled more than $43,000,000 for the current academic year. Of this amount, students' fees provide only 28 per cent or less. For the purpose of comparison it may be pointed out that this is an increase of approximately $20,000,000 over the funds available to the medical schools twelve to fourteen years ago. Although some of this increase in financial support has been neutralized by the current inflation, the additional funds that have been made available have enabled almost every school to strengthen greatly its educational program during the past decade. It seems clear that at present medical education in the United States is at the most advanced point of development that it has yet achieved. There is grave concern, however, that unless additional financial support is provided further advance will be difficult and a regression in the quality of medical education may even be observed, particularly if inflation continues. The Council shares this concern and therefore arranged to devote one session of the Annual Congress on Medical Education and Licensure to the subject of the financial support of medical education.

The speakers discussed in detail the financial needs of the medical schools and agreed that additional support is clearly required. There was general agreement that, except for the possibility of emergency grants in aid, the medical schools should not seek federal support until the possibilities of private support have been completely exhausted. President Alan Valentine of the University of Rochester presented statistics to show that "there is in private pockets more than enough (money) to finance painlessly the added costs of medical education." He appeared to express the general sentiment when he stated, "We must act with private enterprise on private enterprise. In that effort lies the free and unfettered future of medical education and medical care."

On the same subject Chancellor Harvie Branscomb of Vanderbilt University stated, "Federal funds can be just as enervating to the medical schools as they have been in some other quarters. If the schools begin to look to the federal government to pay them out of their difficulties, I am afraid of the effect on them—not only that they will be reduced to a sort of dead level of uniformity but that much of the sense of initiative and development which has characterized these schools will tend to disappear. The temptation will be to wait for federal agencies to put the funds out to start new departments and new services."

There is already evidence that certain governmental agencies are prepared to urge the federal government to provide financial assistance to the medical schools. In a speech delivered Feb. 17, 1948 Mr. Oscar Ewing, Administrator of the Federal Security Agency, stated: "I am convinced that federal aid to medical schools and to medical students is essential if we are to have the doctors necessary for the health and well-being of our people."

The Council believes that the question of the future financing of medical education presents a serious problem. It has recommended to the Board of Trustees that the American Medical Association give serious thought to initiating a sustained campaign to inform the citizens of the nation that more generous support of the medical schools from private sources is urgently needed.

Supply and Distribution of Interns

A variety of circumstances has led to a progressive increase in the number of approved internships offered by the hospitals of the country during recent years. Some of the increase has resulted from the placing of additional hospitals on the list of institutions approved for internship training. Another major influence has been the fact that many hospitals now accept more interns than they did formerly. Numerous factors have contributed to this latter development. Some hospitals require more interns because they have enlarged their facilities. Certain hospitals need more interns than formerly because they have established programs for rotating interns with other hospitals. In other instances hospitals have increased their intern staff with a view to providing a more reasonable ratio of interns to patients.

Because of the growing importance of the problem, the Council's staff has been engaged during the past year in a study of the trends in the distribution of interns. This study, which was published in the Internship and Residency Number of The Journal, revealed that as of April 1, 1948, 748 hospitals in the continental United States approved for internship training offered a total of 8,609 individual internships. The hospitals reported that 6,902 interns were actually on duty, indicating that 80 per cent of the available internships were filled.

One third of all hospitals reported no internship vacancies, and another 22 per cent reported that they had more than three fourths of their full complement of interns. Twenty per cent reported that between one half and three fourths of their internships were filled. Twenty-five per cent of the hospitals had less than half of their internships filled, including 12 per cent which reported that they had no interns. Of the 87 hospitals that constituted this latter group, 57 had one or more residents, so that only 130 of the 748 hospitals studied were without any house staff. It would thus appear that while there are considerably more internships available than there are interns, a fairly broad distribution of interns obtains.

As might be expected, the survey revealed that the larger hospitals and the teaching hospitals had the fewest vacancies. Fifty-eight per cent of the teaching hospitals had their full complement of interns, while of the nonteaching hospitals only 26 per cent reported no vacancies. Conversely, only 4 per cent of the teaching hospitals reported no interns, while 14 per cent of the nonteaching hospitals were without interns.

Of the large nonteaching hospitals of four hundred and fifty beds or more, 47 per cent had their full complement of interns and none were without interns. On the other hand, of the nonteaching hospitals of one hundred and fifty beds or less, only 23 per cent had their full quota of interns and 21 per cent had no interns.

It is of interest to compare the present situation with that obtaining in 1939. In that year 734 hospitals in the United States offered 7,707 internships and reported that 7,204 (93 per cent) of the internships were filled.

The larger number of interns available reflects the fact that more men served a second year of internship in 1939 than in 1947. The smaller number serving a second year of internship in 1947 was due at least in part to the fact that approximately 3,000 physicians who had been enrolled in the A. S. T. P. and V-12 programs in medical school entered the armed services in that year at the completion of their first year of internship. The growing trend for physicians to enter residency training after one year of internship was another factor that led to a smaller number of second year interns. With respect to this development, it should be pointed out that many first year residents actually perform the same work previously carried on by second year interns. It is thus evident that a mere comparison of the numbers of interns available in 1939 and 1948 would be misleading in comparing the amount of internship service enjoyed by hospitals in the two periods under consideration.

This study has just been completed. The Council intends to review it carefully to see if the data obtained warrant any changes in the Council's policy with respect to the approval of internships. In considering the problem of the distribution of interns, the Council believes it important that full recognition be given to the principle that the primary purpose of the internship is to provide educational experience. The service that an intern renders to a hospital, while important, must be regarded as a secondary consideration. The Council feels very strongly that it would be unwise to support any policy that might impede recent graduates from obtaining training in those hospitals that are outstanding for the quality of their educational programs to the full extent that such hospitals can satisfactorily accommodate them.

In approving hospitals for internship training, the Council has proceeded in the past on the principle that it should not attempt to limit or restrict the number of hospitals receiving its approval but should grant approval to any hospital that meets its minimum standards. In other words, the Council has encouraged a system of enterprise and free competition. While the Council believes that its standards of an approved internship have been appropriately high, it recognizes that considerable variation is to be found in the quality of the training offered by institutions on its approved list. The Council, therefore, should perhaps consider revising its standards with the intention of developing a smaller list of hospitals that offer internships that are definitely of a superior quality.

Uniform Intern Placement Plan

Three years ago the Association of American Medical Colleges formulated a plan establishing a uniform date for the appointment of interns by hospitals. This plan was endorsed by the American Hospital Association, the Protestant Hospital Association, the Catholic Hospital Association of the United States and Canada, and the Council on Medical Education and Hospitals.

The purpose of this plan was to eliminate the practice that a number of hospitals had fallen into of offering appointments to medical students early in their undergraduate course, in many cases even before they had completed the second year. It was the general belief of medical educators and hospital administrators that if this practice extended the whole situation with respect to internship appointments would become chaotic to the great disadvantage of both hospitals and prospective interns.

Adherence to the plan by hospitals has been of necessity on a voluntary basis. The only element of control is that exercised by the deans of the medical schools in not releasing students' credentials before a fixed date. In general, hospitals have abided faithfully by the provisions of the plan, although a small percentage are known to have offered appointments in advance of the specified date. While there have been criticisms of the plan, it has worked well on the whole, and no better mechanism has been suggested for accomplishing the purpose for which the plan was devised.

The following plan for appointments to internships beginning July 1, 1949 was adopted by the Association of American Medical Colleges in October 1947 and was subsequently endorsed by the Council on Medical Education and Hospitals and the other organizations referred to previously:

1. Applications and credentials to be submitted only through the dean's office to hospitals, with the date for filing applications and release of credentials by the medical schools set at Oct. 15, 1948. Credentials ordinarily will consist of an executed application blank and a letter from the dean but do not preclude such letters from members of the faculty as they may wish to write, unsolicited by the candidates.
2. Applicants may visit hospitals and be interviewed by hospital intern committees, but the hospital administration shall not commit the hospital or obligate the applicant, or potential applicants, before Nov. 15, 1948.
3. No intern appointments shall be made prior to Nov. 15, 1948 from applicants who are members of the senior class in medical school. Hospitals may decline an applicant at any time.
4. Applicants shall accept or reject hospital appointments before midnight of Nov. 18, 1948.
5. These regulations shall apply only to undergraduate medical students who have not completed the fourth year of their medical school courses.

Residency Training Program

A definite increase in the facilities for residency training is still taking place. In last year's annual report it was stated that as of April 1, 1947, 10,422 residency positions were available. By April 1, 1948 the figure had increased to 15,154. New applications for approval of residencies are still being received, so it seems likely that the maximum development of facilities for residency training has not yet been reached. There is no way to accurately determine the current demand for residency training beyond observing that few residencies are unfilled.

Because of the rapid expansion of residency training programs at the cessation of hostilities, a system of granting temporary approval to residencies was inaugurated early in February 1946 to hasten the opening up of suitable training opportunities for veteran physicians. Temporary approval is granted with the concurrence of the American Board concerned on the basis of data supplied by the hospital and other information about the hospital that is available to the Council and the Board. As soon as possible, residencies holding temporary approval are inspected by the Council; a decision is then reached as to whether to grant permanent approval or to withdraw approval. By April 1, 1948 a total of 1,136 residency programs had been granted temporary approval. A large number of these programs have already been surveyed by the Council in relation to permanent approval and the Council is making an extended effort to complete the survey of the programs still holding temporary approval at the earliest possible date. In recent months the staff of the Council, which was depleted during the war, has been augmented so that good progress should be made in this work. Even with the larger staff, however, it is unlikely that all residencies holding temporary approval can be surveyed in much less than two years.

Survey of Residencies in Orthopedic Surgery

During the course of the present year the Council collaborated with the American Orthopedic Association and the American Academy of Orthopedic Surgeons in a review of all the residencies in orthopedic surgery that had been approved on either a permanent or temporary basis by the Council with the concurrence of the American Board of Orthopedic Surgery. This study was financed by the American Medical Association as a pilot experiment designed to evaluate the system employed by the Council in appraising residencies.

This system may be summarized as follows: Hospitals seeking approval of residencies in the specialties make application to the Council on duplicate forms setting forth essential data with respect to the hospital and the particular service or services for which approval is desired. The staff of the Council then reviews the information set forth and any additional information that it possesses about the hospital and the service in question. The hospital and the service are then surveyed at an early date by a member of the Council's professional staff. A report of the survey is then prepared, together with the recommendation of the staff, and forwarded with one copy of the completed application to the American board for the specialty in question. The board, after reviewing this material, in turn submits its recommendation to the Council, which then determines whether or not approval is to be granted. When it is impossible to arrange for an early survey of a hospital requesting residency approval, one copy of the application form together with any additional information that is available is transmitted at once to the American board. When its recommendation has been returned, the Council then decides whether temporary approval should be granted until such a time as the hospital can be surveyed.

In general this plan has worked well and has appeared to be satisfactory. From time to time, however, the Council has thought that it would be of value to determine how well the evaluation of the residency programs in a given specialty made by its professional staff would compare with that made by men who have specialized in the particular field. An excellent opportunity to do this was afforded by the survey of residencies in orthopedic surgery. This survey was carried out by twenty-eight of the leading orthopedic surgeons of the country, each of whom visited and made a detailed report of the residency training programs in a group of hospitals located in an area other than his own.

The results of the survey were exceedingly gratifying to the Council, for they indicated that by using well defined objective criteria its professional staff had been able to form evaluations of residency training programs in a special branch of medicine that were substantially corroborated by experts in the field. The survey included 137 residency services that had previously been given permanent approval by the Council and the American Board of Orthopedic Surgery following an inspection by the staff of the Council. After reinspecting these hospitals, the orthopedic surgeons recommended that approval be withdrawn from only 3, or 2.2 per cent of the total. As would have been expected, it was found that a somewhat higher percentage of those hospitals which had not been previously inspected and which held only temporary approval from the Council and the Board were not judged worthy of continuing approval. Of the 101 residencies holding temporary approval, it was recommended that approval be withdrawn from 14.

The Council realizes that if similar surveys were made in other fields, such extremely close agreement might not always be found. However, this experiment would seem to indicate clearly that the present system of evaluating residencies, which in almost all specialties includes consultation and the exchange of recommendations with the American board in question, is a sound and practical one. While some slight advantage might accrue from having on the staff of the Council a specialist in each branch of medicine, such an arrangement is obviously not practical and, to judge from the results of this study, would not appear to be necessary.

Postgraduate Courses

Interest in postgraduate courses is at an all time peak and appears still to be increasing. During the year July 1, 1947 to June 30, 1948 a total of 1,679 courses are being offered. Last year the reported attendance at postgraduate courses totalled nearly 60,000. State medical socities, medical schools and hospitals are all active in providing leadership in developing this increasingly popular undertaking in medical education.

Hospital Service in the United States

During the past year the Council conducted its annual survey of hospital facilities in the United States. The report of this study reveals a substantial increase in the number of admissions and hospital births in 1947 as compared with the preceding year. The present total of 15,829,514 admissions is an increase of 676,062 in comparison with 1946 but is less than the all time high of 16,257,402 reported in 1945. The principal gain was in the nongovernmental general hospitals, whose admissions increased by 1,038,905 in 1947. The net gain by general hospitals, however, was only 613,687, inasmuch as the admissions in governmental general hospitals were reduced by 425,218. The governmental hospitals as a group showed a decrease of 393,819 admissions, whereas the nongovernmental hospitals had an increase of 1,069,881. In the general hospitals the admissions increased from 14,051,508 to 14,665,195; in the psychiatric institutions from 271,209 to 291,954, while in the tuberculosis sanatoriums there was a slight decrease from 99,741 to 99,080.

Hospital births have shown a steady increase each year with the exception of the wartime year 1944. Yet it was not until 1946, when 2,136,373 were reported, that the number of births in hospitals exceeded 2,000,000. This total is now far surpassed, however, as evidenced by the present report of 2,837,139 hospital births for 1947. Although increased numbers were reported in both the governmental and nongovernmental hospitals, the gain was more pronounced in the latter group, which has a total of 2,395,557 births as compared with 1,801,427 in 1946. Over 97 per cent of the births reported in the present survey occurred in general hospitals.

The number of beds in the hospitals registered by the American Medical Association total 1,425,222, including 1,030,205 in government hospitals and 395,017 in the nongovernmental group. The governmental hospitals, which had a reduction of 273,984 beds in 1946, showed a further decrease of 52,529 in 1947. The nongovernmental hospitals reported a net increase of 9,037. The average bed occupancy increased in all governmental and nongovernmental classifications except in the federal group, where the percentage of beds occupied decreased from 80.6 in 1946 to 78.9 in 1947. As a group the governmental hospitals showed an occupancy rate of 87.8 per cent as compared with 86.6 per cent in the previous year. The corresponding figures for the nongovernmental hospitals are 79.1 and 78.1 per cent, respectively. There was little change in the occupancy rate in the general hospitals, but increases were noted both in the psychiatric and the tuberculosis groups. During the last year the average length of stay in general hospitals was reduced from 12.9 to 11.4 days. In the governmental general hospitals the patients remain an average of 19.5 days, whereas in the nongovernmental general hospitals the average length of stay is only 8.7.

The tremendous volume of hospital service in the United States is also reflected in the average daily census of 1,217,229 reported in 1947. The general hospitals, with 93 per cent of all patients admitted last year, maintained an average daily census of 456,761. The psychiatric hospitals, however, with less than 2 per cent of the admissions, had an average census of 651,578, or 53 per cent of the daily patient load in all registered hospitals.

The total number of patient days in the 6,276 hospitals registered by the American Medical Associatoin in 1947 was 444,288,585.

Approval of American Board of Physical Medicine

During the past year the American Board of Physical Medicine completed its organization and was officially approved by the Council on Medical Education and Hospitals. This board is the sixteenth examining board in the specialties to be approved by the Council. The board has already begun to examine and certify physicians specializing in the field of physical medicine.

Annual Congress on Medical Education and Licensure

The forty-fourth Annual Congress on Medical Education and Licensure was held under the auspices of the Council on Medical Education and Hospitals and the Federation of State Medical Boards in Chicago in February 1948. Papers were presented at this congress on such timely and important topics as the financing of medical schools, the relationship of medical schools to teaching hospitals, the status of legislation for a National Science Foundation, the undergraduate and graduate training of general practitioners, the teaching of the clinical aspects of nuclear energy, the use of medical motion pictures and the teaching of physical medicine and rehabilitation.

Liaison Committee of the Council and the Advisory Board for Medical Specialties

For several years the Council has held annually a joint meeting with the Advisory Board for Medical Specialties. These meetings have been helpful in reviewing problems of mutual concern to the two organizations. During the past year both organizations expressed the belief that even more effective coordination could be achieved if a liaison committee were created that would meet frequently and thus provide a mechanism for a more continuous program of consultation and cooperation. Such a committee, composed of three members from each organization, was established and held its first meeting in February 1948. It is planned that this committee will hold at least three meetings during each year. Among other objectives this committee will attempt to define more clearly the relationship between the Council and the Advisory Board and between the two bodies and the individual American Boards. This committee should also be in a position to make constructive suggestions with respect to many of the general problems related to the specialty movement.

Liaison Committee of the Council and the Association of American Medical Colleges

In February 1942 the Board of Trustees of the American Medical Association authorized the establishment of a liaison committee of the Council on Medical Education and Hospitals and the Executive Council of the Association of American Medical Colleges. This committee, which is advisory to the two associations, has continued to meet two or three times annually to consider problems of mutual concern to the two organizations. This arrangement has been of distinct benefit to both bodies, since it has made possible joint action in important matters pertaining to medical education. Inspections of medical schools have been carried out jointly by the two organizations; joint reports of inspections are submitted to the schools, and identical action has been taken by the two groups in cases that involve the status of a medical school.

Liaison with Government Services

The growing interest of the Army, Navy, United States Public Health Service and the Veterans Administration in developing programs of graduate medical training has resulted in the Council's formation of a close and continuing liaison in an advisory capacity with these services. The relationships have been most cordial, and the Council is pleased to observe that the different services are making effective progress in establishing soundly conceived and carefully organized programs of residency training and postgraduate courses. The government services will undoubtedly find that the attraction of such opportunities for professional development will be of real benefit in recruiting the medical personnel of which they stand in need.

Collaboration with Other Agencies

The Council has continued to collaborate with numerous other agencies in the field of health, medicine and education. These conjoint activities have been varied in nature and have involved the Secretary and other members of the staff of the Council. These cooperative enterprises have included participation in conferences, meetings of advisory committees and joint sessions.

Foreign Medical Schools

Last year's report mentioned the lack of reliable information in this country concerning the present status of foreign medical schools and also mentioned that a committee of representatives from various groups with an interest in this problem had recommended that a survey be made to determine the location and certain basic factual data concerning every existing foreign medical school. During the present year this survey has been initiated. With the cooperation of the Division of International Exchange of Persons of the State Department a questionnaire has been prepared and distributed to each American diplomatic mission abroad. It is hoped that representatives of the state department will arrange to have a questionnaire filled out supplying basic information for each medical school in countries with which the United States has diplomatic relations. The completed questionnaires will be returned to the Council for study and preservation in its permanent files.

The Council has also received valuable assistance in securing information about foreign medical schools from the reports which American physicians traveling abroad have generously furnished the Council concerning medical schools that they have visited during the course of their travels.

A second meeting of the Committee on Foreign Medical Credentials consisting of representatives from the Association of American Medical Colleges, Federation of State Medical Boards, National Board of Medical Examiners, United States Office of Education, State Department and the New York State Education Department was called by the Council in February 1948, and further progress was made in arranging for the collection and exchange of information concerning foreign medical schools. While progress in this field will of necessity be slow, it would appear that in the course of time a significant body of information can be collected concerning foreign medical schools that will be of great value to the several groups in this country which must evaluate the training of students and graduates from these schools.

Medical Schools Visited

During the calendar year 1947 the following medical schools were visited for consultation, survey or other purposes:

Georgetown University School of Medicine
St. Louis University School of Medicine
Washington University School of Medicine
Baylor University College of Medicine
Southwestern Medical College
University of Texas Medical Branch
West Virginia University School of Medicine
Dalhousie University Faculty of Medicine

Inspection of Hospitals and Technical Schools

Inspection of hospitals and technical schools made by the Council during the year 1947 may be summarized as follows:

Intern Training	45
Residencies and fellowships	189
Intern training and residencies	14
Registration	16
Technical schools	6
Spas	3
Total	273
Individual residencies and fellowships investigated	625

Summary of Hospitals and Technical Schools

Figures for approved hospitals and technical schools with changes occurring during the calendar year 1947 are as follows:

Registration of Hospitals	
Hospitals registered, Jan. 1, 1947	6,280
New institutions registered during 1947	176
Closed or transferred to unclassified file	144
Hospitals registered, Dec. 31, 1947	6,312
Internship Approval	
Hospitals approved for intern training, Jan. 1, 1947	811
Approved during year	20
Removed from approved list	19
Hospitals approved for intern training, Dec. 31, 1947	812
Residency Approval	
Hospitals approved for residency training, Jan. 1, 1947	956
Approved during year	151
Removed from approved list	21
Hospitals approved for residency training, Dec. 31, 1947	1,086
Clinical Laboratory Schools	
Approved schools, Jan. 1, 1947	293
Approved during year	15
Removed from approved list	0
Approved schools, Dec. 31, 1947	308
Medical Record Librarian Schools	
Approved schools, Jan. 1, 1947	11
Approved during year	0
Removed from approved list	0
Approved schools, Dec. 31, 1947	11
Occupational Therapy Schools	
Approved schools, Jan. 1, 1947	18

Council Publications

Regular publications of the Council during the year 1947 included:

Hospital Service in the United States
State Board Number of THE JOURNAL
Medical Education in the United States
Proceedings of the Annual Congress on Medical Education and Licensure
Postgraduate Courses for Veteran and Civilian Physicians
Approved Examining Boards in Medical Specialties (A Summary of the Requirements for Certification Established by the American Boards)
A History of the Council on Medical Education and Hospitals
Choice of a Medical School
Approved Colleges of Arts and Sciences
Approved Internships
Approved Residencies and Fellowships in the Specialties
Schools for Clinical Laboratory Technicians
Schools for Physical Therapy Technicians
Schools for Occupational Therapy
Schools for Medical Record Librarians
Schools for X-Ray Technicians

The Council also has reprinted for distribution a number of articles dealing with questions relating to the Council's work and responsibilities. In addition, the Council has published numerous statements in THE JOURNAL from time to time concerning current problems.

Tribute to Dr. John H. Musser

The Council suffered a very real loss in the death of Dr. John H. Musser on Sept. 5, 1947. Dr. Musser was appointed to the Council in 1934 and at the time of his death had just commenced his third term of service. Dr. Musser rarely missed a meeting of the Council. In his deliberations he was unmistakably honest and sincere. He expressed his views with conviction and firmness and, although sympathetic with medical schools and hospitals that were attempting to better their position, was intolerant of inefficiency and chicanery. The Council has faced many serious problems in the past thirteen years. Dr. Musser helped to meet them wisely and courageously. The American Medical Association and, indeed, all American Medicine, owe his memory an unforgettable debt of gratitude.

New Council Member

Dr. Virgil P. Sydenstricker of Augusta, Ga., was appointed by the Board of Trustees to fill the vacancy on the Council created by the death of Dr. Musser until the annual meeting of the House of Delegates in 1948.

Secretary of the Council

Dr. Donald G. Anderson of Boston, who was appointed by the Board of Trustees to succeed Dr. Victor Johnson as Secretary of the Council, joined the Council staff on July 1, 1947.

Professional Staff Changes

Dr. Edward K. Reid of Rome, N. Y., Dr. Edward H. Leveroos of Superior, Wis., and Dr. William W. Corbett of Baton Rouge, La., have been appointed to the professional staff. Dr. Frode Jensen resigned from the staff to become director of graduate and postgraduate medical education at the University of Colorado School of Medicine.

Appreciation

In carrying out its program the Council on Medical Education and Hospitals has enjoyed the fullest cooperation of numerous institutions and organizations, for which it wishes at this time to record its sincere appreciation. The Council is particularly grateful to the officers, trustees and members of the House of Delegates of the American Medical Association for the support and cooperation that they have given to the Council in its many activities.

Respectfully submitted,

H. G. WEISKOTTEN, Chairman.

REPORT OF COUNCIL ON SCIENTIFIC ASSEMBLY

To the Members of the House of Delegates of the American Medical Association:

Interim Report at Cleveland Session

The Council on Scientific Assembly presented an interim report to the House of Delegates at the Cleveland Session Jan. 5, 1948 covering the activities of the Council up to that time. The report called attention to the action of the House of Delegates in June 1947 regarding the creation of a Section on Diseases of the Chest. This portion of the report was referred to the Reference Committee on Amendments to the Constitution and By-Laws, which, recognizing the possible conflict of interpretation between the Constitution and the By-Laws with respect to the creation of new Sections, referred the matter by resolution to the Committee to Study Revision of the Constitution and By-Laws. The resolution was adopted by the House on Jan. 6, 1948.

The Council on Scientific Assembly appreciates the action of the House in its attempt to make the functions of the Council more definitive and will welcome any changes in the Constitution and By-Laws that lead to this end.

Cleveland Interim Session

The Interim Session held in Cleveland January 5 to 8, 1948, presented many problems to the Council. The General Scientific Meetings, arranged with great care and addressed by eminent speakers, were in general poorly attended. The Council has some doubt regarding ability to keep up the highest standard of program planning if more physicians do not attend the lectures at future interim sessions. Even when the meetings were arranged so as not to interfere with sessions of the House of Delegates, few delegates attended. The Council noted, moreover, that the attendance at the Scientific Exhibit was not good and that the entire session, except for the meetings of the House of Delegates, was not entirely satisfactory.

The reasons were not difficult to ascertain: poor timing of the meeting; location in a city already well supplied with frequent and first class postgraduate educational programs; a growing movement to organize general practioners' societies outside of the American Medical Association; the concurrent session of the Congress on Industrial Health; the growth of state programs of a similar nature, and the partial failure to build up an attendance in advance of the meeting.

Interim Session in St. Louis

Plans to insure a successful Interim Session in St. Louis are being given consideration by the Board of Trustees and the Council. The program probably will be built on a basis of fewer formal lectures and more practical demonstrations, small conferences with limited attendance, the use of special features such as television, audience participation programs and evening programs, with motion pictures and other forms of instruction.

Chicago Annual Session

The program for the General Scientific Meetings, prepared by the Council on Scientific Assembly, is offered as part of this report.

Section on Miscellaneous Topics

In the Section on Miscellaneous Topics three sessions for the 1948 Annual Session were approved, one each on Diseases of the Chest, History of Medicine and Allergy. A chairman and secretary for each session was appointed by the Council in accordance with the By-Laws.

An additional session on Physical Medicine was approved by the Council, following sanction by the Board of Trustees, creating, for the Chicago Session, a fourth unit in the Section on Miscellaneous Topics, and a chairman and secretary were appointed for this session.

Changes in Constitution and By-laws

The Council met with the Committee to Study Revision of the Constitution and By-Laws in Cleveland Jan. 5, 1948 and made certain recommendations for revision of the Constitution and By-Laws which will clarify the duties of the Council on Scientific Assembly. The Council has been assured that its recommendations will be incorporated in the revised Constitution and By-Laws which is to be presented to the House of Delegates for action at the Chicago Session.

Section Reorganization

A suggestion was made to the Council that, instead of each section being represented by a delegate in the House of Delegates as is now the case, there be formed a Scientific Representative Assembly of section delegates, each section electing one delegate to that group to consider the problems of the scientific sections, that the Scientific Representative Assembly so formed elect five delegates to represent the scientific sections in the House of Delegates and that there be no more than five delegates from the sections no matter how many sections are established. The Scientific Representative Assembly could also act as a committee to bring up to the Council on Scientific Assembly problems affecting the sections.

The Council presents this suggestion to the House of Delegates for consideration.

Respectfully Submitted,

HENRY R. VIETS, Chairman.
CHARLES H. PHIFER.
LEONARD W. LARSON.
STANLEY P. RIEMANN.
LUKE B. JACKSON.
R. L. SENSENICH, President-Elect ex officio.
MORRIS FISHBEIN, Editor ex officio.
GEORGE F. LULL, Secretary ex officio.

REPORT OF THE COUNCIL ON MEDICAL SERVICE

To the Members of the House of Delegates of the American Medical Association:

The original objectives of the Council on Medical Service continue to guide the Council in its activities. The purpose and functions of the Council have been specifically set forth by the House of Delegates. They are briefly, to follow the trends in medical service, to interpret these trends to the members of the American Medical Association, and to make suggestions as to improvements. It has fallen to the Council to implement the functions and activities of the Association in a variety of ways. In this capacity the members of the Council have often approached tasks with the understanding that if something worth while was created or started it might well be passed on or transferred to some other department or organization. To a certain extent, then, the Council is a testing ground. After testing activities and projects it has been found that some can best be retained and carried on by the Council, some are more suitable to joint efforts with others and some are the proper functions of others.

Community Leadership

Emphasis during 1948 is being placed on community leadership in health problems by the component county medical societies and to a lesser extent by the constituent state medical associations.

County Medical Society Survey.—The first step in in community leadership in health problems is to determine the capacity of county medical societies for promoting this leadership. In order to accomplish this, a pilot questionnaire was sent to two hundred and fifty selected county societies in the forty-eight states. The results of the pilot questionnaire are interesting and show a variety of activities. Full tabulation will be completed and mimeographed when all the answers have been received.

State Medical Society Survey.—As with the county medical societies, it was necessary to know more about the constituent state medical associations. A questionnaire has been forwarded to the secretary of every state association for the purpose of learning more about activities and work of their organizations in the health care field. The information gained from both this and the county medical society questionnaire will enable the Council to act as a clearing house on medical society activities. The demand for this type of service is continually increasing. Medical societies are rapidly expanding their activities and are anxious to learn of existing experiences.

Health Councils.—Since the Council on Medical Service first reported to the House of Delegates on health councils in July 1946, the subject has become of widespread interest. This interest has been furthered through the News Letter, regional conferences, a special brochure and correspondence.

Health Councils seem to be an excellent medium through which community leadership in health problems may be attained. However, the term health council is used in a variety of ways. It means different things to different persons, and final determination of the use of the term will require further consideration of the entire program.

At present there are three types of general health councils: state health councils, metropolitan health councils and rural health councils. The primary purpose of all three types is planning and coordination. The three types are organized in a variety of ways and for a number of different purposes. Best known of the state health councils are those made up of professional groups (medical, dental and pharmaceutical); those composed of voluntary health agency representatives and those set up by official action of the state government. Examples of the first are the health councils in Illinois and California; of the second, the health councils in Virginia and Vermont; and of the third, the health council in Indiana.

The metropolitan health councils are those found in cities, usually 50,000 or more in population. These are generally composed of representatives of voluntary health agencies and of the professional societies. Many of them are sponsored and financed by the Community Chest.

The community or rural health councils are probably the latest type to develop. Here the efforts of the Council on Medical Service are being coordinated with those of the Association's Committee on Rural Medical Service.

The term health council is used, in addition, to designate more limited groups such as school health councils and even public health units or departments. The functions of such councils in any area must necessarily be integrated with those of the general health council. There is also a national organization known as the National Health Council, which has recently sponsored a conference to promote local health departments.

The Council's efforts in this field are primarily devoted to determining the facts, reporting and interpreting these facts to the members of the medical profession, and arousing an interest on the part of medical societies in taking more active part in the work of the health councils.

Regional Conferences

The Regional Conferences continue to perform a much needed function—the exchange of ideas between the constituent and component medical societies and the American Medical Association. Originally, participation in the conference was limited to the state society committees on medical service, public relations and legislation. Last year invitations were sent to other state society committees, and more recently, at the Northwest Regional Conference and the Rocky Mountain Regional Conferences, all members of the participating state societies were invited to attend and join in the discussions. Another development during 1947 was the joint sponsorship of the Regional Conferences by the Council on Medical Service, the Council on Industrial Health and the Committee on Rural Medical Service The purpose of this move is twofold: first, to provide a better picture of the work of the Association and second, to widen the scope of subjects discussed. Two regions have now organized permanent conference committees. These are the Middle Atlantic States and the Southeastern States.

News Letter

The House of Delegates at the June 1947 Annual Session recommended that the Board of Trustees investigate the possibility of extending the News Letter mailing list to include all Fellows of the American Medical Association, and if this is impossible that at least it be sent to all officers of component county societies. It has not been possible to include all Fellows of the Association. However, the county medical societies are now receiving the News Letter and several state medical associations have offered to mail copies of the News Letter to their membership, provided the Council could supply a sufficient number of copies. At present approximately 13,000 persons receive it monthly.

The News Letter continues to elicit favorable comments from all sections of the country. So many interesting activities of medical societies have warranted reporting that last fall the News Letter was increased to eight printed pages. However, recent printing difficulties have necessitated a return to mimeographing. Temporarily two mimeographed Letters are issued monthly in place of the larger printed Letter.

Special Projects

Fund-Raising Groups.—Physicians throughout the nation are feeling the pressure of the increasing demand made on them by the numerous so-called voluntary health organizations. For many years physicians have cooperated with the programs devised by the National Tuberculosis Association, the American Red Cross and the National Society for Crippled Children and Adults. Little effort was made to devise a program that would be fair to the physician as well as the public. More recently the profession has been called on by the American Cancer Society to make its cancer detection program effective. Here, however, the Board of Trustees and the Council on Medical Service entered the picture and worked for a realistic policy which included the county medical society and the physician. As a result, the American Cancer Society's program has produced many local experiments, with the full approval of the county medical societies concerned and designed to fit local opinion and needs. Presently, if the trend continues, the physician will be confronted with even greater demands. Programs are in process by the American Heart Association, the American Diabetes Association and others.

In view of this trend, the Council proposes to determine the success that country medical societies have had in serving and coordinating the various programs. Only in this manner will it be possible to set forth policies to be used as guide posts for other county medical society relations with the voluntary health organizations.

Assistance at the national level would aid materially in protecting the individual physician against undue demands on the part of the voluntary health agencies. The Board of Trustees has recognized this in several instances. However, the Council recommends to the House of Delegates that further effort be made to obtain direct representation of the Association on all national voluntary health organizations. The Council further believes it would be helpful to sponsor a coordinating committee, composed of representatives of all such national groups, for the purpose of developing policies applicable at the county medical society level.

U.M.W. Health and Hospital Fund

The Council on Medical Service and the Council on Industrial Health have reported at other sessions on the status of the United Mine Workers Health and Hospital Fund or program. The survey made by Admiral Boone gave hopes that something might be accomplished along the lines suggested by the Council in its report to the House of Delegates in June 1947. However, Mr. Lewis has confused the issue somewhat by ignoring the autonomy of this program and for all practical purposes joining it to the Welfare and Retirement Fund program. As a result, the possibility of local plans developed through joint cooperation and financed by both the miners and operators seems eliminated, and in their stead is a national program financed by a national fund derived from the 10 cent per ton impost on coal.

The Fund, however, has an able administrator in Dr. R. R. Sayers. The Council has suggested to him that trial plans be developed in several areas by competent teams composed of able men in various fields such as prepayment, preventive medicine, hospitalization, sanitation, housing and health education, the purpose being to arrive at a policy under which local needs may be determined and met without complete recourse to a national fund or plan. The needs, ability to finance and even the ability to absorb or utilize a health program differ in the various mine areas. This was the basis of the Council's original recommendations and should be the basis for further progress in any union health plan.

An important recent development in the field of labor welfare funds is the decision of the joint House-Senate Committee on Labor Management Relations to investigate the status of such funds under the Taft-Hartley Act. This law states that the detailed basis on which payments are made from such funds shall be specified in a written agreement and provides for equal employer-employee representation in the administration of labor welfare funds.

Group Practice

Interest in group practice has increased during the past two years, particularly among the returning servicemen. The Council has followed the discussion of group practice in the various medical journals.

In June 1947 the House of Delegates approved a resolution referring the study of the question of group practice to the Board of Trustees and suggesting that the Bureau of Medical Economic Research, the Judicial Council, the Council on Medical Service and the Bureau of Legal Medicine and Legislation cooperate in the project. The Board of Trustees, in turn, referred the matter to the Council on Medical Service and requested the appointment of a subcommittee on Group Practice. Following these actions the Council requested a conference of headquarters personnel representing the aforementioned Councils and Bureaus. At that time details of the study were given to the Bureau of Medical Economic Research. The Council on Medical Service selected Drs. Donald C. Balfour, Jesse D. Hamer and Edwin J. Grace to serve on this subcommittee; others may be added in the future.

It is important to note that when the Trustees referred the question of a study on group practice to the council, the proposed subcommittee and the Judicial Council were directed to draw up standards. As the problem of standards was not considered in the original resolution of the House of Delegates, the Council has discussed at length the possibility of setting standards for group practice and has requested the subcommittee to keep the problem of standards in mind during the study. Further reports on this subject will be made during or on completion of the study.

Compulsory Sickness Insurance

Public interest in compulsory sickness insurance continues unabated. Requests for information continue to pour in from physicians, students and others preparing speeches and articles or just interested in the subject. During 1947 and the first three months of 1948 over 12,000 pamphlets and reprints were mailed out in answer to such requests.

The Council wishes to call the attention of the House of Delegates to a serious situation, the complete absence in libraries—school, college and public—of reference material presenting arguments against compulsory sickness insurance. Correspondence reveals many, many persons willing to oppose government control of medical care but handicapped by lack of sources to which they may turn for arguments. The Council has approached the problem in four ways: first, by maintaining a supply of various reprints and pamphlets for distribution to students and others; second, by preparing reference material in bound volume form suitable for library use; third, by making available " loan kits" on the subject for use in cases where detailed reference data are needed and fourth, by preparing and making available a bibliography on sickness insurance publications. Literally thousands of articles, pamphlets and speeches are written annually in opposition to government medicine. Most of them are a repetition of nebulous arguments, many of which are thoroughly sound and extremely important but no longer sufficient to satisfy students, speakers or writers. Basic facts, figures and specific informa- are too often missing. In an effort to remedy this the Council staff is reviewing all literature on the subject with the view to preparing a question and answer booklet suitable to all but the research student. This should be placed in every college, medical school and hospital library. Supplying public and high school libraries is too expensive a job for the present.

Cash Sickness Benefits

The House of Delegates approved the principle of cash sickness benefits in 1938. Since that time interest in the subject, particularly on the part of state legislatures, has developed rapidly. Fifty proposals for cash sickness and related benefits were introduced in state legislatures in 1947. Of this number, twenty-five provided for specific cash sickness benefits to be paid out of a monopolistic state fund, with affiliation compulsory. The implications of this type of program warrant serious consideration. The House of Delegates recognized this when it approved a resolution requesting " a complete study of the existing and proposed compulsory temporary disability compensation programs." The resolution was referred to the Council on Medical Service, and since then the staff has followed closely the developments in various states. These developments were reported to the House in June 1947 and in January 1948.

The Council has postponed a detailed study until experience from more than one type of program can be obtained and compared. The Rhode Island (monopolistic) plan has been in operation over five years, the California (optional) plan over one year and the Railroad Retirement Board (national) plan almost a year. Studies of these three, together with a number of the proposed plans, should provide a reasonable appraisal of the subject. A study of the Rhode Island plan has recently been completed by Miss Elizabeth Wilson and arrangements have been made to have access to the results of the study. Studies of the two other plans will be undertaken in cooperation with the Bureau of Medical Economic Research, unless the Council discovers existing studies comparable to that of Miss Wilson.

The Council is primarily interested in the medical aspects of cash sickness benefit programs and will make every effort to arrive at definite recommendations.

Prepayment Development of 1947

Topping the early predictions of the Council, enrolment figures for the medical society and Blue Cross-sponsored medical care plans give evidence of totaling 7,500,000 as of Dec. 31, 1947. Enrolment as of Dec. 31, 1946 totaled 5,000,000 and on Dec. 31, 1945 it was 2,840,000. The picture today shows more than 7,500,000 persons covered, over 50 per cent enrolment growth in 1947, over 95 voluntary plans in operation in forty-two states and the remaining six states and the District of Columbia in the organization stage. Another and even better picture is presented by over-all voluntary health insurance developments. A recent survey reveals the extent to which the American public is at present insured against hazards such as loss of income due to disability and enjoys the benefits of hospitalization, and surgical and medical care insurance. The following summary shows the number of insurance agreements in effect for the various types of benefits: approximately 30,000,000 persons (one half of the working population)—loss of income due to disability; over 40,000,000 —hospitalization; approximately 17,000,000—surgical benefits, and over 6,000,000—medical benefits.

Plan Descriptions and Statistics.—The individual prepayment plans are making constant changes in benefits, costs and so forth. Changes are necessary in order to meet changing needs.

The Council staff is in the process of compiling all the latest changes as well as preparing descriptions of the new plans developed since the 1947 revision of the " Voluntary Prepayment Medical Care Plans" brochure. In addition, the Council is revising the statistical charts and graphs which were used as a supplement to the prepayment brochure. These revised charts and graphs will make the Council's prepayment exhibit more current.

Cooperation with Other Agencies.—In an effort to avoid unnecessary duplication of work, the Council staff makes every effort to cooperate with other agencies. The data assembled by Associated Medical Care Plans and the Blue Cross Commission are limited to that of plans claiming nonprofit status. As the American Medical Association recognizes all voluntary programs, certain basic research is necessary in addition to cooperation with other groups.

Seal of Acceptance.—The Seal of Acceptance of the Council on Medical Service has been granted to sixty of the ninety-nine plans now in operation. These plans represent a wide variety of types, sizes and experiments in the voluntary field of prepayment medical care. The Standards of Acceptance developed by the Council on Medical Service to be used as a guide in evaluating prepayment medical care plans were designated as preliminary standards. Insurance company representatives, through the Health Insurance Council, have suggested certain amendments to the preliminary standards. These proposed changes are being considered by the Council.

Free Choice of Physician.—The Report of the Judicial Council at the Annual Session of the House of Delegates in 1947 included pertinent remarks in regard to the free choice of physician. While the remarks referred to medical care in general, they were particularly applicable to prepayment plans. The Council on Medical Service studied the Judicial Council's statement and prepared a written discussion of the remarks. The entire application of the principle of free choice of physician and hospital as it applies to prepayment plans is not yet entirely clear to the Council. The extent to which "free choice of physician" may possibly be limited in the various plans has been reviewed and will be discussed further with the Judicial Council.

Another matter submitted to the Judicial Council for consideration was the approval of plans by medical societies. The Standards of Acceptance provide for approval by either a state medical association or county medical society. In considering several local plans, the question arose as to whether they must have state as well as county society approval. It was the Judicial Council's opinion that wherever local prepayment plans operate within a state, these local plans may be accepted by the Council on Medical Service provided they have the approval of the county medical society or societies in whose area they operate and provided they are not disapproved by the state medical society. In other words, these local plans need not necessarily have the approval of the state society, but they must not be disapproved. The Standards will be amended to clarify this matter.

Health Insurance Council.—The insurance organizations which originally participated in the Joint Conference Committee on Health Insurance have renamed the group the "Health Insurance Council." At the outset, the insurance groups were to meet with representatives of the American Medical Association to discuss the application of insurance principles to the economics of medical care. In addition it was desired to bring together all voluntary agencies interested in the extension of prepayment insurance to a greater portion of the American people. The opening sentence of the purposes of the Health Insurance Council states: "The programs providing health insurance coverages, including medical, hospital and surgical expense benefits, are recognized as being in the public interest."

The Council's purposes provide further:

> To the end that such voluntary coverages may better serve the needs of the insuring public, the Health Insurance Council is available to such groups:
>
> 1. For conference regarding their sponsorship or endorsement of voluntary plans for insuring medical, hospital or surgical expenses to be underwritten by private insurers.
>
> 2. For the consideration of means for improvement in the effectiveness of such voluntary plans.
>
> 3. As a source of factual information concerning the extent and nature of health insurance coverages.

On Feb. 10, 1948 representatives of the Health Insurance Council met with a committee of the Council on Medical Service in furtherance of its aims.

Insurance Claim Blanks Simplified.—Since the Council approved two simplified insurance claim forms, three other simplified forms have been prepared as the result of combined efforts of insurance representatives and physicians. While no specific approval has been requested for the newer forms, this shows that both groups are active in eliminating nonessential questions when requesting medical information to be used in appraising insurance claims.

Medical Cooperatives.—The Council's study of consumer-managed voluntary health service plans is nearing completion. To date one hundred and sixty-nine such plans have been found in forty-two states and the District of Columbia. All these plans are not cooperatives, but they are all consumer managed. Sixty-two of the one hundred and sixty-nine plans have reported a total enrolment of 1,028,853 persons.

Special Prepayment Exhibit.—The success of the prepayment part of the Council's exhibit at the Annual Session in Atlantic City, N.J., prompted the preparation of a portable display for use during meetings of state medical associations. The exhibit consists of a large map showing the spread of prepayment plans and six charts and graphs picturing plan growth, enrolment, claim experience and administrative costs.

The Washington Office

It is gratifying to report that none of the health legislation introduced into the Eightieth Congress which in the opinion of the American Medical Association challenged the best interests of the people was enacted.

Every opportunity afforded the Association by Committees and Committee members to testify at public hearings, sit in conferences and discuss individual merits of legislation to propose additions or modifications of the public health laws was accepted. The cordiality with which the contributions of representatives of the Association were received was most gratifying. Although Congress will not adjourn for another couple of months it is not likely that either of the two national health bills will be passed. The Senate Committee is still taking testimony from witnesses, and the reference committee in the House of Representatives has not started its hearings.

S. 140 (Taft), which proposes to create a Department of Health, Education and Security with cabinet rank, was reported out by the Senate Committee on Labor and Public Welfare, but repeated attempts to have it advanced to the floor have failed through objections offered by senators. The present draft of the bill provides that it shall be administered by a Secretary of Health, Education and Security, appointed by the President, who shall have three undersecretaries, each appointed by the President--one for health, one for education and one for security. Nothing in the bill requires that the Undersecretary of Health shall be a doctor of medicine. Provision is made for a Bureau of Health which shall be administered by the Undersecretary of Health who shall have charge of the health functions and activities of the department. The Secretary is authorized to appoint advisory committees, whose members shall be qualified persons not otherwise employed by the federal government. To the Bureau of Health shall be transferred the U. S. Public Health Service, the Food and Drug Administration, Freedmen's Hospital and Saint Elizabeths Hospital.

S. 1290 (Saltonstall) and H. R. 1980 (Howell) in their original form were alike in providing for assisting the states both with subsidy and personnel for the medical examination of school children. At the hearing on the Senate bill, an elaborate amendment was offered which would extend the service to all children and youth of school age. Provision was also made for instruction in physical education. The Association's witness took exception to the provision that treatment should be made available without regard to the ability of parents to provide it. Objection was also raised to the fact that no provision is made for consultation between the school physician and the family and the family physician. The witness for the Association recommended that the states be encouraged to carry on the work without federal interference and that opportunity be provided for appeal to the courts when differences arise between the state administrative body and the Federal Security Administrator.

S. 1679 (Murray) and H. R. 4303 (Dingell) provide for a national program of retirement, survivors and extended disability insurance similar to sections of S. 1050 (Seventy-Ninth Congress).

S. 2189 (Saltonstall) and H. R. 5644 (Dolliver) and H. R. 5678 (Priest)-the local Public Health Services Act of 1948-provide for grants-in-aid to assist the states in the development and maintenance of local public health units. The aid is to be administered through the Surgeon General acting with the approval of the Administrator of the Federal Security Agency. The states are to submit their plans, and in order to receive the Surgeon General's approval the plans must (1) cover all areas of the state; (2) guarantee adequate authority to the state and public health officials; (3) guarantee continued financial support and employment of full time personnel; (4) guarantee adequate distribution and effective use in the extension and expansion of basic public health services; (5) establish and maintain personnel standards on a merit basis, and (6) make such reports as the Surgeon General may require. In general, the federal government will contribute one third of the appropriation required. The Surgeon General, after reasonable notice and opportunity for hearing, may refuse to make further appropriations if he finds that the state fails to comply substantially with any of the provisions already stated. No provision is made for the state to appeal to the courts in defense of its plan, as is provided in the Hospital Construction Act.

S. 2215 (Bridges) provides for research and control relating to diseases of the heart and circulation by aiding in the conduct of researches, investigations, experiments and demonstrations relating to the cause, prevention and methods of diagnosis and treatment of diseases of the heart and circulation. It would establish in the Public Health Service a National Heart Institute, to be administered by the Surgeon General. It would make grants-in-aid to universities, hospitals, laboratories and other public or private agencies, as well as to individuals. It would establish an information center on research. Volunteer patients with heart disease would be admitted to the institute for study and treatment. It provides for the creation of a National Heart Council to consist of the Surgeon General of the Public Health Service, the Chief Medical Officer of the Veterans Administration, the Surgeons General of the Army and Navy and twelve members who shall be leaders in the fields of fundamental sciences, medical sciences, education or public affairs.

Two somewhat similar bills, H. R. 5087 (Keefe) and H. R. 5159 (Smathers), are in the House of Representatives.

Appropriations.—The House of Representatives on March 8 passed an overall total of $173,230,500 appropriation for Public Health Service programs and activities for the fiscal year 1949, which represents $43,673,575 more than corresponding appropriations for 1948.

1. Venereal Disease gets $17,230,000. Most of this money will be distributed among the states through grants-in-aid on a fifty-fifty basis. The amount is slightly less than that allowed for 1948

2. Tuberculosis has been allowed $9,291,000, which represents an increase of $945,348 over 1948. The increase is allowed for the equipment and operation of eighteen new mass x-ray units for case finding and the conduct of large scale pilot studies of BCG vaccine.

3. Assistance to States, general, totals $13,865,000, which represents an increase of $378,000 over 1948 for comparable activities. Two activities included in the budget estimate were excluded for the time, namely, $4,000,000 for mental hygiene and $1,500,000 to conduct demonstrations in schools on the application of sodium fluoride to the teeth of school children.

4. Communicable Diseases was allowed $7,490,000, which is $429,176 less than the comparable 1948 appropriation. The decrease is accounted for by the assumption on the part of the states of a larger proportion of the cost of malaria and typhus control operations.

5. Hospital Construction had $60,000,000 appropriated for expenditures during the year, and $75,000,000 is allowed for contract authorization. In the deficiency appropriation bill which was passed earlier in the year, an item of $15,000,000 was carried to meet cash requirements for actual construction estimated to be completed by the end of the year. Thus, of the $375,000,000 authorized by the Hospital Construction Act, $150,000,000 will be spent or available for 1949. The government appropriates one third of the actual cost of construction.

6. Administration Expenses and Hospital Construction were allocated $1,352,000, an increase of $424,015 over the corresponding 1948 appropriation for administrative and technical personnel. Forty-six additional positions, largely in the technical categories of architectural engineering and hospital administration, are to be added.

7. Hospitals and Medical Care had $21,443,000 appropriated, a net increase of $71,891 over 1948. The beneficiaries are twenty-one general marine hospitals, two tuberculosis marine hospitals, one leprosarium, seventeen full time outpatient clinics, ninety-eight part time outpatient offices and in addition medical, dental and nursing personnel for coast guard installations and cutters. For foreign quarantine service $3,000,000 is appropriated, representing an increase of $298,141 above the comparable 1948 appropriation.

Employee Health Services Programs received an appropriation of $392,500, which funds are to enable the public health service to supervise the emergency treatment and preventive health programs operated for government employees by the various agencies of the government.

The National Health Institute is allowed $13,570,000, which represents an increase of $2,567,125 over 1948. Of the total budget increase, $1,382,500 is for additional research in diseases of the heart and circulatory system; $7,682,000 is allowed for grants in aid of research, and $400,000 is earmarked for research fellowship grants. A separate item of $100,000 is appropriated for research on peptic ulcer.

The National Cancer Institute is allowed $14,000,000, which is the identical amount available for the current fiscal year.

Salaries and Expenses were allocated a total of $4,047,700, a decrease of $11,738 from the comparable 1948 appropriation.

The Office of International Health Relations is granted $285,000, which is $67,920 below 1948.

President's Communications.—During the life of the Eightieth Congress, the President has submitted to it five health messages recommending the establishment of a national sickness insurance program. It is rumored that he is preparing another. He has also written a letter to the Federal Security Administrator directing him to prepare a ten year health program. The Administrator is preparing to comply with this request and has invited a group of public spirited persons (the original group included only one physician) to assist him in conducting a National Health Assembly May 1-4, 1948. A similar conference was held in 1938.

Health Activities of Washington Groups.—One hundred and twenty-five national organizations are sponsoring a National Conference on Family Life to be held in Washington, D.C., May 6-8, 1948. Deliberations will be grouped in the following manner: premarital and early years of marriage; the family with small children; the family with adolescents, and the aging family.

There are other groups in the capital which are functioning with some phase of health as one of their considerations: (1) the National Security Resources Board (not related to any other agency) is organizing a medical division to study the resources of the country. Dr. Paul R. Hawley is advising in the development of the division; (2) the Research and Development Board is organized to study the medical research within the defense forces. It serves as a coordinating body of the armed services and is organizing a medical science committee, which it is hoped will be functioning before summer; (3) the Civil Aeronautics Administration has a medical division which formulates standards for physical examination of applicants for filing licenses.

The Brookings Institution has recently completed a study of health conditions for the Senate Committee on Labor and Public Welfare. A copy of the conclusions and recommendations was distributed with a recent bulletin from the Washington office. The Institution is also collaborating with the Hoover Committee, which is planning a reorganization of the Executive Department of the national government. It is collecting data on health activities.

The Atomic Energy Commission has an active health section.

The Citizens' Advisory Council is an organization set up by the Senate Committee on Finance. The Chairman is Edward R. Stettinius, former Secretary of State. Its function is to study the social security program and make recommendations for its improvement.

Office Activities.—During the year, the Washington office prepared and distributed eighteen regular bulletins and fourteen special bulletins to a mailing list that now surpasses 2,000. The list contains the names of members of the Council on Medical Service, the Board of Trustees and the House of Delegates and names submitted during the year by officers of state medical associations. A few have been added by personal request or at the suggestion of another subscriber. Recently a "multilith" was installed and has proved to be of great convenience in the preparation of the bulletins; they are much improved in appearance and are mailed more promptly. The bulletins are issued with no attempt at regularity, but average about one every ten days. Requests for assistance and advice, both from members of Congress and from government agencies, are increasing materially as are requests from physicians and organizations throughout the country for information not only on legislative matters but on a variety of other aspects of medical legislation and public health.

Respectfully submitted,

JAMES R. McVAY, Chairman.
A. W. ADSON, Vice Chairman.
THOMAS A. McGOLDRICK.
E. J. McCORMICK.
WALTER B. MARTIN.
ELMER HESS.
JESSE D. HAMER.
EDWARD L. BORTZ.
H. H. SHOULDERS.
GEORGE F. LULL.
JOSEPH S. LAWRENCE,
Director, Washington Office.
MR. THOMAS A. HENDRICKS.
Secretary.

RESOLUTIONS SUBMITTED BY CONSTITUENT ASSOCIATIONS

The following resolutions for submission to the House have been sent in by the Executive Secretary of the Missouri State Medical Association:

Resolution on Practice of Medicine for Profit

WHEREAS, There is an ever increasing tendency on the part of hospitals and medical schools throughout the United States to engage in the practice of medicine for profit; and

WHEREAS, This corporate practice of medicine is a professional evil second only in its consequences to socialized medicine; and

WHEREAS, Such practice constitutes not only exploitation of the medical profession but perhaps also of the patient; therefore be it

Resolved, That the House of Delegates of the Missouri State Medical Association in convention assembled condemn the practice of medicine for profit by either hospital or medical school; and be it further

Resolved, That our Delegates to the American Medical Association be instructed to present this information to the House of Delegates of the American Medical Association; and be it further

Resolved, That the American Medical Association remove every hospital engaged in the practice of medicine from its list of hospitals approved for internship and residency training; and be it further

Resolved, That the American Medical Association remove any offending medical school from its list of institutions approved for medical teaching.

Resolution on Nonprofit Prepayment Medical Care Plans

WHEREAS, The American Medical Association on many occasions has encouraged the formation of nonprofit voluntary prepayment hospitalization and medical service plans by its constituent state and county societies; and

WHEREAS, These constituent state and county societies have participated in the formation and development of nonprofit voluntary hospitalization programs (nationally known as Blue Cross hospitalization plans) and nonprofit medical surgical service programs (nationally known as Blue Shield plans); and

WHEREAS, The action of the American Medical Association in canceling its contract with the Chicago Blue Cross and Blue Shield plans which provided hospitalization and medical surgical coverage for the employees of the American Medical Association and in contracting with a commercial insurance company for the same coverage was not in the best interest of the medical profession as a whole or the voluntary Blue Cross and Blue Shield plans; and

WHEREAS, This action of the American Medical Association has already by adverse publicity caused serious embarrassment to the Blue Cross and Blue Shield plans; therefore be it

Resolved, That the House of Delegates of the American Medical Association instruct its Board of Trustees to immediately cancel the contract with the commercial insurance company and reinstate the contract with the Blue Cross and Blue Shield plans.

Digitalis.—The foregoing observations, we believe, lend support to the position that the sequence employed in the most common practice of trying digitalis first and then adding a diuretic, if necessary, is in need of revision. In the concept of treatment, the indications are that the order should be reversed; an effective technic for dehydration with salt restriction, free supply of water and a potent diuretic become the base of the system; digitalization becomes an auxiliary or accessory measure, without value in many but of some use in others, and essential in a certain group, especially those with auricular fibrillation. From the standpoint of results, this seems to be a more fruitful approach; there is indication that the incidence of improvement in congestive failure may be much higher from an effective system of dehydration alone than from digitalis alone.—Gold, H., and others: *American Journal of Medicine,* December 1947.

ORGANIZATION SECTION

Council on Medical Service

Rocky Mountain Regional Conference on Medical Service, Denver
May 19-20, 1948

The Rocky Mountain Regional Conference is open to physicians from a six state area--Colorado, Kansas, Nebraska, New Mexico, Utah and Wyoming. The conference will be under the direction of James R. McVay, Chairman of the Council on Medical Service. John S. Bouslog, M.D., of Denver, president of the Colorado State Medical Society, will open the conference with an address of welcome.

Cooperating with the Council on Medical Service are the Council on Industrial Health and the Committee on Rural Medical Service. The two day program will include a general session on medical organizational problems and sessions of rural health, industrial health problems, prepayment medical care plans and rehabilitation.

Key speakers for the conference are: Dr. A.C. Sudan, of Denver, the Association's General Practice Medalist for 1947, speaking on "The General Practitioner"; Mr. Jack Foster, editor of the *Rocky Mountain News* (Denver), "The Modern Newspaper Looks at the Modern Doctor," and Dr. Harold C. Lueth, dean of the University of Nebraska School of Medicine, "Medicine in the next Emergency."

The Rural Health session will feature a panel discussion on the past and future of state rural health programs, with special emphasis on the responsibility of local communities in the planning and development of such programs. Dr. Fred A. Humphrey of Fort Collins, Colo., member of the Committee on Rural Medical Service of the American Medical Association, will preside.

Industrial health problems in the Rocky Mountain area will be highlighted at the morning session, May 20. Dr. George H. Phelps of Cheyenne, Wyo., will preside. The six presentations by outstanding speakers will underscore the principal directions in which organized community effort is necessary if the objectives of industrial health are to be realized. It will also be pointed out that the highest type of medical leadership and diplomacy is needed to assure that the essential interests of the worker, employer and physician are properly understood and safeguarded.

A rehabilitation round table is scheduled for the second afternoon and will be moderated by Dr. Atha Thomas of Denver. Community needs and facilities for rehabilitation of the physically handicapped will be reviewed. Physicians, industrialists and community leaders are expected to be in attendance. A demonstration of new devices and proper fitting of artificial limbs will be featured by Dr. Thomas and Mr. Chester Haddan, also of Denver.

Dr. A.J. Offerman, president of Nebraska Medical service, will open the discussion of prepayment medical care plans, to be participated in by representatives of plans in the six states.

Washington Letter

(From a Special Correspondent)

May 5, 1948.

Opposes Induction of Officers Over Draft Age

The American Medical Association asked Congress, in testimony presented to the House Armed Services Committee by Dr. James C. Sargent, to prevent a disproportionate number of physicians being inducted in the armed forces in the event of war. The legislators were requested not to act on provisions in the draft bill calling for induction of physicians beyond the 19 through 25 draft age group. Under the measure, doctors, dentists and veterinaries would be eligible for a two year draft through age 44.

National Health Assembly

Dr. Edward L. Bortz, President of the American Medical Association, was on the panel of speakers at the four day National Health Assembly which convened in the Capital. Others were Dr. Morris Fishbein, Editor of THE JOURNAL; Dr. E. Brock Chisholm, executive secretary of the Interim Commission for the World Health Organization; Dr. V. A. Getting, president of the Association of State and Territorial Health Officers, and Dr. Leonard A. Scheele, Surgeon General, U. S. Public Health Service. Federal Security Administrator Oscar R. Ewing, who called the assembly to obtain suggestions for the ten year national health program proposed by President Truman, said he hoped the conference would result in more intensive community attacks on health problems and that it would create greater harmony between diverse medical groups.

Cancer Institute Opens Study of Occupational Cancer

Dr. W. C. Hueper of New York, cancer pathologist, will direct the occupational cancer laboratory at Georgetown University Medical School, which is part of a new program of the National Cancer Institute. A new section will conduct research on occupational cancer hazards and try to determine what they are and how they can be prevented.

St. Elizabeths Hospital Lauded in Report

The mental hygiene division of the Federal Security Agency reports that St. Elizabeths (mental) Hospital in the nation's capital is not only the least crowded institution of its kind in the country but spends nearly twice as much time as any state mental hospital for the care of its patients. The report also stated that the hospital has 2.6 patients per employee while in many state institutions there are as many as 9 patients for each worker. Expense per patient is reported at $1,058 annually compared with a per capita expense of $2,300 in most Southern states. In addition, while overcrowding has increased elsewhere, St. Elizabeths is said to be the only one of eight hospitals with room for more patients. Recently a House subcommittee reported to the full Education and Labor Committee an amended bill to authorize

St. Elizabeths to admit and treat patients on voluntary applications, a plan long sought by Dr. Winfred Overholser, the superintendent.

Admission of Displaced Doctors, Dentists and Medical Nurses Sought

A House Judiciary Committee broke a long deadlock and sent to the House for action the bill to permit 200,000 displaced Europeans to come to the United States. Included would be doctors, dentists, nurses and persons with scientific, educational and technologic qualifications. The bill would permit entry of this number of persons over two years and charge them to future immigration quotas of their native countries. President Truman had advocated admitting 400,000 in four years.

Booklet for Veterans Who Have Tuberculosis

The Veterans Administration is sending a booklet to the 13,369 tuberculous patients in veterans' hospitals. Dr. John B. Barnwell, chief of the Veterans Tuberculosis Service, said that the disease kills almost 200 patients a month in the agency hospitals, and he claimed that this figure can be cut sharply. Patients must be instructed in proper care and diet, must not become despondent over the long recovery period necessary for a cure, must not be guilty of self neglect and must have their morale raised. To get rid of tuberculosis, he said, means rest, proper care in a hospital, not at home, and proper food.

Medical Legislation

STATE LEGISLATION

Kentucky

Bills Enacted:—S. 135 was approved March 25. It provides for the creation of a board of examiners for the certification of clinical psychologists. S. 199 was approved March 29. It creates a state tuberculosis sanatorium commission to have charge of the government and operation of all of the state tuberculosis sanatoria and to employ and fix the compensation of the medical director of each sanatorium. Such medical director must be a member in good standing of the Kentucky State Medical Association or the National Tuberculosis Society and must have had at least five years' clinical experience in the field of tuberculosis.

Massachusetts

Bill Introduced.—H. 2139 has been introduced as a substitute for a number of pending proposals relating to antivivisection. This proposal would provide for an investigation and study by an unpaid special commission relative to the procurement and treatment of animals for medical experimentation and study.

Bill Enacted.—H. 934 was adopted Feb. 19, 1948. It enacts a resolution to the Congress of the United States memorializing Congress to enact legislation providing for the establishment of a National Science Foundation with the appropriation of sufficient funds to encourage scientific research to be conducted which shall be made available to the directors of the armed forces and insure national security in the future.

Mississippi

Bills Enacted.—H. 818, approved April 9, provides for an appropriation to the Mississippi commission on hospital care for the purpose of building, erecting and equipping hospitals and other facilities within the state of Mississippi. H. 1008, approved April 9, provides for an appropriation to the Mississippi commission on hospital care for the purpose of building, erecting and equipping and contributing to the building, erecting and equipping of hospitals within the state. H. 1047, approved April 9, provides for an appropriation for assistance in carrying out a program of coordinated school, health and nutrition services throughout the state, in cooperation with the international health division of the Rockefeller Foundation and the general education board. S. 229, approved April 10, prohibits the operation of any store alleged to be a drug store or pharmacy unless the owner or operator be, or shall have in his regular employ therein, a registered pharmacist or a licensed physician on duty. S. 450, approved April 10, provides for the appointment of the State Board of Dental Examiners by the Governor from a list to be submitted by the Mississippi Dental Association. S. 453, approved April 14, enacts an enabling act for the organization and operation of nonprofit hospital, medical and surgical service corporations.

New Jersey

Bill Introduced.—A. 467 proposes the creation of a board of chiropractic examiners to regulate and license practitioners of that art. Chiropractic is defined as the theory and practice of nerve impulse control by vertebral adjustment by hand only, for the purpose of removing a cause of disease. The proposal would authorize licentiates to use the Neurocalometer, x-ray and other instruments necessary, solely for the purpose of diagnosis or analysis.

Bill Enacted.—A. 105, which has become chapter 34 of the Laws of 1948, proposes to require persons desiring to practice dental hygiene to first obtain a license permitting such practice from the State Board of Registration and Examination in Dentistry.

Rhode Island

Bill Introduced.—H. 966 proposes certain amendments to the hospital licensing law, among which is the definition of a hospital as "an institution for the lodging, care and treatment of persons suffering from disease or other abnormal physical or mental conditions." The proposal would exempt convalescent homes from its operations and would also provide that no person shall obtain medical or surgical treatment under false representations as to his financial condition from any hospital or outpatient department or dispensary licensed by the hospital licensing law.

Bill Enacted.—H. 572, approved April 27, amends the law relating to professional nursing by adding a few sections to such law which regulate the practice of practical nursing. The term practical nurse is not defined by the law.

South Carolina

Bill Introduced.—H. 1652 proposes, among other things, that the Medical College of South Carolina may participate in federal funds that may be available to assist it in financing the construction and equipment of a teaching hospital.

Bills Enacted.—H. 1222, which has become Governor's Act 1116 of the Acts of 1948, provides for the establishment of eight scholarships at the Medical College of the State of South Carolina of the value of $75 per month plus tuition, conditioned on the recipient doing private general medical practice during one calendar year for each year of the scholarship in some rural community in the state designated by the state board of health. H. 1413, adopted April 10, directs the Board of Naturopathic Examiners of the State of South Carolina to immediately undertake a study of the various licenses and personal qualifications of applicants heretofore licensed to practice naturopathy in the state and the propriety of canceling any licenses erroneously obtained. The Board is further directed to immediately cancel any licenses of licensees to practice naturopathy, if said Board in its discretion decides that said license should be canceled for any reason; and in checking the qualifications of the licensees the Board shall take into consideration the information developed by the Law Enforcement Division of the State of South Carolina and such other information as said Law Enforcement Division may be able to obtain with reference thereto. The board of Naturopathic Examiners is directed to submit to the General Assembly of South Carolina on its opening day in January 1949 a full and complete written report concerning the matter. H. 1803, adopted April 10, establishes, by resolution, a special committee for the purpose of studying and making an investigation into the need and feasibility of establishing an institution, either separately or in connection with any existing state institution, for the purpose of treating chronic alcoholic addicts. S. 722, which has become Governor's Act 1193 of the Acts of 1948, authorizes any department, commission, board or officer of the state to have microfilms made of any part of its records and provides that such microphotographs or microphotostatic copies of such records may be introduced in evidence in any court of law in the state to the same extent as the original records would have been.

GOVERNMENT SERVICES

ARMY

DR. BLAKE APPOINTED CHAIRMAN OF NEW COMMITTEE

Dr. Vannevar Bush, chairman, research and development board of the national military establishment, announces the appointment of Dr. Francis G. Blake, Sterling Professor of Medicine at Yale University, as chairman of the newly formed Committee on Medical Science.

The Committee on Medical Science of the Research and Development Board will be concerned with the survey, analysis and evaluation of all aspects of research and development activities in the field of medical and allied sciences, within the Military Establishment. As far as research and development activities are concerned, the Research and Development Board Committee on Medical Science will work closely with the Hawley Committee, appointed by the Secretary of Defense to review all activity in the military establishment related to medicine and allied sciences. Dr. Blake is well known for his investigations on pneumonia, penicillin therapy and epidemic disease. He is also consultant to the Surgeon General of the Army and of the Army Epidemiological Board, and a member of the National Research Council Committees on Medicine and Chemotherapy. In addition to the chairman, the Research and Development Board Committee on Medical Science will be composed of two civilian members selected from the field of medical science and not more than two members each appointed from the Departments of the Army, Navy and Air Force.

THE JOHN SHAW BILLINGS EXHIBIT

The fifth exhibit in the series "Famous Men of Army Medicine" memorializes Col. John Shaw Billings, under whose leadership for the thirty years ending in 1895 the Army Medical Library grew from a small beginning to more than 300,000 volumes and pamphlets and more than 4,000 portraits of physicians. Dr. Billings also developed the Index Catalogue of the Library of the Surgeon General's Office and planned Johns Hopkins Hospital. He saw four years of active service in camps and hospitals during the Civil War, performing many major operations after the Battles of Chancellorsville and Gettysburg. He is said to have been the first surgeon in the war to successfully excise the ankle joint; this procedure had been done only two or three times previously in the history of surgery. Numerous honorary degrees and memberships were conferred on Dr. Billings, and during World War II an Army General Hospital in Indiana was named in his honor. In commemorating the thirty-fifth anniversary of his death the Specimen Fasciculus, issued by him in Washington, D.C., in 1876 as the prospectus of the great Index-Catalogue, was on exhibit in the Library of Congress March 6-12.

COURSE IN NUCLEAR PHYSICS

The total attendance at the five day course on the medical aspects of nuclear energy given at the Army research and graduate school, Washington, D. C., was five hundred and thirty-eight as of February 6, including twenty-seven persons from various medical schools throughout the country and four from the Royal Army Medical Corps; others taking the course were from the armed services, Public Health Service, Veterans Administration and the Atomic Energy Commission.

INSTITUTE OF PATHOLOGY

Lieut. Col. Carl F. Tessmer, MC., of the staff of the Institute of Pathology, left February 28 for an extended tour of duty with the National Research Council, Tokyo, Japan.

Col. J. E. Ash, retired, scientific director of the American Registry of Pathology, spoke in March at the Tulane University of Louisiana School of Medicine, New Orleans, on the pathology of rickettsial diseases, and before the New Orleans Parish Medical Society on the reticuloendothelium in infections.

Col. Kenneth F. Ernst, chief of laboratory services, Letterman General Hospital, San Francisco, is now on a three months' research and study project at the Institute of Pathology.

HOW TO REMAIN AT NORMAL WEIGHT

Dr. Louis H. Newburgh, professor of clinical investigation, University of Michigan Medical School, Ann Arbor, in a lecture before Army Medical officers at the Army Medical Center, Washington, D.C., in March concluded that there is only one way to get fat and that is by overeating. It was long supposed, he said, that certain conditions of obesity—Cushing's syndrome—resulted from too little secretion of one of the hormones from the pituitary gland. Dr. Newburgh said that anterior pituitary deficiency does cause a condition which can be mistaken for obesity, especially in women, but there is no notable increase of weight. The abdominal walls are weakened so that the internal organs tend to bulge outward, but there is actually no more fat than before. Another hypothesis which seemed valid for a time was that some states of obesity were due to injuries of the hypothalamus. Animal experiments have not shown any influence of the hypothalamus on the deposition of fat. The hypothalamus in some human beings is affected by encephalitis, and some of these victims become obese. While this has been taken to prove the hypothalamic hypothesis, the facts are, he said, that in the majority there is no change of weight and statistical studies give no validity to the assumption. Dr. Newburgh discussed other theories on the cause of obesity before making the conclusion that overeating is the only way to get fat. He also said that a low caloric diet is more important than exercise as a weight-reducing measure, and that it is necessary to walk 36 miles (58 kilometers) to rid the body of 1 pound (0.5 Kg.) of weight. He warned against giving thyroid and other preparations except in exceptional circumstances; they seldom do any good for a protracted period, and they confirm the patient in his belief that his fatness is due to a cause beyond his control; consequently he eats as much and remains as lazy as before.

NAVY

RESEARCH ON RESPIRATORY DISEASES

With the transfer of the Naval Medical Research Unit 4 from Dublin, Ga., to Great Lakes, Ill., the unit will emphasize research on respiratory diseases, in preparation for any contingency which may arise from reenactment of selective service or from universal military training. The Navy maintains a similar research unit on the West coast for control of respiratory infections, and one in Cairo, Egypt, for the study of tropical diseases. Arrangements are being made for a three man team from the Department of Agriculture to join the research unit at Cairo to collaborate on the control of disease-conveying insects. This is the second time that scientists of the Department of Agriculture have been sent to the unit in Cairo, the first instance being for the control of flies and mosquitoes. This group from the Department of Agriculture became famous in developing effective control of typhus by the control of lice with DDT.

HUMAN ENGINEERING

The Bureau of Medicine and Surgery is preparing an exhibit for the annual convention of the Aero-Medical Association in Toronto, Canada, June 15-18. The exhibit, "Human Engineering," will show the advances in naval aviation medicine in adapting pilots to flight and in designing equipment to increase human tolerance to altitude and acceleration. The problems of supersonic speed of aircraft have been foreseen by the Navy research personnel, and this exhibit will demonstrate the accomplishments and aims of this branch of research.

COURSES OF INSTRUCTION

The following Naval Medical Officers, having completed courses of instruction as indicated, have been assigned to duty: Comdr. John R. Cavanagh, from residency training in psychiatry at the Public Health Service Hospital, Fort Worth, Texas, to duty at Portsmouth, N.H.; Lieut. Alfred B. Mason, from training in tropical medicine at Naval Medical School, Bethesda, Md., to Camp Lejeune, N.C.; Lieut. Moses E. Rice Jr., from residency training in general surgery at the Naval Hospital, Philadelphia, to the Naval Hospital, Key West, Fla.; Lieut (jg) Elbert C. Brinning Jr., U.S.N.R., from basic refresher course, Naval Medical School, Bethesda, Md., to Marine Corps District Headquarters, Recruiting Station, Newark, N.J.; Lieut. (jg) Donald W. Drew, U.S.N.R., from basic refresher course, Naval Medical School, Bethesda, Md., to Naval Base, Long Beach, Calif.

PERSONAL

Capt. Robert L. Ware (M C) will be a delegate to the sixth Decennial Conference for Revising the International List of Causes of Death in Paris, France, April 26-30. The session will be under the auspices of the Interim Commission of the World Health Organization. The conference this year will consider including causes of sickness and injury as well as causes of death.

Lieutenant (jg) Lowell K. Cunningham (MC), of San Diego, Calif., has been appointed to the permanent grade of lieutenant (jg) on completion of an internship at the Naval Hospital, San Diego.

Lieut. Walter H. Jarvis Jr., Grand Saline, Texas, a former officer of the regular Navy, has accepted a commission in the Medical Corps Reserve and has been ordered to duty at the Naval Hospital, Houston, Texas.

Rear Admiral Joel T. Boone was awarded the honorary degree of doctor of laws by Hahnemann Medical College, Philadelphia, March 18, on which occassion he delivered the commencement address. Dr. Boone is a graduate of Hahnemann Medical College.

NAVY OFFICERS APPROVED FOR GRADUATE TRAINING

The Advisory Board of the Bureau of Medicine and Surgery has approved the following officers for graduate training:

Capt. Martin V. Brown, instruction in dermatology and syphilology, Northwestern University, Chicago.
Capt. Gordon H. Ekblad, instruction in dermatology and syphilology, Northwestern University.
Comdr. John L. Flannery, course in pediatrics, University of Pennsylvania Graduate School of Medicine.
Comdr. George J. Kohut, additional training in obstetrics and gynecology, Naval Hospital, Portsmouth, Va.
Comdr. Emmet F. Norwood, residency in surgery, Naval Hospital, St. Albans, N. Y.
Comdr. Roy R. Powell, residency in ophthalmology, Naval Hospital, Oakland, Calif.
Comdr. John D. Walters, course in dermatology and syphilology, University of Pennsylvania Graduate School of Medicine.
Comdr. Karl V. Kaess, instruction in dermatology and syphilology, Northwestern University.
Comdr. William N. New, instruction in dermatology and syphilology, Northwestern University.
Comdr. Arthur L. Schultz, additional training in neurosurgery, Naval Hospital, Long Beach, Calif.
Comdr. William O. Umiker, residency in pathology, Naval Medical School, Bethesda, Md.
Comdr. Harry James Alvis, preventive medicine, Harvard University School of Hygiene and Public Health, Boston.
Comdr. Sylvester F. Williams, fellowship in radiology, University of Chicago.
Lieut. Comdr. William C. Cantrell, children's orthopedics, State University of Iowa.
Lieut. Comdr. Jacob J. Robbins, residency in internal medicine, Naval Hospital, Chelsea, Mass.
Lieut. Comdr. Henry S. Colony, course in neurology, New York Neurological Institute.
Lieut. Comdr. Charles H. Gilliland, residency in obstetrics and gynecology, Naval Hospital, Bethesda, Md.
Lieut. Comdr. Wilson J. Huston, residency in obstetrics and gynecology, Naval Hospital, Bethesda, Md.
Lieut. Comdr. J. D. Langston, fellowship in pathology, Mayo Clinic, Rochester, Minn.
Lieut. Caesar F. Orofino, residency in orthopedic surgery, Naval Hospital, St. Albans, N. Y.
Lieut. Robert E. Switzer, residency in psychiatry, Colorado Psychopathic Hospital, Denver.
Lieut. Frank A. Cerzosimo, course in pediatric and obstetric anesthesia, the Montreal Children's Hospital and the Maternity Pavilion of the Royal Victoria Hospital, Montreal, Canada.
Lieut John W. Reece, aviation medicine, Naval Air Station, Pensacola, Fla.
Lieut. Thomas E. Atkinson Jr., residency in ophthalmology, Naval Hospital, Bethesda, Md.
Lieut. (jg) Carleton J. Brown, residency in pediatrics, Naval Hospital, Chelsea, Mass.
Lieut. (jg) Tom C. Hardy, fellowship in anesthesiology in a civilian institution.
Lieut. (jg) Raleigh M. Hood, residency in surgery, Naval Hospital, San Diego, Calif.
Lieut. (jg) Theodore H. Wilson Jr., residency in surgery, Naval Hospital, Chelsea, Mass.
Lieut. (jg) John G. Esswein, residency in internal medicine, Naval Hospital.
Lieut. (jg) Robert W. Sharp, residency in internal medicine, Naval Hospital, San Diego, Calif.
Lieut. (jg) James C. Marr, residency in children's orthopedics, St. Charles Hospital, Brooklyn.
Lieut. (jg) William Mayer, fellowship in psychiatry, Langley Porter Clinic, San Francisco.

Medical News

(Physicians will confer a favor by sending for this department items of news of general interest: such as relate to society activities, new hospitals, education and public health. Programs should be received at least two weeks before the date of meeting.)

CALIFORNIA

First Q Fever in San Francisco.—Dr. Jacob C. Geiger, director of public health, City and County of San Francisco, on April 20 reported a case of Q fever in a man, a resident of California for three years. Presumably this is the first case reported in San Francisco. The patient was admitted to the San Francisco Hospital, Stanford Medical Service, March 11 and was discharged April 2. He had been in the northern part of California about ten days prior to the onset of his illness.

CONNECTICUT

Alcohol Studies.—The Summer School of Alcohol Studies conducted by the Laboratory of Applied Physiology of Yale University will hold its sixth annual session from July 9 to August 6. The 1948 course provides a special curriculum for physicians and others professionally concerned with the treatment and care of alcoholic persons and will include work at the Yale Plan Clinic in New Haven. The school is under the directorship of E. M. Jellinek, Sc.D. The lecturers, although mainly from the faculty of Yale University, include representatives of other institutions of education, research, treatment or rehabilitation. A prospectus may be obtained from the Executive Secretary, Summer School of Alcohol Studies, Yale University, 52 Hillhouse Avenue, New Haven, Conn.

ILLINOIS

Rabies in Illinois.—The State Department of Public Health reports that rabies is widespread among dogs in northern sections of Illinois. There is also danger of the disease's becoming prevalent among foxes, one infected animal having been found in Whiteside County. This fox had bitten a farm worker and had attacked a herd of dairy cattle on the same farm before it was killed. Last year more than 3,600 persons in Illinois were given the Pasteur treatment for the prevention of the disease. The *Chicago Tribune* of April 22 reported that 5 men had been bitten by a rabid dog in the vicinity of 51st Street and Woodlawn Avenue, Chicago. Orland Township was placed under rabies quarantine April 21; other townships in Cook County were placed under quarantine earlier this year (THE JOURNAL, February 28, p. 634).

Chicago

Personal.—Dr. Italo Frederick Volini has been honored with a membership in the Medical Society of Bologna, Italy, as of February 20.

University Receives Largest Cancer Grant.—The University of Chicago has received a check for $190,000 from the American Cancer Society, Inc., for use in cancer research. This is the largest such grant ever made by the American Cancer Society, Inc., according to *Illinois Cancer News*, April 1948.

Beds Available at Sanitarium.—La Rabida Jackson Park Sanitarium, on the lake front in Jackson Park, is now prepared to admit a number of acutely ill patients suffering from rheumatic fever or rheumatic heart disease. La Rabida is a charitable, nonprofit, nonsectarian institution admitting Illinois patients aged 4 to 12 years, inclusive, regardless of race, color or creed. Physicians who desire admission for their patients should contact the medical director or the director of social service. While the patient is in residence the referring physician is invited to attend grand rounds on Wednesday from 3 to 5 p.m. A complete report of medical progress will be submitted to the referring physician on the discharge of his patient.

IOWA

Dr. Bean Appointed Head of Internal Medicine.—Dr. William B. Bean, associate professor of medicine at the University of Cincinnati College of Medicine, has been appointed to succeed the late Dr. Fred M. Smith, head of the Department of Internal Medicine in the State University of Iowa College of Medicine City, Iowa. Dr. Bean received his medical degree at the University of Virginia, Charlottesville, in 1935. He went to Cincinnati as a senior medical resident at Cincinnati General Hospital in 1938. After two years as assistant visiting physician at Hillman Hospital, Birmingham, Ala., he returned to Cincinnati in 1942 as assistant professor of medicine at the University of Cincinnati College of Medicine, where in 1946 he was appointed associate professor.

KANSAS

Annual Meeting of State Medical Society.—The Kansas State Medical Society will meet in annual session May 10-13 at the Arcadia Theater, Wichita. Out of state speakers include:

A. Carlton Ernstene, Cleveland, Hypertension.
Arild E. Hansen, Galveston, Texas, The Child with Rheumatic Fever.
Waltman Walters, Rochester, Minn., Malignant Lesions of the Stomach.
Edward B. Tuohy, Washington, D.C., Choice of Anesthetic Agents and Procedures.
Baldwin L. Keyes, Philadelphia, Management of Neuroses.
Henry M. Winans, Dallas, Texas, The Physical Examination.
Willis E. Brown, Iowa City, Iowa, Management of Abortion.
Richard K. Gilchrist, Chicago, Prognosis in Carcinoma of Rectum.
Edward H. Rynearson, Rochester, Minn., Hyperparathyroidism and Hypoparathyroidism.

Round Table Luncheons will be held. Technical exhibits and scientific movies will also be shown. The annual banquet will be held on the Roof Garden, Broadview Hotel, at 7 p.m. Wednesday. The Woman's Auxiliary to the state society will meet in conjunction with the state society.

MASSACHUSETTS

Society News.—At the annual meeting of the Norfolk District Medical Society at the Hotel Kenmore, Boston, May 12, at 5:15 p.m. Karl T. Compton, Sc.D. president, Massachusetts Institute of Technology, Cambridge, will speak on "Lessons from the Story of the Atomic Bomb," following the dinner at 7 o'clock.

Dr. Moore Named Mosley Professor of Surgery.—Dr. Francis D. Moore, Brookline, has been appointed surgeon in chief of the Peter Bent Brigham Hospital and Mosely professor of surgery at the Harvard Medical School, Boston, where he is now assistant professor of surgery. He is also assistant surgeon at the Massachusetts General Hospital, consulting surgeon at the Massachusetts Eye and Ear Infirmary and member of the associate staff of Palmer Memorial Hospital. He succeeds the late Dr. Elliott C. Cutler. Dr. Moore is a graduate of Harvard Medical School, 1939. He joined the Harvard medical teaching staff in 1941 and became assistant professor of surgery in 1947.

MICHIGAN

Personal.—Dr. John M. Weller, Ann Arbor, has been awarded the first Alfred Stengel Research Fellowship by the American College of Physicians. He will undertake studies on the ionic patterns of intracellular fluids and their influence on enzymatic reactions.

Dr. Stapleton Made Emeritus Professor.—After forty-five years of association with Wayne University, Dr. William J. Stapleton Jr., former associate dean of the Wayne University College of Medicine, Detroit, has been appointed "Emeritus Professor of jurisprudence, ethics and economics" by the Detroit Board of Education. Dr. Stapleton was a member of the permanent staff of the college from 1914 until he retired in July 1947.

MISSISSIPPI

Annual Meeting of State Medical Association.—The Mississippi State Medical Association will hold its annual meeting May 11-13 at the Robert E. Lee Hotel, Jackson, under the presidency of Dr. Paul G. Gamble, Greenville. The Ewing Fox Howard Oration will be given by Dr. Everett D. Sugarbaker, Jefferson City, Mo., on "Cancer of the Breast" at the Tuesday evening session. The out of state speakers will be:

James G. Hughes, Memphis, Tenn., Care of the Premature Infant.
Dean F. Smiley, American Medical Association, Chicago, Responsibilities of the Private Physician in the School Health Program.
James V. Lowry, U.S. Public Health Service, Bethesda, Md., Mental Hygiene Program at a State and Local Level.
George E. Shambaugh Jr., Chicago, Treatment of the Deaf and Hard of Hearing Patient.
Shelley R. Gaines, New Orleans, Diagnosis of Common Motor Anomalies.
William B. Clark, New Orleans, Management of Common Motor Anomalies.
Winchell McK. Craig, Rochester, Minn., Operation on the Sympathetic Nervous System for Relief of Hypertension.
E.W. Alton Ochsner and Michael E. DeBakey, New Orleans, Bronchogenic Carcinoma.
C. Thorpe Ray, New Orleans, Management of Congestive Heart Failure; the Role of Diuretics.
Edward S. Miller, Atlanta, Ga., Pathogenesis, Diagnosis and Treatment of the Acute Phase of Poliomyelitis.

The annual banquet will be at the Heidelberg Hotel Wednesday at 7:30 p.m. The Woman's Auxiliary of the state medical association will meet May 11-12 at the Robert E. Lee Hotel.

NEW YORK

Emergency Medical Care.—On April 1 the Medical Society of the County of Monroe instituted a twenty-four telephone service to meet the demands of the public for emergency medical care. Physicians are provided from volunteer groups in each of the four sections of the city.

Society Presents Past President's Keys.—The Medical Society of the County of Erie, at a meeting in the Hotel Statler, Buffalo, February 24, presented Past President's Keys to the nineteen living past presidents of the society. Hereafter a Past President's Key will be presented to the retiring president at the annual meeting in December as a token of appreciation of his service to organized medicine in Erie County.

Bequest to University of Rochester.—A sum of about $1,500,000 was bequeathed to the University of Rochester for research in the medical sciences by the will of Ernest L. Woodward, LeRoy. The bequest will be used to strengthen the school's work in training and research in human health and welfare. Last year Mr. and Mrs. Woodward gave the university a $500,000 estate in LeRoy to be used by the school of medicine and dentistry as a model center for research, diagnosis and treatment of cerebral palsy and infantile paralysis (THE JOURNAL, Jan. 25, 1947, p. 256). The center has been in operation since last October.

New York City

Schick Lecture.—The Bela Schick Lecture will be delivered by Michael Heidelberger, Ph.D., professor of biochemistry, Columbia University College of Physicians and Surgeons, in Mount Sinai Hospital May 11 at 8:30 p.m. on "Immunity as Indicated by the Formation of Antibodies."

Dr. Friedman Goes to Cleveland.—Dr. Sigmund L. Friedman, director of Sydenham Hospital, resigned effective March 15 to accept an appointment to a similar post at Mount Sinai Hospital, Cleveland. Dr. Friedman has been director of Sydenham Hospital since February 1947.

Appoint President of Mount Sinai Hospital.—Alfred L. Rose, vice president of Mount Sinai Hospital since 1945, was recently elected president to succeed George B. Bernheim, who retired from the office and was elected president emeritus, the second to be chosen for that office in the hospital's ninety-six year history. Dr. Rose has been president of the Mount Sinai Hospital School of Nursing since 1943.

Society News.—At the conference of the New York Institute of Clinical Oral Pathology, Inc., May 17, 9 p.m., at the New York Academy of Medicine Dr. Joseph L. Goldman will speak on "The Relationship of the Maxillary Antrum to Oral Surgical Problems."—The New York Dermatological Society meeting February 24 was held in honor of Dr. Howard Fox, professor emeritus of New York University College of Medicine since 1938.

Measles Epidemic.—The New York City Health Department reported April 8 that there were 6,840 cases of measles during March and 11,908 cases and 9 deaths for the first three months of 1948. In the present epidemic less than 1 child in every thousand dies of the disease. In contrast, in the 1922 epidemic there were 40,569 cases and 977 deaths, which meant that 24 of every thousand children with the disease died.

Rehabilitation Symposium.—A rehabilitation symposium has been arranged by the Medical Society of the State of New York in cooperation with the New York State Department of Health for the Nassau County Health Department and the Nassau County Medical Society at Cathedral House, Garden City, Long Island, May 25 from 2 to 5 p.m. Dr. Francis J. Carr, New York, will speak on "Rehabilitation of the Poliomyelitis Patient," and Dr. George G. Deaver, New York, on "What Can Be Done for Cerebral Palsy."

Lecture by Sir Henry Dale.—Under a grant from the Samuel H. Kress Foundation, Sir Henry H. Dale, London, past-president of the Royal Society of England, gave the first lecture on "Chemical Transmission of Nervous Effects" April 20 at the New York University College of Medicine. The lecture was under the joint sponsorship of the New York University-Bellevue Medical Center and Postgraduate Medical School, to which the foundation last month made a grant of $162,000 to be utilized in the integration and expansion of postgraduate training programs.

NORTH CAROLINA

Narcotic Violation.—The Bureau of Narcotics, Washington, D. C., reports that Dr. James M. Northington, Charlotte, pleaded guilty to an indictment charging violation of the federal narcotic law in the United States District Court at Shelby, February 27. He was placed on probation for three years and fined $500.

Course in Medical Mycology.—A month's course in medical mycology, under the direction of Norman F. Conant, Ph.D., is to be offered at the Duke University School of Medicine and Duke Hospital, Durham, June 28 to July 30. Emphasis will be on the practical aspects of the laboratory as an aid in establishing a diagnosis of fungous infection. Work with patients, cultures and laboratory animals will serve as a basis for this course. Applications will be considered in the order in which they are received, but an attempt will be made to select students on the basis of previous training and stated need for this work. A fee of $50 will be charged. Direct inquiries to Dr. Norman F. Conant, Duke University School of Medicine, Durham, N.C.

OKLAHOMA

Tumor Clinic Opens.—The St. John's Tumor Clinic, newly organized diagnostic and cancer treatment center at St. John's Hospital, Tulsa, was formally opened March 2. Although primarily designed for the care of indigent cancer patients, the clinic will be open to the general public under certain circumstances. The project is financed by the Oklahoma Division of the American Cancer Society, together with funds appropriated by Congress and administered through the Oklahoma State Department of Public Health. An executive committee of six Tulsa physicians is in charge of direction of the clinic. For the present the clinic will be in operation on Tuesday mornings only. All patients must be referred by a physician, and indigent patients will be cleared through the Tulsa County Medical Clinic. The clinic has been approved by the board of trustees of the Tulsa County Medical Society.

PENNSYLVANIA

Councilor District Meeting.—The Seventh Councilor District meeting and the Graduate Education Institute and banquet will take place May 13 in Williamsport, beginning at 9 a.m. One hour discussions, with question and answer periods on cardiovascular diseases make up the daytime program. At the dinner at 6:30 p.m. presentation of "fifty year" testimonials will be made to Dr. Saylor J. McGhee, Lock Haven, and Dr. William H. Rote, Williamsport.

Philadelphia

Personal.—Dr. Edward L. Bortz, president of the American Medical Association, was awarded the honorary degree of doctor of law March 18 at the commencement of Hahnemann Medical College and Hospital at Philadelphia.

Dr. Macfarlane Honored.—A dinner in honor of Dr. Catharine Macfarlane was given at the Warwick Hotel, April 7, sponsored by the Woman's Medical College of Pennsylvania. The date marked Dr. Macfarlane's fifty years in medicine. Three hundred guests attended. President Louise Pearce, M.D., gave the welcome and Dean Marion Fay, Ph.D., introduced the guests. Dr. Edward L. Bortz, Philadelphia, President of the American Medical Association, and Judge Dorothy Kenyon, New York, the government's representative to the United Nations on the legal status of women, were the guest speakers.

Disaster Committees Appointed.—The recently formed Atomic Energy Medical Steering Committee is setting up a program to protect the public in event of disaster. Societies represented on the committee are the county medical society, Hospital Council, 348th General Hospital Reserve and the American Red Cross. Dr. F. William Sunderman, chairman, Disaster Preparedness Committee, Philadelphia County Medical Society, has appointed six subcommittees: (1) instrumentation, to determine the existence and intensity of radioactive substances; (2) treatment of casualties, including the availability of blood and blood substitutes; (3) psychiatric, to be concerned with strengthening public morale; (4) emergency administration, to give attention to the movement of large masses of the population to safe areas; (5) epidemiology, to consider public health problems, and (6) public relations, to keep the public informed on procedure to follow in an emergency. The subcommittees made a study of each problem assigned and reported to the general committee in April.

Pittsburgh

Mellon Lecture.—Dr. Eugene F. Dubois, professor of physiology and biophysics at Cornell University Medical College, New York, will deliver the thirty-first Mellon Lecture on May 27, on "Why Are Fever Temperatures over 106 F.?" The Mellon Lectures are sustained by the heirs of the late R.B. Mellon and are sponsored by the Society for Biological Research of the University of Pittsburgh School of Medicine.

Annual Meeting of County Society.—The annual meeting of the Allegheny County Medical Society will be held May 25. A symposium in the afternoon will be devoted to the diagnosis and treatment of cancer. Speakers include:

Eugene P. Pendergrass, Philadelphia, Prevention of Cancer of the Breast.
Alexander Brunschwig, New York, Surgical Trends in the Treatment of Cancer.
Roscoe R. Spencer, U.S. Public Health Service, Bethesda, Md., Trends in Cancer Research, with Special Emphasis on the Role of Cellular Survival and Adaptation.

TENNESSEE

Radioisotopes Training Courses.—A series of three one-month training courses conducted by the Oak Ridge Institute of Nuclear Studies will be held at Oak Ridge this summer in the technic of using radioisotopes. The courses will be held June 28 to July 23, August 2 to 27 and August 20 to September 24. Application forms and additional information may be obtained from Dr. Ralph T. Overman, acting head of the institute's Department of Special Training, Box 117, Oak Ridge, Tenn. The courses will not attempt to cover any special field of application in chemistry or biology but will be based on simple chemical experiments selected and designed to give participants a maximum knowledge and ability in carrying on research with radioactive isotopes. Participants in the second of the three courses will be selected by the Atomic Energy Commission. Thirty-two participants will be selected for each course, for which a fee of $25 will be charged. Participants will be expected to pay their own travel and living expenses. Dormitory or hotel accommodations will be provided in Oak Ridge at the usual rates. The Oak Ridge Institute is composed of fourteen member universities of the South and Southeast. It utilizes facilities in the Oak Ridge Area for graduate research and instruction and is carrying on a general research and educational program in the field of atomic energy under a contract with the Atomic Energy Commission.

TEXAS

Plague Infection in Rat Fleas.—The Texas State Board of Health reported December 23 that plague infection had been found in Dawson County in a pool of 141 fleas from 14 pack rats collected October 2-3. Plague was first reported in native rodents in Texas in Cochran County in 1946 and in Dawson County in May 1947. At that time the state department of health, cooperating with the Communicable Disease Center of the U. S. Public Health Service, undertook a study in the affected counties to determine factors influencing spread of the disease. All rodent ectoparasites collected are forwarded to J. Vernal Irons, Sc.D., Director of Laboratories, Texas State Board of Health, Austin, for the identification of pathogenic organisms.

UTAH

Annual Ogden Surgical Meeting.—The third annual meeting of the Ogden Surgical Society will be held May 19-21 at the Hotel Ben Lomond in Ogden. The program includes the following guest speakers: James H. Bloomfield and Lester R. Dragstedt, Chicago; Louis A. Buie and Ralph K. Ghormley, Rochester, Minn.; Charles S. Cameron, New York; I. Mims Gage, New Orleans; George Crile Jr., Cleveland; Emile F. Holman, San Francisco; Howard P. Lewis, Portland, Ore., and Robert A. Moore, St. Louis. The meeting is open to all physicians who are members of their respective county societies. There is no registration fee. Hotel reservations may be made through Dr. Douglas C. Barker, 727 Eccles Building, Ogden.

WEST VIRGINIA

Home Town Medical Care for Veterans.—The new agreement between the Veterans Administration and the West Virginia State Medical Association, providing for continued home town medical care for veterans, has been approved effective April 1. The fee schedule which surplants the one formerly in force was mailed before April 1 to each of the nine hundred and six members of the association who participate in the program.

State Health Conference.—The West Virginia State Health Conference will be held May 27 at Hotel Prichard, Huntington. Speakers will include:

Dr. Royd R. Sayers, Washington, D. C., United Mine Workers of America Welfare and Retirement Fund.
Robert Koopman, Ph.D., Lansing, Mich., School Health Services.
Roscoe P. Kandle, New York, Health Survey in West Virginia.
Felix J. Underwood, Jackson, Miss., Problems of Improving the Supply of Professional Personnel.
Miss Donna Pearce, Richmond, Va., Newer Trends in Public Health Nursing in the Total Health Program.
Dean W. Roberts, Baltimore, Control of Chronic Diseases.
Mr. Elton D. Woolpert, Washington, D. C., Current National Health Legislation.

WISCONSIN

Marquette University Alumni Clinic.—The Spring Clinic of the Marquette University Alumni will be held May 13 at the Milwaukee County Hospital in the morning; and there will be a program beginning at 2 p.m. in the auditorium of the medical school. Subjects to be discussed include "Gallbladder Disease with Coronary Heart Involvement," "Curtis Grafts for Hernia," "Carcinoma of the Lower Colon" and "Treatment of Deafness."

Graduate Teaching Clinics.—The Council on Scientific Work of the State Medical Society of Wisconsin has arranged three Postgraduate Teaching Clinics for June 1-3. They are scheduled at the Hotel Stoddard, La Crosse, June 1; at the Hotel Wausau, Wausau, June 2, and at the Hotel Manitowoc, Manitowoc, June 3. The teaching staff will be Drs. John W. Harris, University of Wisconsin Medical School, Madison; Arthur A. Schaefer, Marquette University School of Medicine, Milwaukee; Reynold A. Jensen, University of Minnesota Medical School, Minneapolis, and Willard O. Thompson, University of Illinois College of Medicine, Chicago. In the late afternoon of each clinic the local county medical society will present a pathologic clinical conference with all four members of the faculty as participants. The registration fee of $4, which will cover the noon luncheon, should be sent to C. H. Crownhart, Secretary, State Medical Society, 917 Tenny Building, Madison 3.

GENERAL

Anniversary of School for Mentally Deficient.—The meeting of the American Association on Mental Deficiency in Boston May 18-22 marks the one hundredth anniversary of the first school for mentally defective children in America, established in South Boston and being continued at the Walter E. Fernald State School in Waverley. All those interested are invited. For reservations for rooms write direct to the Copley Plaza Hotel.

Research on Peptic Ulcer.—A finance committee, under the chairmanship of Dr. Clifford J. Barborka, Chicago, is seeking funds to finance research in the field of peptic ulcer. A committee of the American Gastroenterological Association for the study of peptic ulcer disclosed a need for coordination of studies on peptic ulcer, and a larger number of trained investigators. The committee was empowered with three subcommittees to evaluate the three fields, vagotomy, psychosomatic phases of ulcer and hormones in ulcer research and therapy. Members of the National Committee for the Study of Peptic Ulcer are: Dr. David J. Sandweiss, Detroit; Drs. Barborka, Andrew C. Ivy and Dr. Sara Jordon, Boston; Dr. T. Grier Miller, Philadelphia, and Dr. Owen H. Wagensteen, Minneapolis.

Pediatric Meeting.—The American Pediatric Society and the Canadian Society for the Study of Diseases of Children will meet May 24-26 at the Chateau Frontenac, Quebec, under the presidencies of Dr. Grover F. Powers, New Haven, Conn., and Dr. Alan Ross, Montreal, respectively. Subjects to be discussed include the psychotherapeutic role of the pediatrician, thyroid deficiency as a factor in conditioning the development of celiac disease, angiocardiography in congenital heart disease and the Rh factor. A symposium on viruses will be held on Wednesday beginning at 9 a.m. An informal dinner at 5:30 p.m. is scheduled for members and guests of both societies. The guest speaker will be William W. Greulich, Ph.D., professor of anatomy, Stanford University School of Medicine, Stanford University-San Francisco, on "Observations on the Children of Hiroshima and Nagasaki."

Medical Librarians' Meeting.—The forty-seventh annual meeting of the Medical Library Association will be held at the Warwick Hotel, Philadelphia, May 28-30, under the presidency of Mrs. Eileen R. Cunningham, Nashville, Tenn. The fiftieth anniversary of the Medical Library Association will be commemorated in the opening session. Dr. T. Archibald Malloch, librarian, New York Academy of Medicine, and Chauncey D. Leake, Ph.D., vice president, University of Texas, Galveston, will speak. Group meetings for various types of libraries will be held Friday afternoon. Problems to be discussed include those relating to training and personnel, exchange of material, indexing and abstracting. The annual dinner will be held at the Warwick Hotel on Saturday, 7 p.m. Dr. O. H. Perry Pepper, University of Pennsylvania, will speak on "Verbum Sap. Sat."

International Congress of Climatology and Thalassology. --American physicians are invited to attend the International Congress of Climatology and Thalassology at Riccione (Forli, Italy) June 12-13. Modern climatology in relation to the organization of Institutes for Thalassotherapy and Heliotherapy will be discussed. A preliminary program lists the following guest speakers: Drs. Alvar Gjertz, director, Institute for Physical Therapy of Karolinska Sjukhuset, Stockholm, Sweden; Jose de San Roman y Rouyer, director, Institute for Physical Therapy and Medical Hydrology, University of Madrid, Spain; F. Scheminsky, director, Institute for Scientific Research of Gastein, Innsbruck, Austria; Karl M. Walthard, director, Institute for Physical Therapy, University of Geneva, Switzerland. Information may be obtained from the secretary, Dr. Gino Moro, Direttore dell' Ospedale Civile, Riccione (Forli, Italy).

American Physical Therapy Association.--This Association will hold its annual convention May 23-28 at the La Salle Hotel, Chicago, Among the speakers will be Dr. Louis B. Newman and Miss Viola Bryson of the Veterans Administration Hospital, Hines, Ill., who will demonstrate the management of patients with injuries of the spinal cord. Dr. Sumner L. Koch, Chicago, will discuss nerve and tendon injuries of the hand; Dr. Harry D. Bouman, Madison, Wis., will speak Tuesday on physiology applied to muscle reeducation. Wednesday will be devoted to poliomyelitis. Speakers will be:

Robert L. Bennett Jr., Warm Springs, Ga., Functional Testing and Functional Training in the Care of Convalescent Poliomyelitis Patients.
Emil D.W. Hauser, Chicago, Care of Poliomyelitis from a Functional Point of View.
Geza DeTakats, Chicago, Clinical Aspects and Treatment of Peripheral Vascular Disease Including Physical Therapy.
David I. Abramson, Chicago, Physiology of Peripheral Circulation Including Pharmacology.

Eastern Electroencephalographers.--The annual meeting of the Eastern Electroencephalographers will be held May 15 at the U.S. Naval Hospital, Bethesda, Md. Clifford A. Swanson Surgeon general, U. S. Navy, Washington, D. C., will give the address of welcome. The program includes:

Frederick S. Brackett, Ph. D., Bethesda, Md., Electrochemical Phenomena at Surfaces.
Rafael Lorente de No, New York, Fields of Action Currents of Traveling Nerve Impulses.
Detlev W. Bronk, Ph. D., Philadelphia, Origin of Rhythmic Potentials in the Nervous System.
Harold E. Himwich, U.S. Army, Convulsant Patterns Produced by Electroencephalographic Diisopropyl Fluorophosphate.

At the Subscription Dinner in the Wardman Park Hotel, Washington, D. C., Lawrence C. Kolb director of research projects, Mental Hygiene Division, U. S. Public Health Service, will be the speaker.

Gordon Research Conferences.--Neil E. Gordon, Ph.D., professor of chemistry, Wayne University, Detroit, was honored at a dinner April 20 in Chicago, at ceremonies to rename the Gibson Island Research Conferences, which he originated, the Gordon Research Conferences. Begun in 1938, under the sponsorship of the American Association for the Advancement of Science, the annual summer-long conferences have brought together experts for the pooling of research data and the stimulation of suggestions aimed at the advancement of chemistry frontiers. Gifts from fifty-three industrial companies and from private research laboratories have aided the work. This year the conferences will be held from June 21 to September 3 at Colby Junior College, New London. Subjects of the program include vitamins and nutrition, foods and nutrition, medicinal chemistry and cancer. Additional information may be obtained from W. George Parks, Director, Department of Chemistry, Rhode Island State College, Kingston, R. I.

International Congress on BCG Vaccine.—The first International Congress on BCG Vaccine will be held in Paris, France, June 18-23 under the auspices of the president of the French Republic and members of the government of France, with Dr. C. Guerin, president, and Dr. L. Negre and Dr. J. Bretey, secretaries general. The subjects to be discussed are: experimental study of BCG vaccine and its modes of administration; results of its use in human patients; results obtained in veterinary practice and procedure with regard to its application within the frame of social action and prophylactic hygiene. The registration fee is 1,000 francs for the active members and 500 francs for the associated members. Information may be obtained from the secretary general of the Congress on BCG Vaccine, Institut Pasteur, 25, Rue du Doceur Roux, Paris, 15e.

CANADA

Annual Meeting of Canadian Medical Association.—The seventy-ninth annual meeting of the Canadian Medical Association will be held in the Royal York Hotel, Toronto, Ontario, June 21-25, under the presidency of Dr. Frederick G. McGuinness, Winnipeg, Manitoba. Round-table conferences have been arranged for Wednesday, Thursday and Friday from 9 to 10:30 a.m., to be followed by general sessions. Guest speakers include: Frank B. Walsh, Baltimore, myasthenia gravis; Phillip S. Hench, Rochester, Minn., subject to be announced; Bryan G. Maegraith, Liverpool, England, physiologic approach to medical problems; Sir William Fletcher Shaw, Manchester, England, the scientific outlook, and Clarence O. Sappington, Chicago, modern methods of health protection in industry. The Lister Lecture will be given by Dr. William E. Gallie, Toronto, on "The Practice of Surgery in Canada."

LATIN AMERICA

Summer Course on Tropical Medicine.—From July 5 to August 5 a special course on tropical medicine will be given in Lima, Peru, with the cooperation of members of official and university institutions. The course will chiefly include subjects related to verruga peruana (Carrion's disease) and the physiologic and pathologic aspects of life at high altitudes. Lectures will be supplemented by laboratory work and trips to areas where personal experience in the aforementioned subjects may be obtained. The National Tourist Corporation of Peru is in charge of the travel arrangements. Information may be obtained from the Institute of International Education, 2 West 45th Street, New York 19.

Marriages

LEONARD B. ROSE, Bladensburg, Md., to Dr. Beatrice J. Kartus of Washington, D.C., January 11

CONSUELO IVES to Mr. Frank Bruce Ashley Jr., both of New York, January 31.

WILLIAM REYNOLDS NESBITT, Richmond, Calif., to Miss Bernice Bedwell at Berkeley, February 20.

JOHN HENRY DOHERTY, Scranton, Pa., to Miss Florence Eileen Duffy of New York, January 31.

Deaths

Gerald Bertram Webb ⊕ Colorado Springs, Colo.; born in Cheltanham, England, Sept. 24, 1871; Denver College of Medicine, 1896; member of the House of Delegates of the American Medical Association, 1920-1921; fellow and formerly vice president of the American College of Physicians; member and past president of the Colorado State Medical Society, National Tuberculosis Association, American Association of the History of Medicine, American Clinical and Climatological Association and the Association of American Physicians; member of the American Association for Thoracic Surgery; specialist certified by the American Board of Internal Medicine; past president of the Colorado Board of Medical Examiners; had been delegate to several international congresses on tuberculosis; during World War I senior tuberculosis consultant with the American Expeditionary Forces; associated with the Glockner Sanatorium and Hospital and the Union Printers Home and Tuberculosis Sanatorium; president and research director of the Colorado Foundation for Research in Tuberculosis; in 1939 awarded the Trudeau Medal of the National Tuberculosis Association; received the doctor of science degree from Colorado College in 1936 and from the University of Colorado in 1939; author of "Tuberculosis", and "Rene Theophile Hyacinthe Laennec; a memoir"; joint author of "Henry Sewall, Physiologist and Physician," "Overcoming Tuberculosis"; died January 27, aged 76, of coronary thrombosis.

Charles Henry Henninger ⊕ Pittsburgh; born in Butler County, Pa., Sept. 16, 1874; Western Pennsylvania Medical College, Pittsburgh, 1900; professor of psychiatry at his alma mater; specialist certified by the American Board of Psychiatry and Neurology, Inc.; member of the House of Delegates of the American Medical Association from 1941 to 1944; served as president of the Medical Society of the State of Pennsylvania, Allegheny County Medical Society, Pittsburgh Academy of Medicine, Pennsylvania Hygiene Committee, Public Charities Association, Pittsburgh Neuropsychiatric Society and Pennsylvania Psychiatric Society; member of the Association for Research in Nervous and Mental Diseases and the Pittsburgh Biological Society; a major in the medical corps of the U.S. Army during World War I; served as clinical director and assistant superintendent of the State Institution for the Feeble-minded and Epileptics, Polk, Pa., from 1901 to 1905; at various times on the staffs of St. Francis, Children's, Elizabeth Steel Magee, Columbia and St. John's hospitals; member of the consulting staffs of the Pittsburgh City Home and Hospitals in Mayview and of the Allegheny County Workhouse; died February 18, aged 73, of coronary occlusion.

James Day Edgar ⊕ Captain, U.S. Army, retired, Whittier, Calif., born in Redfield, S.D., Nov. 16, 1889; University of Minnesota Medical School, Minneapolis, 1915; specialist certified by the American Board of Pathology, Inc.; member of the American Society of Clinical Pathologists; served during World War I; entered the medical corps of the U.S. Army in June 1918;retired July 31, 1922 for disability sustained in line of duty; returned to active duty from August 1924 to August 1939; pathologist at Murphy Memorial Hospital; died January 20, aged 58.

Connie Holt King ⊕ Duxbury, Mass.; born in Headsland, Ala; July 16, 1907; University of Tennessee College of Medicine, Memphis, 1929; formerly a medical officer in the U.S. Navy and an intern at the U.S. Naval Hospital in Norfolk, Va.; served a residency at the Norfolk County Hospital in Braintree; associate medical examiner for Plymouth County; school physician; formerly a medical officer of the U.S. Public Health Service; on the staff of the Jordan Hospital in Plymouth; died January 22, aged 40, of coronary thrombosis.

William Gee Allen ⊕ Erie, Pa.; University of Pennsylvania School of Medicine, Philadelphia, 1918; fellow of the American College of Surgeons; chief of the surgical staff of Hamot Hospital; died January 23, aged 59.

William Benjamin Allums, Shreveport, La.; Medical Department of Tulane University of Louisiana, New Orleans, 1909; member of the American Medical Association; fellow of the American College of Surgeons; died January 30, aged 65.

Franklin F. Arndt, Scranton, Pa.; University of the City of New York Medical Department, New York, 1883; member of the American Medical Association; served on the staffs of the Hahnemann Hospital, Pittston (Pa.) Hospital, Wilkes Barre (Pa.) General Hospital and the Nesbitt Memorial Hospital in Kingston; died January 11, aged 88, of carcinoma.

Elliott L. Baker Sr., Columbus, Ga.; Atlanta Medical College, 1895; served during World War I; died January 10, aged 72.

Walter A. Bayley ⊕ Los Angeles; University of Southern California College of Medicine, Los Angeles, 1905; associate clinical professor of surgery at his alma mater; fellow of the American College of Surgeons; specialist certified by the American Board of Surgery; served during World War I; affiliated with Presbyterian Hospital-Olmsted Memorial and California, Methodist, Cedars of Lebanon and Mount Sinai hospitals; died in the Veterans Administration Hospital in West Los Angeles January 4, aged 67.

Edgar Rolland Beidelman ⊕ Bethlehem, Pa.; Jefferson Medical College of Philadelphia, 1915; for many years affiliated with St. Luke's Hospital, where he died January 26, aged 63, of cerebral hemorrhage.

Frank M. Bleakney, Grove City, Pa.; Jefferson Medical College of Philadelphia, 1900; died recently, aged 71, of cardiorenal vascular disease.

Delphia Louk Brower, Rialto, Calif.; University of Kansas School of Medicine, Kansas City, 1944; interned at the Orange County General Hospital in Orange; affiliated with the St. Bernardine's Hospital, San Bernardino, where he died December 29, 1947, aged 30, of leukemia.

William Sydney Burgess, Sumter, S. C.; Medical College of the State of Carolina, Charleston, 1912; member of the American Medical Association; attached to the British Army and served as captain in the U. S. Army during World War I; for many years affiliated with the Tuomey Hospital, where he died January 31, aged 57.

Andrew Carr, Minot, N.D.; Rush Medical College, Chicago, 1888; member of the American Medical Association; past president of the North Dakota State Medical Association; affiliated with Trinity and St. Joseph's hospitals; died January 22, aged 93, of senility.

William Henry Chambers, McKeesport, Pa.; Ohio Medical University, Columbus, 1898; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1899; for many years a member of the board of health; died January 21, aged 74, of carcinoma.

Frederick George Clark, Los Angeles, Jefferson Medical college of Philadelphia, 1908; died January 9, aged 71.

Typhoid

H. Vincent has recently demonstrated the effect produced by the injections of two separate toxins in animals. Guinea pigs receiving neurotoxin manifest characteristic prostration as the predominant factor before death; those receiving enterotoxin show congestion of the small intestine as well as of the adrenal capsule and Peyer's patches at necropsy. These last ulcerated during a slow death (two to three days). Horses are extremely responsive to subcutaneous or intravenous injection of the two toxins. Early restlessness followed by prostration for two to twelve hours, diarrhea, acceleration of the pulse rate and respiratory rate and fever occur. In this way the author establishes the essentially toxemic character of typhoid. Remarkable successes occur in patients treated with a purely antitoxic serum.

R. Dana reported 105 cases of serious typhoid treated orally with 3 to 4 Gm. of sulfonamide drugs if the urine showed colon or paracolon bacilli or other organisms. If there was leukocytosis with polynucleosis he gave sulfonamide drugs by injection (2 to 3 Gm. a day). Penicillin is added (200,000 to 1,000,000 units) if sulfonamide drugs fail. Transfusions of citrated blood are given at frequent intervals in serious cases. Contraindications to the use of sulfonamide drugs are nephrotyphus with hematuria and severe azotemia and the appearance of cyanosis. The recovery rate is high. The former death rate for Tunisia (20 to 30 per cent) is reduced to 3 per cent at the Liberation Hospital.

Bacteriophage and Penicillin

The French Society of Bacteriology has commemorated the thirtieth anniversary of the discovery of bacteriophage by Professor d'Herelle, who emphasized the importance of bacteriophages in the treatment of war wounds. A. Raiga, formerly chief of surgical clinics of the Paris Faculty, explained the biologic causes responsible for certain failures in penicillin therapy. Infection is a problem with two factors, bacteria and terrain; there is also natural recovery: bacteriophagia. The terrain may be rendered unfavorable to bacteriophage production by antiphagic properties of the blood which oppose natural cure. Inhibitory properties were illustrated in photographs of bacteriologic preparations by N. Boulgakov. According to the author, penicillin therapy can only be successful when favored by the phenomenon of natural recovery. In 65 of 67 failures with penicillin the presence of antiphagic properties was demonstrated. Moreover, success with penicillin coincides with the absence of antiphages.

International Union Against Cancer

The board of Directors of the International Union Against Cancer will meet in Paris Dec. 10-11, 1948, for the first time since the war. Elections will be held, and place and program of the Fifth International Congress for Cancer will be considered. Modification of statutes of the International Union Against Cancer and their adaption to decisions of the fourth congress toward establishing a Research Committee with financial autonomy will also be considered.

The quarterly review "Acta," published by the International Union Against Cancer, has resumed publication after seven years' interruption. For information apply to the headquarters of the organization, 6 Avenue Marceau, Paris, 8.

First International BCG Congress

At a meeting of the National Academy of Medicine, Guerin and Weill-Halle, back from the United States, related the interest in BCG vaccination at the New York International Congress of Pediatrics. They believe that the time has come to compare, on an international scale, the various technics and to discuss their respective effectiveness. The academy fully endorsed their resolution to convene an International BCG Congress. It has been organized by the Pasteur Institute and will take place in Paris June 18 to 23, 1948, under the honorary presidency of Professor Trefouel, director of the Pasteur Institute, and under the presidency of Dr. Guerin. The following subjects are on the agenda: (1) experimental study of BCG vaccine and methods of administration; (2) results of its use in human beings; (3) results obtained in veterinary practice, and (4) methods of application in the fields of social action and preventive hygiene. This congress will also commemorate the beginning of the use of BCG in man and will celebrate the fiftieth anniversary of the Lille Pasteur Institute, which was founded by Calmette and in the laboratory of which he and Guerin have carried on most of their experiments on BCG vaccine. For information apply to: Secrétariat Général du BCG, Institute Pasteur, 25 Rue du Docteur Roux, Paris, 15.

Congresses

An International Hematology Meeting, organized by the French Society for Hematology, Professor P. Chevallier presiding, will take place in Paris May 22-23, 1948 at Hotel Dieu hospital.

An International Meeting of Medical Students (under Laennec organization) at the International Cultural Center of Royaumont (Seine and Oise) will be held July 20-30, 1948. Experimentation on the human being, artificial insemination, birth control, social security and modern eugenics will be considered. For information apply to Secretary's office, 12 Rue D'Assas, Paris, 6.

ITALY

(From Our Regular Correspondent)

Naples, March 16, 1948.

Epidemic of Homologous Serum Hepatitis

One of the gravest epidemics of homologous serum hepatitis ever known recently occurred in Italy in Varese, a small town near Milan. The responsibility for the epidemic is said to lie on a self-practicing doctor of the town, who is now in custody pending investigation. Having practiced there for years, this doctor has attended some 17,000 persons (about 32 per cent of the entire population) and has done an average of fifty intravenous injections per day. Patients inoculated with his own drugs commenced to show, a few days afterward, general debility, vomiting and then, either with or without fever, symptoms of jaundice. First deaths from the disease came toward the end of 1946, and the number soon amounted to 12. At least 100 other patients showed symptoms of the illness. All had been treated by this doctor, except 1 child. The mother of the child, however, was treated with fatal results.

At first this doctor was not suspected of aiding the spread of the infection, in view of his fine professional record. Then suspicion began to fall on the drugs used in treatment, drugs provided by the doctor himself. It appears that, owing to a shortage, he had used drugs taken over from the German troops previous to their expulsion from Italy. Since the Germans had poisoned the water supplies before leaving, it was feared that the drugs were also contaminated. Laboratory examination, however, showed them to be free from adulteration. Meanwhile, growing apprehension indicated that there must be a connection between his treatment and the increased occurrence of infection. He then began to send patients to Milan for treatment as soon as the illness was diagnosed. In the course of a week the hospitals of Milan had dozens of cases of jaundice, all of which could be traced back to Varese. After what was considered a grave transgression of procedure on the part of the doctor, as reported by the director of the Varese Hospital, the doctor was arrested and charged with having transposed the names on tubes containing blood samples of 2 patients, 1 from his own ward, and 1 from another ward not under his supervision. The samples of blood from his patient was to have been tested for the presence of germs which could only have been introduced by one of his previous injections.

It was thought that the doctor was at fault in his technic used in sterilization of the instruments. He did not always subject needles and syringe to boiling for as long as twenty minutes. Often, owing to the large number of patients treated, he boiled the instruments for only four minutes. He used disinfecting solutions of Swiss manufacture, but he had never suspected them. The epidemic remained mysterious and the inhabitants of Varese were terrified by this menace in their midst. A Swiss citizen then wrote to the Italian press describing a similar epidemic which had broken out a few months before at Dasilia. The *Neue Zürcher Zeitung* had described this epidemic and referred to the high death rate. It was then supposed that the first source of infection in Italy was a Swiss citizen who had probably been treated by the doctor of Varese. But while the doctor was under arrest, other cases of the "yellow disease" occurred in a town near Lake Maggiore, where the unfortunate doctor had never been. Justice, however, seemed to ignore this fact and the doctor is still being held pending court proceedings.

April 9, 1948.

A New Domus Medica at Last

On March 29, 1947 an account was given in these columns of plans for rebuilding Domus Medica, the headquarters in Copenhagen of the Danish Medical Association and the Danish Medical Society. This building, burned during the German occupation of Denmark, had stood as the symbol of all that is best in Danish medicine. Hence the determination to rebuild it as soon as possible, whatever the difficulties. Three million Danish kroner were mentioned as a likely estimate. Even if this sum were forthcoming, how many years would be needed in which to convert it into bricks and mortar?

Matters were at this none too cheerful stage when, on January 23 of this year, Dr. V. A. Fenger, the enterprising secretary of the Danish Medical Association, happened to read in the daily press an advertisement of a palatial building in Copenhagen for sale. The owner was promptly approached and negotiations were started. Representatives of the Medical Association and the Medical Society inspected the building and were greatly impressed by it. The Central Committee of the Medical Association met on January 31, and on February 8 an emergency meeting of the representatives of the association was held. At this meeting the pros and cons were discussed, and the pessimists were given an opportunity to join issue with the optimists. A two-thirds majority was required for this prospective purchase, and it was obtained by the optimists by a narrow margin, 52 to 26. The purchase price is 1,500,000 Danish kroner, and the Medical Association will take possession on June 1, 1948. The necessary alterations will, of course, be costly, but by renting the space it does not need to other bodies, the medical association will be able to obtain some immediate return on its outlay. This new Domus Medica will, of course, be of greater use to the physicians of Copenhagen than to those in the provinces; and in order to repair this inequality to some extent, it is proposed that students from doctors' homes in the country shall be lodged in this building, which will thus acquire the character of a residential college.

Contraceptive Education

Broadly speaking, Danish physicians belong to two main groups in the matter of contraceptives. The older doctors learned nothing about them when young, and many have held aloof from them ever since. For the younger physicians contraception was a subject on which, as medical students, they had to satisfy their examiners. Both groups look to the Danish Medical Association for guidance on the principles governing this problem, and now the Central Committee of the association has issued a memorandum couched in no uncertain terms. Physicians are urged not only to master this subject but also, in individual cases, to act on their own initiative when considerations of health; heredity or particularly difficult social circumstances contraindicate future pregnancies. The Hygiene Committee of the Danish Medical Association has for several years been studying contraception by certain chemicals in hope that they may replace the pessary, whose manipulation requires a dexterity which is sometimes lacking. This committee is hopeful over the prospect of finding a chemical whose application can be varied so as to meet all the requirements of patients with different mental, social and esthetic standards.

Abortions Induced for Psychiatric Reasons

Among 600 presumably pregnant women admitted to the Psychiatric Department of the Bispebjaer Hospital in the seven year period July 1938 to July 1945 were 547 candidates for induced abortion. Dr. C. Clemmesen and Dr. Gertrud Kirkegaard have classified these patients as follows: 10 proved not to be pregnant, 12 aborted spontaneously in the hospital and 400 were refused abortion. Thus abortion was induced in only 125 cases. A comparison of the ages of the women granted or refused abortion showed a fall of the refusal rate as the age rose. There was little difference between the married and the unmarried in this respect, but the refusal rate was comparatively high among widows and wives separated or divorced from their husbands. The refusal rate was lower when the prospective father was a casual acquaintenance than when he was the husband or lover. The main indication for the induction of abortion was ill health in 42 per cent and the risk of suicide in 16 per cent.

Correspondence

MORE ABOUT VAGOTOMY

To the Editor:—The editorial entitled "More About Vagotomy" on page 255 of the January 24 issue of THE JOURNAL states, "There is also a definite effect on the secretion, in most instances shown by histamine achlorhydria." The writer undoubtedly meant to say "insulin achlorhydria." All the evidence clearly shows that the hydrochloric acid secretion produced by histamine stimulation is not abolished by vagotomy. The insulin test of gastric secretion is generally recognized as a reliable means of determining whether the vagotomy has been complete, so that it is quite probable that the writer had this test in mind when he wrote the statement quoted.

MORRIS KESILMAN, M.D., Philadelphia.

COMMENT.—The statement that "there is also a definite effect on the secretion, in most instances shown by histamine achlorhydria" was unfortunately an error. There appears to be no abolition of secretion after a perfect vagotomy. What is abolished is the cephalic phase of the secretion. Vagotomized *stomachs*, according to Dragstedt, will react with secretion not only to histamine and to insulin but also to a protein meal. The claim that Dragstedt makes with regard to this particular point is that the cephalic phase of the secretion is abolished. The sentence quoted by Dr. Kesilman would be wrong even if "insulin" were *substituted for* "histamine".—Ed.

To the Editor:—I cannot agree with your comment in its entirety, specifically where you state that Dragstedt claims that the vagotomized stomach will secrete *in* response to insulin stimulation. In the November 1947 issue of *Annals of Surgery,* page 687, he makes the following *statement:*

> In these 160 patients, the vagus section was complete in 142 cases as evidenced by a reduction in the night secretion of gastric juice, a decrease of over 60 per cent in the total hydrochloric output from the stomach, and a negative secretory response to insulin hypoglycemia.

On page 688 he summarizes the case histories of 2 patients who had recurrences *after* vagotomy and in whom the insulin test was positive, indicating that the vagotomy had been incomplete. These patients were reoperated on and in each the remaining vagus fiber was found and sectioned, after which the test became negative. A protein meal invokes the local humoral mechanism through the mediation of the hormone called gastrin, which is believed by some to be identical with histamine and is not affected by vagus nerve function.

The statement that vagotomy abolishes the cephalic phase of gastric secretion is correct, but I do not like to use this term because of its association with the description of the so-called psychic, or appetite, secretion which occurs prior to the ingestion of food. This tends to narrow the influence of vagus activity in the mind of the reader and neglects to emphasize the important interdigestive and the nocturnal gastric secretion which are also under vagus control. Dragstedt usually describes vagotomy as abolishing the nervous phase of gastric secretion.

MORRIS KESILMAN, M.D.,
2132 Pine Street,
Philadelphia.

LEGISLATION ON AIR POLLUTION

To the Editor:—My interest in the control of urban air pollution led me to seek further information on the Niagara Falls, N. Y., ordinance which was given such enthusiastic mention in the Medical News columns (THE JOURNAL, January 31. p. 339). *Direct query to the director of air pollution control at Niagara Falls elicited the information that the Industrial Hygiene Division of the U. S.* Public Health Service had no part in formulating the ordinance, contrary to the statement in THE JOURNAL. Furthermore, careful *perusal of* the ordinance as it *now stands fails to reveal anything* unique in its provisions—it is patterned after the American Institute of Engineers' standard proposal, which still relies for enforcement *on the constant policing of* all the city's old flues and locomotive smokestacks for illegal *smoke emission.*

Control of smoke production by the policing of the multitude of city flues has been demonstrated to be ineffective and is being abandoned in favor of regulations which make *harmful* smoke production *impossible. Such regulations prohibit the sale of* highly volatile coal *for use in hand-fired furnaces* and *enforce a change of Diesel or electric power* for railroad switching purposes within metropolitan limits as the two most important points in smoke control.

Policing of smoke production *from* individual stacks and flues breaks down completely for the greater part of each winter season when the smoke problem is most acute, *for the simple reason that smoke* readings can be made and infractions cited only during daylight hours and absence of mists or fogs. Even on clear days of cold winter weather, the white steam emitted by *locomotives* can effectively mask dense smoke.

In view of the exceedingly *significant* relationship of air pollution to respiratory *disease* death rates in industrial cities, it is important that those interested in personal and public health insist on really effective legislation whenever the *matter is under consideration in their home* community.

CLARENCE A. MILLS, M.D., Cincinnati 29.

NOMENCLATURE OF FRACTURES

To The Editor.—*I have just received from Dr. H. Earle Conwell of Birmingham, Ala., a reprint of his note to* THE JOURNAL *with regard to nomenclature of* fractures. Dr. Conwell recommends the *term* "complex simple fracture" for "complicated simple fracture" and quotes Webster's definition of *complex. However,* he quotes only the definition *of the noun, which* does not apply. To make sense he should have quoted the definition of the adjective, viz., "involving many parts; *complicated;* intricate." Not to complex (Webster's transitive verb) the issue, the real confusion stems from the original terms, simple and compound, neither of which *means* anything as applied to fractures.

As one not learned in etymology or other branches of philology, including semasiology, but acknowledging *the need of descriptive* values in nomenclature, I suggest dropping the designations "simple" and "*compound*" in favor of "closed" and "open." Qualifying adjectives such as complicated, crush*ing or comminuted* should be used together *with* morphologic descriptive terms as to location of the *fracture in* the bone and its direction.

Certainly a fracture of the tibia and fibula with the skin *unbroken but* everything else in the leg *completely smashed* can hardly be called a simple fracture, no matter what descriptive adjectives may be applied fore or aft.

RICHARD B. DILLEHUNT, M.D., *Portland, Ore.*

Miscellany

SITUATION IN PSYCHIATRY

Dr. William C. Menninger in the January *Bulletin of the Menninger Clinic* has compactly compiled "Facts and Statistics of Significance for Psychiatry."

1. *Military Service.*—Among 15 million men examined for U. S. military service in World War II, 1,846,000 were immediately rejected, 250,000 were discharged administratively and 382,000 were discharged medically, a 2,480,000 man power loss due to neuropsychiatric disorders. Among all medical discharges, 37 per cent in the army and 32.4 per cent in the navy were due to neuropsychiatric disorders. Administrative discharges both in the army and the navy included cases of psychopathic personality, mental deficiency, drug addiction and homosexuality. Combat produced two types of casualties, both arising from conditions over which the men themselves had little or no control; the one received an honorable discharge due to physical injury or illness and the other on discharge was stigmatized as neuropsychiatric.

2. *Mental Hospitals.*—There were 100,000 new admissions to state mental hospitals in 1943 and 271,209 admissions in 1946. In 1946, of a total United States hospital bed capacity of 1,468,714, 674,939 were in mental hospitals, or 46 per cent of total bed capacity. American Hospital Association figures for the year ending September 1946 state that 51 per cent of all hospital beds were for mental patients.

3. *Minor Mental Disorders.*—In military service 3 to 7 per cent of all trainees were seen at mental hygiene clinics; of these, only 7 per cent needed hospitalization. Spot surveys in civilian life indicate that 30 per cent of hospitalized medical and surgical patients are somewhat neurotic, 58 per cent of an unselected group of patients displayed harmful mental reactions and in 26 per cent of the group emotional reactions were the chief cause of illness. Forty-eight per cent of patients consulting gastroenterologists have no organic gastrointestinal disease.

A wide variation occurs in estimates of incidence of functional disorders among all patients consulting physicians. Estimates vary from 35 to 70 per cent, averaging about 50 per cent.

4. *Costs.*—Standards approved by the American Psychiatric Association are $5 per day for acutely ill and recovering patients and $2.50 per day for those with chronic states. Actual costs for general hospital patients average $7 to $11 per day. Present expenditures for mental patients are $1.05 per day or approximately $165,000,000 per year; an average of at least $5 per patient day, which is about $700,000,000 per year, is needed. Dr. Menninger compares this needed cost to other examples of consumer expenditures, indicating that the needed figure is still $150,000,000 per year less than expenditures now made for funeral services, cemeteries and tombstones.

5. *Personnel.*—Approved standards for state hospitals average one psychiatrist for 30 to 50 regular patients and one psychiatrist for 200 senile and arteriosclerotic patients. Army standards require one psychiatrist to 50 patients. Based on figures for 1945 there is shown to be a deficit of 42 per cent of employees of all categories, 74 per cent of physicians, 92 per cent of psychologist, 80 per cent of nurses, 87 per cent of dietitians and 71 per cent of social workers.

Four thousand, four hundred and thirty-two psychiatrists are registered in the membership of the American Psychiatric Association. An estimated immediate need for 10,000 to 14,000 additional psychiatrists exists. It was stated that the Veterans Administration alone could easily use to advantage all first class psychiatrists in the country at the present time. Comparable deficiencies of clinical psychologists, psychiatric nurses and psychiatric social workers exist. There are now needed 1,700 additional clinical psychologists, and an estimated 4,500 to 10,000 psychiatric social workers; the Veterans Administration alone will need more than 5,000 additional psychiatric nurses.

6. *Training Opportunities and Needs.*—Average medical school curriculums of 5,000 hours allot only 1 to 5 per cent of the time schedule for training in psychiatry in contrast to the 30 to 50 per cent of all patients seen in medical practice who present problems that are primarily mental. In 1946 there were 758 approved internships and residencies in psychiatry in one hundred and fifty-five hospitals. The Veterans Administration currently has 401 residencies in psychiatry and expects to increase this number to 600 by 1948 and to 1,083 by 1960. Thirty-one universities now offer training in the field of clinical psychology; but there is a shortage of facilities for training. The Veterans Administration is providing additional facilities for training psychiatric social workers. Psychiatric nursing is now included as a postgraduate course in the curriculums of ten universities and several graduate training centers.

7. *Research.*—Psychiatric research was estimated to amount to only $2,000,000 a year, although loss from mental ill health amounts to over a billion dollars yearly. For every dollar spent on psychiatric research $65 are spent on other types of medical research and $2,500 in industrial research. In poliomyelitis research costs average $100 per case and in psychiatry, $1 for each known case of total mental disability.

8. *Social Problems.*—Social problems having important significance for psychiatry are considered. Certain problems represent the result of mental ill health, others are causes of mental ill health and still others are evidence of existing mental health.

(*a*) Comparative Costs: Comparative expenses for constructive purposes and for luxury are stated as follows:

Comparative Costs

Constructive Expenses	
Medical care, 1945	$3,600,000,000
Recreation, 1945	$3,000,000,000
Public school expenditures, 1940	$2,308,000,000
Reading material, 1942	$1,000,000,000

Luxury Expenses	
Beer, wine, liquor, 1946	$7,700,000,000
Tobacco, 1945	$3,000,000,000
Jewelry, 1945	$3,100,000,000
Cosmetics, 1946	$699,600,000

(*b*) Accidents and Alcoholism: Three hundred and fifty thousand disabling accidents occur yearly, of which 22 per cent result wholly from personality causes and 60 per cent from a combination of mechanical and personality causes. There are 600,000 chronic alcoholic addicts in the United States and 2,400,000 excessive drinkers. In 1945, 750,000 persons were defined as having a diagnosable bodily or mental disorder from prolonged excessive drinking. Conservative estimates are that alcoholism costs the American public about $1,000,000,000 yearly.

(c) Crime: *In* 1946, 18,698 prisoners were confined in federal institutions and approximately 118,000 prisoners in state penal institutions. Twenty-five to thirty thousand of these persons were under 21 years of age. Crimes in 1946 broke all records for the last decade, reaching a total of 1,685,203, an increase of 119,633 over 1945. The cost of crime to the American public was estimated to be between 10 and 18 billion dollars a year to operate one hundred and forty-seven federal and state penal institutions.

(d) Delinquency and Education: Two hundred and fifty thousand to 400,000 adolescents pass through juvenile courts each year, and about 29,000 "pupils" are detained in one hundred and forty-two schools for juvenile delinquents.

In 1940, 3.7 per cent of persons aged 25 years or over in the United States had no schooling and 13.5 per cent had fewer than five years of schooling. The army literacy training program provided for 107,075 men. Only one-fourth of those who leave school do so because they are not interested. Over one-half drop out because of the economic difficulties of continuance. Two million children between the ages of 6 and 15 years were not in any kind of school in 1940.

(e) Divorce: In 1915 there were 10.3 marriages per thousand to 1 divorce; in 1935, 10.4 marriages to 1.7 divorces, and in 1945, 12.3 marriages to 3.6 divorces. In numbers, 249,000 divorces were granted in 1937 and 502,000 in 1945.

(f) Illegitimacy: Eighty-three thousand births out of wedlock occurred in 1943 in the United States, exclusive of those in ten large states which do not record legitimacy on birth registrations. Almost one half of these births were to mothers 15 to 19 years of age.

9. *College Graduates.*—Both men and women fail to reproduce sufficient offspring to replace themselves; it is calculated that 2.22 children must be born per graduate to allow a child to reach the same age at which the parent graduated. Men of classes of 1922 had 1.7 children and those of 1937, 1.11 children per graduate. Women graduates of 1922 had 1.36 children per graduate and of 1937, 1.06 children per graduate.

10. *Housing.*—The national census in 1940 revealed that only 61.7 per cent of 27,723,008 nonfarm homes were standard. (A standard home is one in need of no major repairs and possessing modern plumbing—private flush toilet and bath.) More than 3,500,000 homes did not have a private toilet and bath, and 3,000,000 more lacked running water and plumbing of any description.

11. *Mental Deficiency.*—The estimated extent of mental deficiency in the United States varies from 1,500,000 to 4,500,000. Draft experience showed that 4.5 per cent of all men examined, a total of 676,300, were mentally defective. In 1941 there were approximately 115,000 mentally defective persons in institutions in the United States, 12,315 being first admissions during the year. Approximately 2 per cent of children of school age have enough difficulty to prevent their education in the usual school.

12. *Minority Problems.*—There are 13,454,585 nonwhite persons and 11,419,138 foreign born white persons in the United States. Symptoms of disorder among the majority group are prejudice, ignorance, tension, hate and fear; among the minority group, unhappiness, resentment, fear, poverty and suffering. Expressions of this problem are segregation (Jim Crowism) in housing, travel, recreation, employment, politics, education and medical care. Secret surveys of United States racial and religious intolerance show that large groups, up to 36 per cent, show envy, distrust or plain dislike for Jews, Negroes, Catholics and Protestants in various parts of the country and have suspicions that one or the other groups have too much economic or political power. Other unpublished surveys reveal that 28 per cent, on being questioned as to what should be done about it, favored taking strong measures for changes in the direction of greater tolerance (22,000,000 persons favored active measures to promote greater tolerance).

13. *Physical Handicaps.*—There are 20,000,000 disabled men and women in the United States, or one-seventh of the population. Of these, at least 1,500,000 handicapped persons could be made employable. Based on past figures, every dollar spent for rehabilitation returns $47 to society.

COMMENT

The general assumption that the mentally ill can be separated from society and segregated in hospitals under the care of physicians has changed radically. Unfortunately, however, there are far too few psychiatrists to keep up with the expanding field. Psychiatrists have tended, hampered by this lack, to limit their efforts to clinical work with a few patients rather than to try to solve the ills of the many. Psychiatrists are medical scientists with specialized knowledge which can be applied to social problems. Knowledge of these problems and their solution is now inadequate and needs extension by research and education reenforced by enlistment of additional personnel. The magnitude of the psychiatric problem has been in great part uncovered during the war years. Human unhappiness and maladjustment which were formerly accepted for lack of other solution are now considered by persons so affected as being amenable to psychiatric treatment, thereby creating increased demand for trained personnel and heavily increased expenditures for scientific research before the many associated problems to which Dr. Menninger refers may be successfully combated.

Medical Motion Pictures

NEW MOTION PICTURES ADDED TO A. M. A. FILM LIBRARY

New Frontiers of Medicine. 16 mm., black and white, sound, 600 feet (one reel), showing time seventeen minutes. Produced in 1948 by March of Time Forum Edition, New York. Procurable on loan from the American Medical Association, Committee on Medical Motion Pictures, 535 North Dearborn Street, Chicago 10.

This motion picture acquaints its audience with new medical progress by depicting the discoveries of men who are working to prolong man's life and more healthful living. New drugs such as sulfonamide compounds, penicillin and streptomycin and new fields of study such as Rh blood factor, the artificial kidney, brain surgery and nutrition are mentioned. Progress in the field of heart disease, cancer and rheumatic fever are included in the contents of this film. Scientific aids such as the fluoroscope, the x-ray machine and the electrocardiograph are demonstrated. This production should be suitable for lay audiences, especially for physicians to use in lecturing to service organizations and similar groups.

The motion picture entitled "Accident Service" which was reviewed in THE JOURNAL January 31, page 348, is now available on a loan basis through the Committee on Medical Motion Pictures, American Medical Association, 535 North Dearborn Street, Chicago 10.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1937 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied with stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Leprosy. C. Shaw.—p. 338.
Significance of Diastolic Murmurs. S. Strauss.—p. 341.

Sequelae of Acute Hepatitis.—According to Spellberg, residuals of acute hepatitis may be classified as the chronic form, the recurrent form and the progressive irreversible type. The last is the most important type. Much contradictory opinion occurs regarding this sequela. Biopsies were obtained from 3 men aged 39, 33 and 53, respectively. The first was vaccinated against yellow fever; three months after vaccination an acute illness developed accompanied by pain in the right upper quadrant and fever for five days. He had recurrent attacks of pain in the right upper quadrant. Exploratory laparotomy revealed an enlarged liver. Microscopic examination of a hepatic segment revealed periportal fibrosis and biliary duct proliferation, warranting diagnosis of portal cirrhosis of the liver. In the second patient there developed acute hepatitis three months after his induction into the air forces. There is no definite evidence that the patient received yellow fever vaccine. Exploratory laparotomy performed after three months of medical treatment revealed an enlarged, firm and granular liver. Microscopic examination revealed disturbance of the microscopic architecture and fibrosis, which were considered compatible with a diagnosis of portal cirrhosis. Persistence of jaundice in the third patient two months after gastrectomy and blood transfusions warranted exploratory laparotomy. The liver was enlarged, granular and firm. Jaundice increased postoperatively when adequate draining of bile through a T tube occurred, indicating that extrahepatic obstruction was not responsible for the jaundice. Fibrosis was not evident microscopically; but the periportal inflammatory process was severe and the microscopic picture was classified as cholangitis. In 2 cases the original disease was of the homologous serum type and in 1 case it was probably the epidemic form. Opinion that hepatic cirrhosis may be a sequela of acute hepatitis seems warranted.

Removing Fluorides from Water.—Maier states that optimal prophylactic effect of fluorides on caries is obtained within the range of 1 to 1.5 parts per million. Greater concentrations are associated with mottled enamel or dental fluorosis. More than five hundred communities in the United States are now using public water supplies containing in excess of 1.5 parts per million of fluorides. The author shows that most removal processes now available appear to be either too expensive to operate or too complicated for routine application. Current knowledge of the chemical processes involved is limited, and additional fundamental research in this field is needed. Further, the practical usefulness of the available methods and those now undeveloped must be tested on a pilot plant scale to determine their relative worth under varying conditions. Until this information is available, endemic fluorosis will continue to be a dental hazard in many communities in this country.

Tests in Diseases of Liver and Biliary Tract.—Neefe and associates analyzed responses of certain cephalin cholesterol flocculation, thymol turbidity, thymol flocculation and colloidal gold tests in diseases of the liver and biliary tract. The diagnostic value of the individual flocculation test varies with the disease concerned and with the purpose for which the test is used; that is, as an aid in differential diagnosis or as an aid in the detection of hepatic disturbance. For maximum assistance in the study of hepatic and biliary disease, regardless of the purpose for which the tests are used, the routine use of the cephalin cholesterol flocculation, thymol and colloidal gold tests as a group, at least in the initial study of such patients, offers more information than the use of any one or two of these tests. If all three tests cannot be used, the cephalin cholesterol flocculation and thymol reactions are the procedures of choice. None of these tests alone is reliable as a screening test or as a differential diagnostic aid. Further studies of the group response patterns in diseases of the liver and biliary tract are indicated.

Needle Biopsy of Liver.—For three and one-half years needle biopsy of the liver has been carried out at the Cincinnati General Hospital by Kumpe and his associates. One hundred and ninety-five biopsies have been performed on 170 patients. The "Vim"-Silverman needle was used in performing 186 biopsies, and the aspiration technic with the Iversen-Roholm needle in 9. Fourteen biopsies were made using the anterior subcostal approach over an enlarged right lobe and 1 over an enlarged left lobe of the liver. The other 180 biopsies were made by intercostal approach in the anterior or midaxillary line. All biopsies are performed at the bedside. No deaths have occurred in this series which could be attributed directly or indirectly to biopsy. In 11 cases the biopsy material was inadequate for diagnosis. Evaluation of diagnostic accuracy in 19 cases could not be determined because of lack of satisfactory proof of the clinical condition. In 85 cases biopsy diagnosis was in keeping with the clinical and laboratory data. In 41 cases the biopsy diagnosis was verified by necropsy or operation. In 8 cases the biopsy failed to reveal the presence of the hepatic lesion or the complete picture of the hepatic disease subsequently demonstrated at necropsy or operation. In 24 cases the results of biopsy of the liver changed an incorrect clinical diagnosis to a correct one. Since deaths have been reported by other observers following either needle or aspiration biopsy of the liver, caution should be exercised in the selection of cases and in the performance of the biopsy and the patient should be carefully observed following the procedure. The authors believe that final assessment of the safety and value of the procedure must await more widespread experience with it.

Electron Microscope in Diagnosis of Variola, Vaccinia and Varicella.--During the recent outbreak of smallpox in New York, Nagler and Rake collected specimens for electron microscopy from clinical cases of variola, generalized vaccinia and varicella. In summarizing their observations they stress that elementary bodies of variola and vaccinia that have been recovered from lesions of smallpox and generalized vaccinia in man can be demonstrated with the electron microscope. The latter resemble elementary bodies of vaccinia obtained from vesicular cutaneous lesions in an infected animal. Virus particles of variola and vaccinia recovered from human and animal tissues resemble each other closely in cell structure. They are also indistinguishable from elementary bodies of these viruses derived from the chorioallantois of the chick embryo. Elementary bodies can be demonstrated with the electron microscope in vesicle fluid or crusts from patients with varicella. They are predominately of rectangular shape and uniform in size but are scantier and smaller than bodies of variola and vaccinia. It is suggested that the electron microscope be used in clinical diagnosis of these diseases. If sufficient numbers of bodies can be measured, the electron micrographs might be used in the differential diagnosis between the first two diseases and the last. Bodies in vesicle fluid were scanty and gave an average measurement of 209 by 254 millimicrons. These facts would have suggested that the case was varicella, and, although there was some doubt in the minds of the clinicians whether the case was generalized vaccinia or varicella (since the rash developed six days after vaccination for smallpox), the weight of clinical opinion was strongly in favor of its being varicella.

Paracolon Bacillus Infection Causing Cholecystitis and Suppurative Hepatitis. K. Walton and J. C. Leedham-Green.—p. 1033.

Poliomyelitis: Symptomatology and Contact Histories.—McAlpine and his associates were able to confirm the diagnosis in 54 of 104 cases of poliomyelitis in patients who had been admitted to their clinic for early treatment. Twenty-four of the 54 patients had the nonparalytic form of poliomyelitis. Prodromal symptoms suggesting a systemic infection were present in 70 per cent of all cases. The symptoms were headache, a shivering feeling, malaise, a generalized muscular aching and fever. To these were sometimes added sore throat or coryza, or a gastrointestinal upset such as nausea, vomiting or diarrhea. The duration of this prodromal stage varied from fourteen days to a few hours. Headache was the main symptom of the meningeal stage of the disease. All degrees of stiffness of the neck were encountered. In a routine examination of the nervous system no abnormality may be detected beyond those mentioned. In other cases certain minor signs may be found which clearly indicate invasion of the central nervous system. The commonest of these signs is nystagmus. There were no deaths. Several case histories are given, including an example of a rare ocular complication (opsoclonia) as well as an unusual case of bulbar paralysis successfully treated by tracheotomy. In nearly one third of the proved cases contact histories suggested the probability of an abortive attack of the disease in other members of the family or in friends of the patient. The authors think that the virus of acute poliomyelitis should now be regarded as the usual cause of a benign type of lymphocytic meningitis and of a brainstem encephalitis accompanied by meningitis.

Flocculation Tests in Jaundice.—Rennie and Rae, to determine the value of two flocculation tests in jaundice, made observations on 110 patients with diseases of the liver, of whom 74 showed jaundice; on 100 controls drawn from donors of blood, and on 281 patients who suffered from a variety of conditions but showed no clinical evidence of hepatic disease. Both tests were carried out on the same sample of serum from each of the 491 subjects. In 100 controls both tests were negative. Of 270 patients without clinical evidence of hepatic disease, the cephalin test was positive in 7.8 per cent and the colloidal gold test in 9.6 per cent. Positive results with both tests were obtained in all conditions except diseases of the central nervous system and nephritis, but such results appeared to be most frequent in patients with acute infections (excluding rheumatoid arthritis). In persistent jaundice due to cirrhosis or subacute necrosis positive reactions were the rule and were helpful in differentiating the condition from obstructive jaundice. The gold test would appear to be the more satisfactory of the two procedures, since it is carried out with standard solutions of known chemical constitution.

*Vagotomy for Peptic Ulcer: Theoretic Background and Clinical Results. H. B. Wulff. -p. 265.

*Surgical Treatment of Polycystic Kidney. B. Köhler.

Vagotomy for Peptic Ulcer.--Wulff discusses the etiology and pathogenesis of peptic ulcers and the possibility of reducing excessive gastric secretion by bilateral vagotomy. Vagotomy, performed in 22 cases, confirmed results obtained by Dragstedt and other American surgeons. Eight to twelve months have elapsed since his patients were vagotomized, and the desired reduction in gastric secretion has been secured. Objective proof that the ulcer had healed has been obtained, and a distinct symptomatic improvement occurred in each case. The author believes vagotomy to be a promising treatment.

Polycystic Kidney.--Statistics cited by Köhler indicate that the incidence of polycystic disease of the kidney varies between 2 in 1,000 cases to 1 in 3,500 cases. The author believes the disease to be a malformation, often associated with other dysontogenetic changes. Contents of the cysts are formed through filtration into a still active glomerulotubular system. Patients are sometimes admitted to surgical departments because of complications of polycystic kidney, such as pain, fever, hematuria or calculi. The concentration capacity of these kidneys is often maintained and the prognosis may be relatively good. Uremia with advanced polycystic disease of the kidney is characterized by little change in the general condition. Hypertension and retinopathy are not necessarily present. Hypochromic anemia may exist. Palpation of the kidneys is the decisive factor in establishing the diagnosis. Views differ with regard to the advisability of surgical treatment in uncomplicated cases of polycystic kidney. Surgical technic consists in exposing one or both kidneys and opening as many cysts as possible. This can be done by puncture, by excision of the cyst walls or by cauterization. Etching the cyst walls with various corrosives is done to prevent the formation of new cysts. A method of suturing the kidney to the scar in order to make the enlarging cyst accessible for further surgical intervention has also been described. These conservative operative technics were introduced about 1910 and are often referred to as Rovsing's operation. They should be performed in perinephritis and infected cysts, in large hemorrhages, in threatening uremia, in rapid deterioration of renal function and in rapidly increasing hypertension. To illustrate the results and the risks of the operation Köhler reports 3 cases from his own material. One case indicates that the immediate result of operation may be good. The other 2 cases, however, show that the development of the disease is influenced only temporarily.

Book Notices

Blood Derivatives and Substitutes: Preparation, Storage, Administration and Clinical Results Including a Discussion of Shock Etiology, Physiology, Pathology and Management. By Charles Stanley White, M.D., Sc.D., Chief of Surgery, Doctors Hospital, Washington, D. C., and Jacob Joseph Weinstein, B.S., M.D., Associate in Surgery, School of Medicine, George Washington University, Washington, D. C. Cloth. Price, $7.50. Pp. 484, with 190 illustrations. Williams & Wilkins Co., Mount Royal and Guilford Aves., Baltimore 2, 1947.

The use of blood and blood derivatives in medical practice is increasing. The intelligent application of existing knowledge and research into the value of blood substitutes during the war was a great contribution to medical science. Many lives in the armed forces were saved by human plasma and serum albumin. The advances gained by the fractionation of plasma have been documented and presented so that full value can be enjoyed by the civilian population. The authors have brought together in one textbook the pertinent literature necessary for the development and expansion of blood programs throughout the country. It will be interesting and informative for the general practitioner, the surgeon, the internist and the pathologist and will become an outstanding reference and guide for hospital administrators. The chemical and physiologic aspects of blood, plasma and plasma derivatives have been stressed; similarly, their preparation, storage and administration are described in detail. A section is devoted to an important discussion of shock. The text is clarified throughout by numerous charts and photographs.

The Oculorotary Muscles. By Richard G. Scobee, B.A., M.D., Instructor in Ophthalmology, Washington University School of Medicine, St. Louis. Cloth. Price, $8. Pp. 359, with 113 illustrations. The C. V. Mosby Co., 3207 Washington Blvd., St. Louis 3, 1947.

The book, as stated by the authors, is the outgrowth of a series of lectures given to graduate students in the field of ophthalmology. The chapters consist of those usually found in textbooks on ocular musculature with many quotations from well known authorities and copies of illustrations from other texts. Some original illustrations are either enlargements of those found in the writings of others or pictures of methods of patients seen by the author, all of which add little that is new. In the section on surgery of the eye muscles there are no illustrations. The omissions of medical treatment and orthoptic procedures are too numerous to be detailed. In the introduction the author stated: "There will be many who disagree with the ideas to be presented, but the majority who disagree will not have tried them and cannot, therefore, disagree from experience but only from theory." This statement with a perusal of the text is sufficient to show that the author gives little thought to methods which have been in use for twenty-five years or more and also to demonstrate his lack of knowledge of what is transpiring in his chosen field in other parts of the world. References are minute, and a short index is appended. The format is good.

An Atlas of Anatomy. By Regions: Upper Limb, Abdomen, Perineum, Pelvis, Lower Limb, Vertebrae, Vertebral Column, Thorax, Head and Neck. By J. C. Boileau Grant, M.C., M.B., Ch.B., Professor of Anatomy in the University of Toronto, Toronto. Second edition. Cloth. Price $10. Pp. 496, with 591 illustrations. The Williams and Wilkins Co., Mount Royal and Guilford Aves., Baltimore 2, 1947.

The second edition of this already valuable book contains more than two hundred new illustrations, with the addition of color to some of the old illustrations. New features include complete coverage of hernia, the common anomalies found in the dissecting room, illustrations of epiphyses of the limb bones and plates of the cranial nerves. More comparative contrast might have been used in some of the half tone illustrations, but this is not a serious defect. The line drawings seem to lack a sureness of execution, but this is the result of the method used in tracing to insure accuracy. The index is adequate. It is a good atlas.

The Practical Nurse. By Dorothy Deming, R.N. Cloth. Price, $3. Pp. 370. The Commonwealth Fund, 41 E. 57th St., New York 22: Oxford University Press, Amen House, Warwick Square, London, E. C. 4, 1947.

This well written book comes at a time that is most auspicious because of the discussions in speech and writings, much of which are unsound, of the nursing problem. It separates clearly the duties of the practical nurse as distinguished from the professional nurse, ward maids and orderlies. This is important because many persons discussing this subject today are apparently not familiar with the specific duties of any of these categories. The advantages, disadvantages and dangers are treated fairly and without favoritism or prejudice and are treated completely in the abstract. The book deals with the length of time required for training; the subjects to be covered; the uniform; the acceptance by hospital administrators and professional nurses. It describes the practical nurse; the duties; the future supply. The volume outlines the place of the practical nurse in the home, large hospital, small hospital, psychiatric hospital, industrial nursing, federal services and public health nursing. It stresses the importance of supervision by the hospital authorities and professional nurses. The book is well documented. The chapter references are sound and illuminating and cover the situation thoroughly. The construction of the chapters, covering various situations of nursing, is orderly. Altogether it is a splendid book and should find a proper place in the hands and on the bookshelves of all interested in this most important subject.

The Thematic Apperception Test: The Theory and Technique of Interpretation. By Silvan S. Tomkins, Ph.D. With the Collaboration of Elizabeth J. Tomkins, B.A. Fabrikoid. Price, $5. Pp. 297. Grune & Stratton, Inc., 381 Fourth Ave., New York 16, 1947.

The present volume represents a clear, concise, well written description of the method, aims, technic and conclusions drawn from the thematic apperception test. Although some work in this field was carried out by Francis Galton on himself as early as 1879, nothing of value was published until 1935 by Morgan and Murray. This book represents a further study and elaboration of the work of Morgan and Murray and as such has been extended, amplified and refined. Along with the Rorschach test, the thematic apperception test has proved of definite value in the diagnosis of personality. There is an excellent bibliography and an adequate index. The book is recommended to all those who are interested in personality study, particularly to psychologists and sociologists, who could well use this volume as a textbook for study and teaching.

Sistema neurovegetativo. Por Augusto Pi Suner, director del Instituto de medicina experimental de Caracas, Caracas. Fabrikoid. Pp. 817, with 173 illustrations. Union Tipografica editorial Hispano-Americana, Calzada de la Piedad núm. 238-F, México, D.F., 1947.

This work is one of the best examples of Latin-American typography that has come to view. The illustrations are excellent, the type attractive. The general make-up of the book commends favorable attention. The author, whose father was a famous medical teacher of Barcelona, has made a notable contribution to Spanish medical literature. One is impressed that the book is scientifically up-to-date, authoritative and complete. Like many French and Spanish publications the references, though numerous, are by name and year only, without statement of the source. More than two thousand authors are referred to in the text. Readers of Spanish will find the text clearly and attractively written.

Fisiopatologia della circolazione venosa. Di Luigi Condorelli. Collana di scienze mediche 2. Boards. Price, 1200 lire. Pp. 337, with 83 illustrations. Casa editrice A. P. E. (Azienda poligrafica editoriale) degli Editori U. & G. Pagnano, Corso Italia, 23, Catania, 1947.

This monographic study is on venous circulation which has been the subject of previous publications by the author and his pupils. After describing a new apparatus for continuous recording of the venous pressure in man, the author applies the results of the method to the interpretation of many circulatory conditions. New conceptions are advanced. Some of these conceptions, such as those concerning a venous hypertonus (so-called active venous hypertension) are attractive, but few appear to be substantiated by solid evidence. Bibliographic quotations are mostly limited to French and German papers of the last ten years. The style and the composition of the book are far from being clear.

Queries and Minor Notes

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any official bodies unless specifically stated in the reply. Anonymous communications and queries on postal cards will not be noticed. Every letter must contain the writer's name and address, but these will be omitted on request.

TETANUS TOXOID

To the Editor:—In recent years I have inclined to the practice of giving patients with minor injuries an injection of tetanus toxoid instead of giving tetanus antitoxin. Recently I have used fluid toxoid exclusively, hoping to speed up the early development of immunity. Is there a record of cases of tetanus having occurred after such administration because of immunity not having had time to develop? Is this danger materially greater than the danger of a serious reaction to the horse serum of tetanus antitoxin assuming that the serum is withheld from patients known to be serum sensitive? I refer to the risk incurred from routine use of the 1,500 unit package of tetanus antitoxin. Would administration of penicillin, say daily injections of 300,000 units in oil and wax for the first three to four days, delay the growth of tetanus bacilli sufficiently to enable the body to respond to tetanus toxoid injected immediately after the injury? Eventually I believe the entire population should be given tetanus immunization as part of the infancy series and that thereafter a dose of the toxoid will be an accepted procedure when an injury brings the patient to the physician.

Henry L. Skinner, M.D., Battle Ground, Wash.

Answer.—If a person has been actively immunized with tetanus toxoid, protection from tetanus may be expected to endure for about two years. Thereafter immunity may be maintained by injection of a small dose of tetanus toxoid annually. Under the foregoing circumstances, if an injury occurred and the possibility of tetanus infection was feared, an immediate injection of tetanus toxoid instead of tetanus antitoxin would be indicated. However, if the patient had not been actively immunized, a single injection of tetanus toxoid would not be regarded as a reliable preventive. Therefore it would be proper to inject tetanus antitoxin. There is no reason why tetanus could not occur following a single injection of tetanus toxoid, because there would not be sufficient time for the required amount of antibodies to develop before the disease was well established. It has been reported that a stimulating, or booster, dose of tetanus toxoid will result in greater production of antibodies within a given time than can be supplied by passive immunization with 1,500 units of tetanus antitoxin. If it is known that a patient is sensitive to horse serum and it is considered that tetanus antitoxin should be administered, bovine tetanus antitoxin should be used; in any event, before injecting tetanus antitoxin a sensitivity test should be made.

If daily doses of penicillin are administered immediately after an injury, the growth of tetanus bacilli may be retarded. Consequently, by the administration of tetanus toxoid to a patient, the chances of protection may be improved, for a reservoir of antibodies is being established as a result of the immunizing agent. It is now an established practice with some pediatricians to administer tetanus toxoid either alone or in combination with other immunization agents to all infants or children and to inject a small booster dose of tetanus toxoid every year or two.

VARICOSE ULCERS

To the Editor:—What is the treatment of ulcerations of the leg occurring in patients who have had a bilateral ligation of the common femoral vein for pulmonary embolism? Ulcerations occurred about one year following ligation. Dependent edema is present, without visible varicosities. The ulcers occurred spontaneously, are perfectly round (punched out) and very superficial. They have not responded to the usual method for treatment of "varicose ulcers." One patient has a hyperhidrosis of the affected limb. Is sympathectomy indicated to release spastic influences? The Wassermann test is negative.

M.D., New York.

Answer.—Post-thrombotic indurations followed by ulceration do occur after ligations of the femoral veins, especially if the common femoral vein has been tied. Short periods of rest in bed with elevation of the limb, followed by application of glycerin-gelatin casts, often help but recurrences are frequent. Excision of the ulcer with its collar of induration is the next procedure, the defect being covered with a split thickness skin graft. The edema must be controlled with well fitting elastic hose or rubber bandage. If there is evidence of increased sympathetic activity in the affected limb, as manifested by hyperhidrosis or diminished pulsation and temperature, a lumbar sympathectomy is beneficial. No matter what procedure is used, continuous elastic support is important and may have to be worn for many years.

SPLINTER HEMORRHAGES

To the Editor:—A colleague (aged 35) has noted splinter hemorrhages of all his finger nails almost continuously for seven or eight years without other untoward symptoms. Except for roentgen examination of the chest, red blood cell count, white blood cell count, differential count and sedimentation rate, all within normal limits, he has not had laboratory tests. Familial hemorrhagic history, drug addiction and rheumatic history are absent. Physical examination, which he performed, disclosed two to three nontender lymph nodes 1 cm. in diameter in each epitrochlear region.

What are the possibilities in this case? Have cases of so-called "benign" splinter hemorrhages been reported?

M.D., California.

Answer.—The nature of the hemorrhages in the nail beds is not clear. In the absence of hemorrhages elsewhere in the skin, mucous membrane or toe nails, the possibility of trauma or local irritation rather than a systemic disease must be considered. No known cases of "benign splinter hemorrhages" are reported in the available literature. Additional tests of interest would be the platelet number, degree of capillary fragility, bleeding, clotting and prothrombin times and evidences of sensitivity (allergy).

RECALCITRANT PUSTULAR ERUPTIONS

To the Editor:—A white woman aged 46 has had an eruption on both feet since 1940. The eruption appears in crops of small-sized pinhead papules, which crust almost immediately after forming and in some cases enlarge to form flat pustules about the size of a matchhead. The lesions are mostly present on the plantar surface of the foot extending up on the lateral aspects and cause intense itching. Lesions between the toes are absent. This patient has been to every dermatologist in this vicinity and has received permanganate soaks, ultraviolet and roentgen therapy, phenol and glycerin, ointment of benzoic and salicylic acid and numerous other forms of treatment. She is now using "sopronol" (sodium propionate) powder and ointment and is having her feet painted twice weekly with "fluid salicresin" (a fungicidal preparation containing salicylic acid 2 per cent, benzoic acid 2 per cent, secondary amyltricresols 0.1 per cent, orthohydroxyphenylmercuric chloride 0.1 per cent and isopropyl alcohol 60 per cent, Upjohn). She had a four day course of penicillin and has been using "benadryl" for about three weeks without amelioration of symptoms. Opening the pustules has not prevented new ones from forming. The feet start to clear up temporarily, but then suddenly relapse with renewed pruritus. What is the diagnosis and treatment?

M.D., Kansas.

Answer.—Consideration of the location, the chronicity and the pustular element of the dermatosis indicate that it belongs in the category of what is called recalcitrant pustular eruptions of the hands and feet. The several diseases included in this term are acrodermatitis continua (Hallopeau), pustular psoriasis of the extremities and pustular bacterid described by Andrews. These diseases have common characteristics and have not been definitely established as separate entities.

Features of these diseases are their location on the hands and feet, unilateral or bilateral, a rather sharply marginated patch with some degree of inflammation and closely adherent, dry scales. A predominant feature is pustulation, the pustules are rather deep seated, at first the size of pinheads but later larger. These diseases usually occur in adults; itching may be present. They are further characterized by their chronicity, exacerbations and resistance to treatment.

Acrodermatitis continua, also called acrodermatitis perstans and dermatitis repens, is more likely to appear on the extremity of a digit and coexist with paronychia. Staphylococcus aureus may be recovered from the pustule. Pustular psoriasis and pustular bacterid are more likely to occur on the palms or soles. The pustules as a rule are sterile.

In treatment search for and removal of foci of infection are important. The application of penicillin ointment locally is of value. Response has been reported following administration of sulfadiazine and also sulfapyridine. Measures to improve the patient's general health are indicated. The local use of diluted aluminum acetate (1:20) in the form of a wet dressing or in ointment base and daily painting with 10 per cent solution of potassium permanganate are recommended.

GENTIAN VIOLET IN PREGNANCY

To the Editor:—A woman, aged 27, three months pregnant, was treated with gentian violet for Oxyuris vermicularis. After taking two ½ grain (30 mg.) tablets three times a day for six days a spontaneous abortion occurred. Is there a connection between the medication and the abortion?

Walter Freund, M.D., Oswego, N. Y.

Answer.—Gentian violet medicinal taken internally in large doses has a definitely toxic effect. Amounts about eight times that given to this patient were necessary to kill experimental dogs. The dosage given this patient was well within therapeutic limits.

Whether the gentian violet taken by this patient could have had any effect in producing the abortion must remain entirely speculative. Probably the abortion was entirely coincidental and not the result of the medication.

MANAGEMENT OF RECURRENT RENAL CALCULI

COL. JAMES C. KIMBROUGH, M. C.
Chief, Urology Section, Surgical Service, Walter Reed General Hospital
and
MAJOR JOHN N. FURST, M. C.
Resident in Urology, Walter Reed General Hospital
Washington, D. C.

This paper presents the management of recurrent renal calculi in patients observed at Walter Reed General Hospital during the one year period April 1, 1946 to April 1, 1947. During this period, 13,977 patients were admitted to Walter Reed General Hospital; of these, 793 were treated in the surgical service of the urology section.

Only the patients treated by operative procedures are included herein. A large number were treated by measures other than operative—spontaneous passage, attempts at dissolution and manipulative procedures. Many of these were treated on the sections of neurology (patients with paraplegia) and orthopedic surgery (amputees). There were more than 1,500 cases of paraplegia resulting from battle casualties of World War II, 90 per cent of which were complicated by neurogenic conditions of the bladder. There were more than 15,000 amputees. The periods of hospitalization and recumbency resulted in a high percentage of complicating and recurrent renal calculi. Accurate statistics concerning the incidence of calculi in these patients are not available at present, but will be in the near future.

The magnitude of the treatment of calculi in these patients can be appreciated when the long periods of recumbency are considered. Many of them have experienced repeated manipulation and operation. The calculi are often bilateral, and the conservation of renal tissue is imperative.

The causation of renal calculi has been adequately presented in recent years by Randall,[1] Keyser,[2] Flocks,[3] Vermooten[4] and others. The incidence has been reported by Higgins,[5] Cabot and Crabtree. Flocks has dealt extensively with methods of prevention. The dissolution and manipulative treatment has been considered by Higgins, Councill,[6] Ferguson,[7] Balkus,[8] Browne[9] and others. Operative procedures have been thoroughly described by Priestley,[10] Bugbee[11] and Yunck and Forsythe.[12] Lowsley and Menning's[13] work on repair of renal lesions is outstanding. Bugbee's description of secondary renal operations has been a guide for the procedures for treatment in the cases herein reported.

The incidence of recurring renal calculi has been reported within a wide range variation. Cabot and Crabtree (cited by Higgins[5]) reported an incidence of 56 per cent recurrence following nephrolithotomy and 51 per cent following *pyelolithotomy*. Fifteen to 30 per cent recurrence is not unusual. Higgins, with his rigid management, reduced the incidence in his series to 4.7 per cent.

Fourteen of the 25 patients included in this report had previous operations for the removal of calculi, an incidence of 56 per cent. This in no measure indicates the general incidence of recurrence in Army hospitals, since it does not consider the patients from whom stones are removed by operation and manipulation or passed spontaneously and who are not followed up after such treatment.

So-called recurrence may be due to incomplete removal of all calculi at operation. This error can be eliminated by roentgenologic examination at operation and adequate postoperative follow-up. It is possible that some of the reported early recurrence was due to incomplete operation.

Because of the large number of patients in Army hospitals who require prolonged treatment as bed patients, recumbency with attendant urinary stasis becomes a major causative factor. Patients with paraplegia and with complicating neurogenic conditions of the bladder are a special problem. These patients have had urethral or suprapubic drainage; even when drainage is no longer necessary, there is usually considerable residual urine. Almost all of them have infection of the urinary tract. The recumbency, stasis and infection cause a high incidence of renal calculi.

Read before the Section on Urology at the Ninety-Sixth Annual Session of the American Medical Association, Atlantic City, N. J., June 13, 1947.

Dr. Lloyd G. Lewis, Chief of the Urology Section, Walter Reed General Hospital (1942-1946), and Consultant in Urology to the Secretary of War, contributed materially in the management of the patients. Captain David K. Worgan, Captain Carl Denslow and Lieutenant Frederick T. Reuter, Residents in Urology, Walter Reed General Hospital, assisted in carrying out the treatment. Master Sergeant Ralph W. Green and Sergeant Nadine L. Drake assembled the material, compiled the case records and prepared the slides and photographs.

Local damage to renal tissue by infection, battle injury or operative procedure provides a fertile field for recurrence and has been an important factor. When persons with moderate obstruction at the ureteropelvic juncture or the infundibulum, who have no symptoms under normal living conditions, become bedridden, sufficient stasis is produced to become a factor in the formation of calculi.

Bacillus proteus has been the predominating bacterium in cases of recurrent disease, and reformation of calculi is almost certain to take place unless this organism is eradicated before or after operation. Urea-splitting staphylococcus is a frequent causative agent. Pseudomonas aeruginosa is often present. It has been difficult to evaluate the effect of this organism. The serum phosphorus and calcium have been normal in all cases.

The recurrent calculi are often of the branched type and conform to the shape of the calyx occupied. The stones are usually multiple and adhere to damaged renal tissue. The chemical composition is fairly uniform and consists predominantly of calcium and ammonium phosphate; magnesium and ammonium (NH_4) groups are usually present.

Preoperative roentgenologic studies, including excretory and retrograde urograms, will demonstrate the number, size and location of calculi and the associated renal pathologic changes. Such information is valuable in planning the operation before surgical exposure. Appropriate tests of renal function and examinations of the blood and the urine are essential in evaluating the general condition of the patient prior to treatment.

The removal of renal calculi is only an aspect in the management of the disease and may be misdirected effort unless there is appropriate postoperative care to prevent recurrence of the calculi and to maintain the general health of the patient.

Calculi in the kidney are foreign bodies, always cause damage and should be removed. Observation with appropriate roentgenologic studies may be carried out in patients without infection and obstruction; however, delay in removal may be disastrous. One cannot predict when infection will cause serious danger or when obstruction will convert the "silent" stone into one of grave emergency. Time should not be lost in awaiting spontaneous passage. Dissolution with various irrigating solutions has proved unsatisfactory. Manipulation with catheters, loops and other devices is often a dangerous procedure. Persistence and procrastination cease to be virtues when one employs nonoperative measures to remove urinary calculi.

During the one year period from April 1, 1946 to April 1, 1947, 25 patients were treated for renal calculus by operation. Twelve of these had one operation and 13 had one or more previous operations for renal calculi. Two had bilateral calculi removed. The calculi were removed from 8 (32 per cent) by pyelolithotomy, from 3 (12 per cent) by nephrolithotomy, from 7 (28 per cent) by nephropyelolithotomy, from 4 (16 per cent) by calyceal resection and from 3 (12 per cent) by nephrectomy.

Pyelolithotomy is the operation of choice, but it is rarely possible as a secondary operation. Nephrolithotomy may be employed in primary or secondary operation when the stone is readily accessible by incision through renal substance. Nephropyelolithotomy is used in cases in which nephrostomy drainage is required, because of infection or hydronephrosis, and is oftenest employed in secondary operation. Calyceal resection is used in cases in which the calculi are held in a calyceal cyst (primary operation) or in cases in which the calculi are retained in a damaged calyx (secondary operation). Nephrectomy (3 cases) was performed when the kidney was damaged beyond hope of salvage and the opposite kidney was in good condition. Measures to induce spontaneous passage, dissolution by dietary measures and irrigation and removal by various methods of manipulation have been futile in these complicated cases.

Operations for Renal Calculi (April 1, 1946 to April 1, 1947)

	Primary Operation	Secondary Operation	Total No.	Percentage
Pyelolithotomy	7	1	8	32
Nephrolithotomy	1	2	3	12
Nephropyelolithotomy	2	5	7	28
Calyceal resection	1	3	4	16
Nephrectomy	0	3	3	12
Total patients	11	14	25	100
Total operations (2 patients had two operations)			27	

Prior to operation, efforts have been made, often unsuccessfully, to eradicate infection. The organisms most frequently observed are B. proteus, staphylococci, Escherichia coli, Aerobacter aerogenes and Ps. aeruginosa. The infection can usually be eradicated with sulfonamide drugs and penicillin. Streptomycin has been employed in selected cases.

In patients who have had one or more operations, the incision usually removes the scar of the previous incision. The twelfth rib is resected when necessary, in order to obtain adequate exposure; subperiosteal resection is preferred. The peritoneum and the renal fascia are exposed. There are usually dense adhesions of the kidney to the adjacent tissue. Subcapsular exposure is carried out by making an incision through the renal fascia (fascia of Gerota) and the renal capsule, and the kidney is delivered through the capsular incision. The capsule at the pedicle is incised with a knife or dissected with scissors, exposing the renal vessels, and the pelvis is isolated. Rubber-covered curved hemostat clamps are placed about the pedicle to assure control of hemorrhage. The necessary nephrotomy incision or calyceal resection is carried out, and the calculi are removed. Calyceal resection is done in cases in which the renal tissue is damaged and cortical stones are present. Injured renal tissue is a fertile field for recurrence and must be removed along with the stones. The renal pelvis is examined, and obstruction of the ureteropelvic juncture is relieved. The pelvis is usually opened and the ureteropelvic juncture examined with a no. 12F bulb.

Nephrostomy drainage and a ureteral splint are usually employed. The nephrostomy incision or calyceal resection is closed with mattress or ribbon gut sutures through the tough fibrous capsule, and the hemorrhage is controlled by incorporating pads of fat or oxidized cellulose gauze. The fibrous capsule is closed about the renal tissue, leaving the kidney in its original position. A cigaret drain to the renal area is inserted, and the incision is closed with no. 1 chromic surgical gut, with figure-of-eight interrupted sutures. The skin is approximated with silk. Roentgenologic examination is carried out at the operation to ascertain the position of remaining calculi and to insure the complete removal of all fragments. Several years' experience with this procedure has emphasized the importance of simple apparatus. Complicated technics with special devices have been unsuccessful. In present practice, an 8 by 10 inch (about 20 by 25 cm.) cassette in a sterile container is placed just behind the renal area and the x-ray unit, covered with sterile drapes, is placed on the abdominal approach. Exposures are repeated until the roentgenograms indicate that all calculi have been removed.

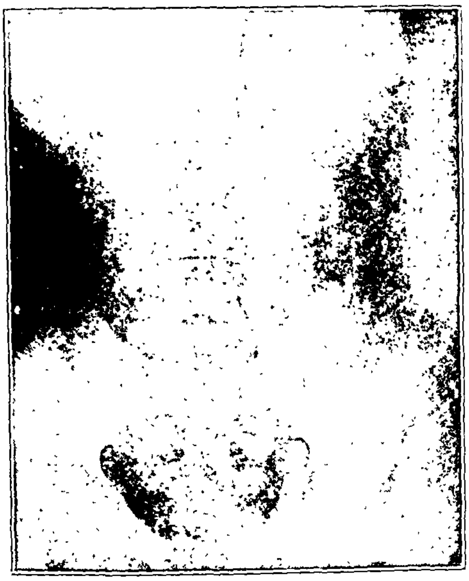

Fig. 1 (case 1).—Urogram made before the injection of the contrast medium, showing the calculus in the region of the left kidney prior to operation.

Immediate postoperative care is important. Irrigation with Suby's solution "*G*," a solution of citric acid, magnesium oxide and sodium carbonate of p_H 4, or "M," a variation of the solution with a p_H of 4.5, is begun on the second or third day. The cigaret perirenal drain is removed on the fifth or sixth day. During the fourth week, cultures are made and a urogram through a nephrostomy tube is carried out. The nephrostomy drain and the urethral splint are removed in the fourth or fifth week, when it is ascertained that the infection is cleared and that drainage is no longer necessary. The patient is usually up and about by the tenth day and able to leave the ward a few days after the drain is removed.

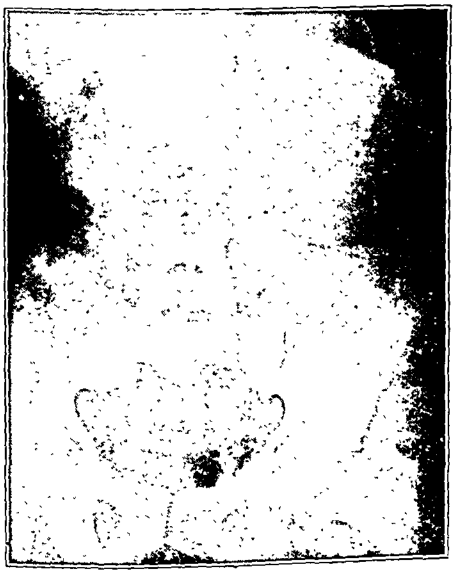

Fig. 2 (case 1).—Excretory urogram made five minutes prior to operation, showing the absence of shadow in the left kidney.

The pleura was opened in 2 patients. With modern anesthesia, this accident causes little apprehension. The pleural rent is closed with mattress sutures to the costal margin, and the pneumothorax is given adequate attention. Convalescence was not complicated by such accidents.

The peritoneum was opened in 3 patients. These accidents not only caused no complications but gave opportunity for more adequate examination and exposure before closure of the peritoneum. The essential points of operation are as follows:

1. Adequate exposure
    - Removal of rib
    - Subcapsular approach
2. Avoid damage to renal tissue
3. Control hemorrhage
    - Pedicle clamps
    - Oxidized cellulose
    - Fat pads
    - Ribbon or mattress sutures
4. Resection of damaged renal tissue (calyceal resection, wedge incision, capsule cover)
5. Relieve ureteropelvic obstruction
6. Avoid injury to adjacent structures
    - Pleura
    - Peritoneum
7. Ascertain that all particles of stone have been removed
    - Roentgenogram at operation
8. Adequate postoperative drainage and irrigation
    - Nephrostomy drains
    - Ureteral splints
    - Solutions "M" and "G"

Postoperative hemorrhage occurred in 1 patient on the ninth day and continued in alarming degree for three days. The hemorrhage ceased spontaneously on the third day, at which time nephrectomy was being seriously considered.

Infection often recurs following the operation. Sulfadiazine, 4 Gm., and penicillin, 600,000 units in oil, are given daily during the postoperative course. Streptomycin is used in selected cases.

The treatment after operation is designed to prevent the recurrence of calculi and to carry out measures to maintain the general health of the patient. The patient who has had treatment for renal calculi presents an optimal case for recurrence in that he has the potential, local and constitutional diathesis for the formation of stone.

When the physician has removed the causes of obstruction and has eradicated infection, it devolves on the patient to regulate his diet and maintain a proper intake of fluid to insure against recurrence.

The maintenance of mobility and the avoidance of the lethargy of recumbency is important, the responsibility of which often devolves on the patient.

The regimen for the prevention of recurrence may be summarized as follows:

1. Maintain intake of fluid at minimum of 3,000 cc. daily
2. Avoid urinary stasis
    - Movement of patient
    - Correction of obstruction at operation
    - Provide adequate drainage
    - Maintain adequate fluid intake
3. Eradicate infection
    - Intake of fluid
    - Chemotherapy
    - Correct stasis
4. Dietary measures
    - Acid ash
    - High content of vitamins A and B
    - Limit intake of calcium
5. Adequate postoperative examination
    - Urine cultures
    - Roentgenograms: excretory and retrograde urograms

Roentgenologic follow-up should be carried out at three month intervals, in order to note early recurrence.

REPORT OF CASES

CASE 1.—W. T. F., a white man aged 54, was admitted to the hospital on Jan. 22, 1947, with acute colic of the left kidney. A roentgenogram on admission showed a shadow in the region of the left kidney, 2 by 3 cm. in diameter.

Previous History.—Operation for removal of a calculus from the left kidney was performed in 1936 and again in 1938. He remained free of symptoms from 1938 until July 1946. Gross hematuria developed in July, but subsided in a few days. He experienced pain in the left renal region in September.

Physical Examination.—Physical examination disclosed a well nourished well developed man. His blood pressure was 110 systolic and 80 diastolic. There was a scar in the left lumbar region.

Roentgenographic Data.—An excretory urogram, made on Jan. 3, 1947, revealed the right kidney to be normal. Severe hydronephrosis on the left side and obstruction at the ureteropelvic juncture were present. An area of density, 1 by 2 cm., was seen in the roentgenogram. Observations were confirmed by a retrograde urogram February 8 The chest was normal.

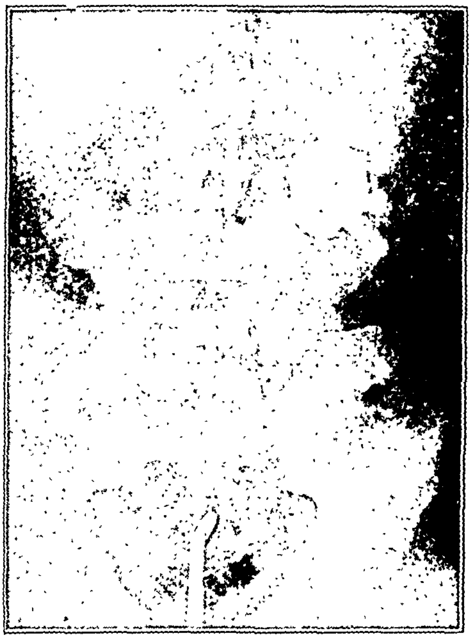

Fig. 3 (case 1).—Retrograde urogram prior to operation.

Laboratory Data.—Urinalysis revealed a specific gravity of 1.205 and a trace of albumin. Culture yielded A. aerogenes. Examination of the blood showed urea nitrogen, 8.6 mg., and sugar, 116 mg. per hundred cubic centimeters. Serum calcium was 10 mg. and serum phosphorus 4 mg. per hundred cubic centimeters.

Progress in Hospital.—Prior to operation the patient was treated with penicillin, 600,000 units in peanut oil daily, and 4 Gm. of sulfadiazine for five days.

Operation (January 25).—Nephropyelolithotomy was performed on the left side. A curved lumbar incision was made (left), removing the scar of the previous incision. The twelfth rib was resected subperiosteally. The kidney was densely adherent to the peritoneum and adjacent structures. Subcapsular delivery was accomplished. The pelvis was isolated, and an incision, 2.5 cm. in length, was made posteriorly. The pelvis was thick and fibrotic. The ureteropelvic juncture was moderately obstructed. A calculus of 1 by 2 cm. was removed from the pelvis. The ureteropelvic juncture was dilated. A nephrostomy drain with a ureteral splint was introduced through the middle calyx. The incision of the pelvis was closed, and the kidney was returned to its original position and the capsule sutured over the kidney. The wound was closed with no. 1 chromic surgical gut, with interrupted sutures. Roentgenographic examination was carried out at the operation to verify the fact that all stones had been removed.

Postoperative Course.—The postoperative course was uneventful. The nephrostomy drain was removed in three weeks. The patient was on sick leave for four weeks and returned to duty in eight weeks.

Remarks.—At the time of the patient's discharge from the hospital, the hydronephrosis was reduced in size and the obstruction at the ureteropelvic juncture was apparently relieved.

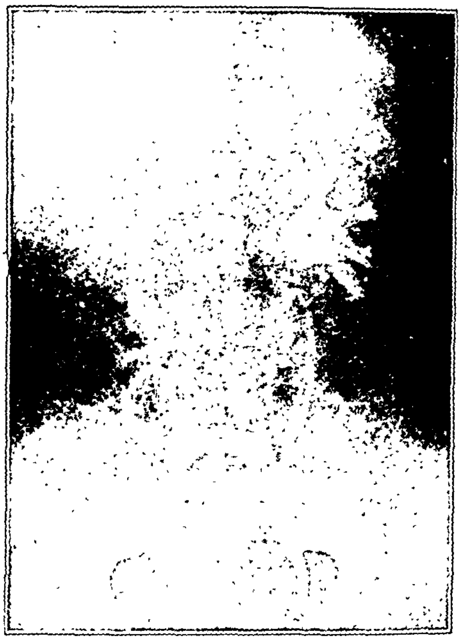

Fig. 4 (case 1).—Postoperative urogram. A radiopaque medium was injected through a nephrostomy tube.

CASE 2.—S. L. B., a white man aged 45, was admitted to the hospital Nov. 27, 1946, with hydronephrosis and a calculus in the left kidney, which had been observed at the separation center.

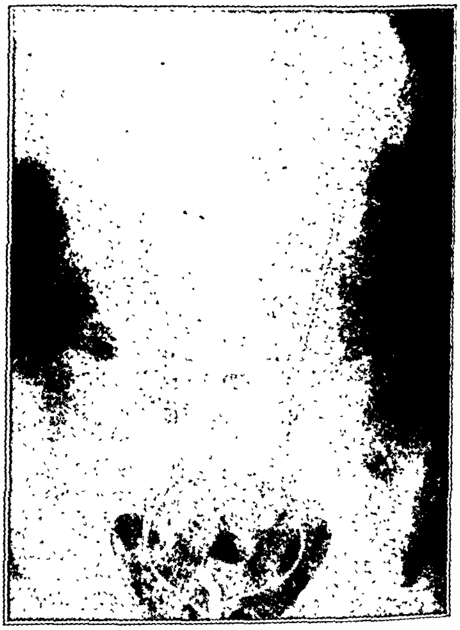

Fig. 5 (case 2).—Urogram made before operation, showing the calculus in the left kidney.

Previous History.—Nephrotomy for the removal of renal calculus was performed in June 1945. The patient complained of nagging pain in a costovertebral angle on the left side since that time.

Physical Examination.—No abnormalities were observed except for mild sensitivity in the left flank. There was a healed scar on the left flank. His blood pressure was 118 systolic and 70 diastolic.

Roentgenograms.—Excretory and retrograde urograms demonstrated hydronephrosis on the left side. The roentgenogram showed an area of density, 1 cm. in diameter, in the inferior calyx of the left kidney. There was moderate obstruction at the ureteropelvic juncture. The right kidney was normal, and no significant thoracic observations were made.

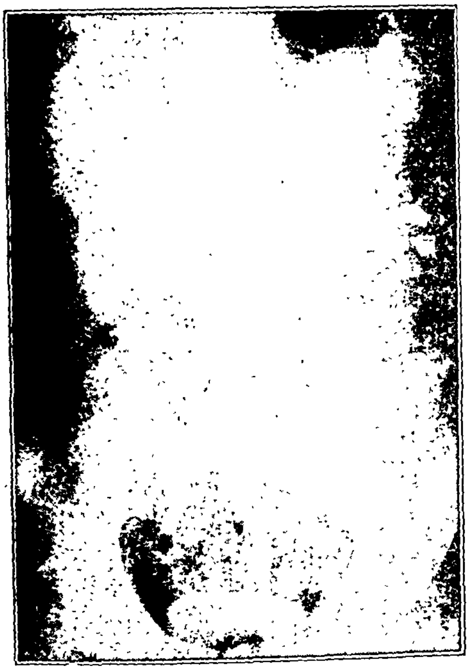

Fig. 6 (case 2).—Retrograde urogram showing the calculus in the inferior hydrocalyx.

Laboratory Observations.—Urinalysis revealed a specific gravity of 1.026. There was no trace of albumin or sugar, and microscopic observations were normal. The reaction to the Kahn serologic test for syphilis was negative. Studies of the chemistry of the blood showed urea nitrogen, 14 mg., and sugar, 133 mg. per hundred cubic centimeters. Other aspects of the blood were normal. B. proteus was cultured from the urine, from the bladder and from the left kidney. On cystoscopic examination, the p_H of the urine from the right kidney was 5.4 and from the left kidney it was 7.2. Serum phosphorus was 3.2 mg. and serum calcium 11.25 mg. per hundred cubic centimeters.

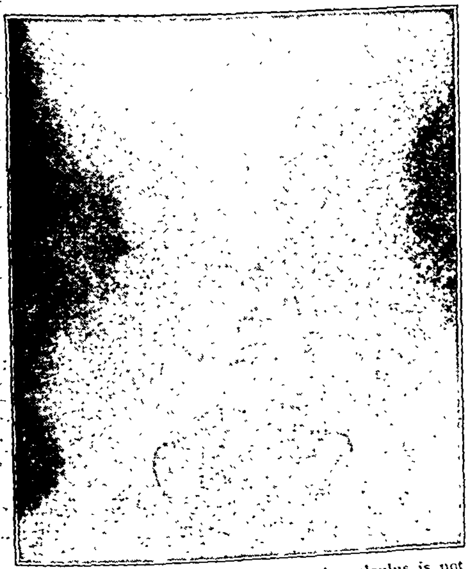

Fig. 7 (case 2).—Postoperative urogram; the calculus is not present.

Progress in Hospital.—Preoperative treatment was with penicillin and sulfadiazine (chemotherapy), to eradicate the renal infection.

Operation.—A nephropyelolithotomy of the left kidney and the left ureter was done on Dec. 3, 1946. A curved lumbar incision was made, removing the scar of the previous operation. The twelfth rib was removed, and the peritoneum and renal fascia were exposed. There were dense adhesions of the kidney to the adjacent structures. The kidney was exposed by subcapsular incision, and the pelvis was isolated. The pelvis was moderately enlarged, and there was obstruction at the ureteropelvic juncture by anomalous vessels and bands. Incision was made at the posterior aspect of the pelvis, and a calculus was removed from the lower calyx. A nephrostomy drain and a ureteral catheter splint were introduced. The kidney was replaced in its normal position, and the capsule was approximated about the renal tissue. The wound was closed with an interrupted figure-of-eight suture. A cigaret drain to the renal pelvis was inserted. The postoperative course was uneventful. The cigaret drain was removed on the sixth day, and the nephrostomy drain and the ureteral catheter splint were removed on the twenty-first day. The patient left the hospital at the end of the fourth week and returned to duty without disability.

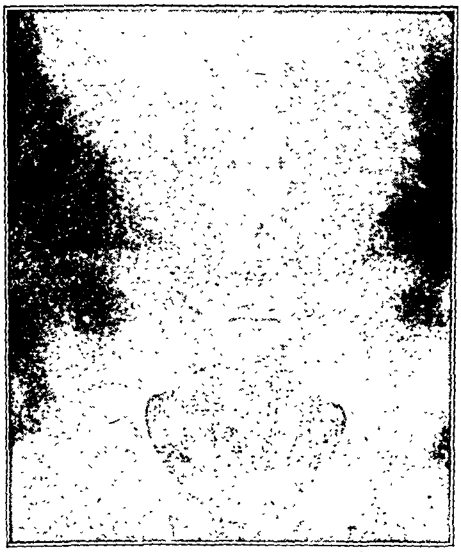

Fig. 8 (case 2).—Postoperative excretory urogram; hydronephrosis persists.

Remarks.—Chemical analysis of the renal calculus revealed phosphates, calcium oxalate, magnesium and chemicals of the ammonium (NH_4) group. Roentgenologic examination was carried out at the time of operation to verify the fact that all the stones had been removed.

Case 3.—G. S., a white man aged 28, was admitted to the hospital with a history of the onset of bilateral renal colic in 1941. There was spontaneous passage of a calculus in the left kidney. Spontaneous passage of calculi in both kidneys occurred in 1942 and again in 1944. A calculus was removed from the right kidney by operation in 1945. His previous history was not remarkable.

Physical Examination.—Physical examination disclosed tenderness over the right kidney. His blood pressure was 120 systolic and 90 diastolic.

Roentgenograms.—A retrograde urogram showed seven fairly large calculi in the right kidney, in the superior and inferior calyces and in the pelvis. There was moderate hydronephrosis. The left kidney appeared normal. The chest was also normal.

Laboratory Observations.—The urine had a specific gravity of 1.016. There was a trace of albumin, but no sugar. Ps. aeruginosa and B. proteus were cultured from the urine. Urea nitrogen in the blood was 15 mg., serum phosphorus 3.7 mg. and serum calcium 10.5 mg. per hundred cubic centimeters. The remaining observations of the blood were within normal range. The Kahn serologic reaction was negative.

Progress in Hospital.—The patient was treated preoperatively with penicillin and sulfonamide drugs for ten days, to eliminate the renal infection. On Jan. 27, 1947, a nephrolithotomy of the right subcapsular region was performed. A curved lumbar incision, 20 cm. in length, was made, removing the scar of the previous operation and exposing the renal fascia. The twelfth rib was removed. The kidney was densely adherent to the adjacent structure. The incision was made through the renal fascia and the capsule of the kidney. Subcapsular exposure was carried out. A rubber-covered clamp was applied to the pedicle to control hemorrhage. Nephrotomy incisions were made in the superior and inferior poles, and the calculi were removed. Oxidized cellulose gauze was placed in the nephrotomy incisions, and closure was accomplished with mattress sutures through the kidney, renal fascia and capsule. A nephrostomy drain through the inferior calyx and a ureteral catheter splint were placed in position. A cigaret drain to the renal fossa was inserted. The postoperative course was uneventful. The cigaret drain was removed on the seventh day. The nephrostomy drain and the ureteral catheter splint were removed on the twenty-first day. The wound healed, and the patient was able to leave the hospital during the fifth week. Chemical analysis of the stones showed calcium phosphates, oxalates and ammonia.

Remarks.—Roentgenologic examination was carried out at operation to verify the fact that all stones had been removed.

CASE 4.—O. K. M., a white woman aged 53, had an operation for the removal of stones in the region of the left kidney in September 1945. She experienced sudden severe pain in July 1946, after a long automobile ride. Stones were observed in the left kidney in August. Her previous history was noncontributory.

Physical Examination.—Observations in the physical examination were not remarkable. Her blood pressure was 118 systolic and 70 diastolic.

Roentgenologic Data.—The chest was normal. A retrograde urogram showed a normal right kidney, moderate hydronephrosis, two large laminated calculi in the left kidney and ureteral constriction at the ureteropelvic juncture.

Laboratory Data.—There was no albumin or sugar in the urine. Observations of the blood were not remarkable. The Kahn serologic reaction was negative. The blood urea nitrogen was 16 mg. and sugar 97 mg. per hundred cubic centimeters. The serum phosphorus was 4.4 mg. and serum calcium 12.6 mg. per hundred cubic centimeters. E. coli and Ps. aeruginosa were cultured from the urine. In the test of renal function with phenolsulfonphthalein the results were: appearance time five minutes, 60 per cent in thirty minutes and 20 per cent in one hour, for a total of 80 per cent. Cystoscopy revealed a *p*H of 5.5 in the right kidney and 7.6 in the left kidney.

Operation.—A nephropyelolithotomy was performed December 5. A curved lumbar incision, 20 cm. in length, was made, beginning above the level of the twelfth rib, 5 cm. lateral to the spine and extending downward and forward. The scar of the previous operation was removed. The kidney was densely adherent to the peritoneum and the adjacent structure. The incision was made through the renal fascia and the capsule, and the kidney was exposed subcapsularly. Hemorrhage was controlled with a rubber-covered clamp to the pedicle. A nephrotomy and a pelvic incision were made, and two large calculi were removed. A no. 12 bulb was passed through the ureteropelvic juncture to estimate the degree of ureteral obstruction. Anomalous vessels and bands were removed at the ureteropelvic juncture. A de Pezzer catheter with a ureteral splint was introduced through the lower calyx. The kidney was placed into original position with triangular sutures at the posterior surface. A cigaret drain to the renal area was inserted. The wound was closed with no. 1 chromic surgical gut, with interrupted sutures. Roentgenologic examination was used at operation to verify the complete removal of the calculi. The postoperative course was uneventful. The cigaret drain was removed on the sixth day, and the nephrostomy drain and ureteral splint were removed after two weeks. The patient was discharged from the hospital on the twenty-first day after operation.

Remarks.—The patient was treated with sulfadiazine and penicillin postoperatively, to limit infection. Roentgenologic examination was carried out at operation to verify the fact that all stones had been removed.

CASE 5.—S. E. R., a white man aged 41, was admitted to the hospital, with a history of the onset of his present illness on July 18, 1944, when he passed three small stones from the bladder without pain. A roentgenogram on July 22 showed calculi of the left kidney. On August 4, a nephrolithotomy was performed, with the removal of a large number of calculi from the left kidney. On Aug. 31, 1945, a roentgenogram showed the recurrence of calculi in the left kidney. Gross hematuria developed on March 14, 1946, with colic in the left kidney and fever. Several small stones were passed. On November 18, a roentgenogram showed multiple calculi of the left kidney. The patient was transferred to Walter Reed General Hospital December 9.

Physical Examination.—Observations in the physical examination were not remarkable.

Roentgenologic Data.—The chest was normal. An excretory urogram indicated a large group of stones, 2 cm. in diameter, in the lower pole of the left kidney, just distal to and included in the caudal calyx. There was moderate hydronephrosis, and the superior and middle calyces were clubbed. The right kidney was normal.

Laboratory Observations.—Urinalysis revealed a specific gravity of 1.017 and no trace of albumin or sugar. Observations of the blood were not remarkable. The blood urea nitrogen was 12 mg. per hundred cubic centimeters. The Kahn serologic reaction was negative. Culture yielded Ps. aeruginosa and A. aerogenes. Tests for sensitivity to streptomycin were carried out. The serum calcium and serum phosphorus were within normal range.

Progress in Hospital.—The patient was treated with streptomycin until the urine culture was negative.

Operation (Jan. 14, 1947).—Because the patient had had two previous operations for the removal of calculi from the lower calyx and because the calculi involved the renal tissue of the lower pole, subcapsular resection of the calyces was planned. The kidney was exposed through a curved lumbar incision; the capsule was divided, and the lower calyx was resected and the calculi removed. Hemorrhage was controlled by suturing the large vessel and approximating the renal tissue over oxidized cellulose gauze, with mattress sutures through the tough capsule. A nephrostomy drain was inserted and the wound closed. The postoperative course was uneventful. Irrigation through the nephrostomy tube with solution "G" was begun on the third day. The nephrostomy drain was removed at the end of the third week, after roentgenograms and a urogram showed that the stone was absent and the condition of the renal pelvis was good. The infection recurred during the fourth week and was cleared again with streptomycin. The patient's recovery was uneventful, and he was discharged from the hospital in the fifth week after operation.

Remarks.—Because multiple small calculi were incorporated in the renal tissue, it is believed that removal of these stones, leaving a damaged kidney, would have been followed by recurrence of the calculi. Roentgenologic examination was carried out at the operation to verify the fact that all stones had been removed.

SUMMARY AND CONCLUSIONS

The incidence, causation and treatment of recurrent renal calculi, complicating recumbency of patients with war wounds, is discussed, and the operative technic is described. On account of previous renal operation, the kidneys in patients with renal calculi are adherent to the adjacent structure, making exposure difficult. The subcapsular approach reduces to a minimum the

damage to the kidney and adjacent organs and is the operative procedure of choice in these cases.

Reports of cases are included. Postoperative follow-up is emphasized.

The operative treatment of renal calculi is but a phase in the management of this disease, and the proper postoperative regimen is essential for the prevention of recurrence.

ANALYSIS OF TWO HUNDRED CASES OF URINARY CALCULI

With Particular Reference to Methods of Management of Ureteral Stones

HAMILTON W. McKAY, M.D
H. HAYNES BAIRD, M.D.
and
KENNETH LYNCH JR., M.D.
CHARLOTTE, N. C.

In this paper no attempt has been made to review the literature, because such a review would not be in keeping with the title nor would time permit.

In 200 patients with urinary calculi there were seventy-seven renal stones, twenty in the upper part of the ureter, eleven in the middle part of the ureter, ninety in the lower part of the ureter and ten in the bladder; there were 4 patients with bilateral ureteral calculi and 12 with bilateral renal calculi.[1] The mortality rate was 0.5 per cent. This classification is based on the fact that the stones were located at the anatomic positions mentioned when we had to offer a solution to the patient's problem. It is obvious that many of these stones had previously been located at other points in the urinary tract.

The accompanying table offers the most practical solution to the problem of presenting a concise analysis of the ureteral stones in this series of cases.

Analysis of Cases

Location of Stones	Average Hospital Stay, Days	Percentage of Cases	Percentage of Morbidity (Chills and Fever)
Upper part of ureter (20 cases)			
Operative	17	70	57
Operative cystoscopy *	9	30	33⅓
Middle part of ureter (11 cases)			
Operative	13.5	64	70
Operative cystoscopy	14.5	36	30
Lower part of ureter (90 cases)			
Operative †	16	24.4	54.8
Operative ‡ cystoscopy	7.3	75.6	41

* This term is used in lieu of cystoscopic manipulation as the latter term does not indicate ureteral meatotomy and extraction of stones.

† There was epididymitis in 1 per cent.

‡ In 3 per cent of cases the ureter was perforated with instruments, and in 2 per cent there was prostatic abscess.

The operative approach to lower ureteral stones, with the percentage of cases involved, was as follows:

Lower quadrant	65%
Transvesical	22%
Vaginal	13%

The chemicals observed in the stones, in order of frequency, are as follows:[2] (1) calcium carbonate, (2) calcium phosphate, (3) urates, (4) mixtures of calcium carbonate, calcium phosphate and urates, and (5) oxalate (rare).

The greatest difficulties were encountered with small rough stones in the terminal aspect of the ureter. Urologists are aware of the many complications, which usually occur in the following order: pyelonephritis, prostatic abscess, septicemia and, occasionally, perforation of the ureter if operative cystoscopy is the method of choice. On the other hand, if one decides to do an open operation, the stone may be difficult to locate. Encountering the aforementioned difficulties many times has enabled us to devise a new technic for open removal of the type of stones previously mentioned.

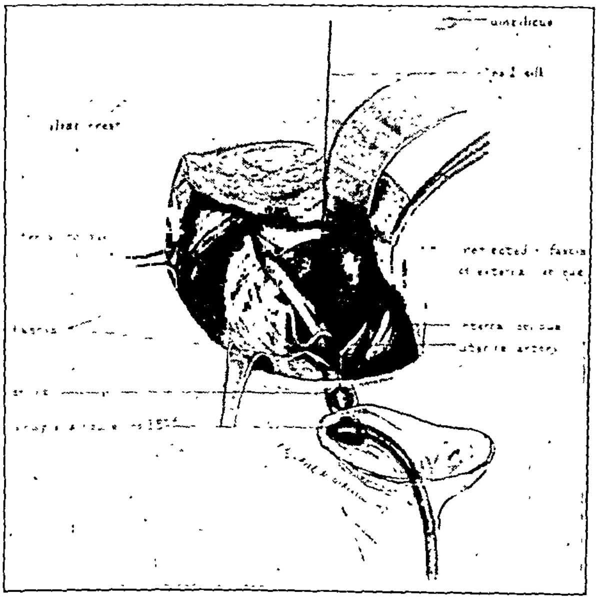

Fig. 1.—A new technic for open removal of stones in the terminal ureter is shown. By pulling upward on the silk, which is attached to the bougie, the ureter is brought up to a more accessible position and is straightened, which facilitates the removal of the stones.

After one decides that an open operation would be advisable for small rough stones in the terminal aspect of the ureter, a no. 4 or no. 5 catheter is passed by the stone and a bougie is tied to the end of the catheter with a piece of no. 1 silk, about 10 inches (about 25 cm.) long. The perineum and genitalia having previously been prepared as a sterile field, the bougie is passed into the bladder and the end of the ureteral catheter is covered with sterile towels. Through a Gibson incision, the lower aspect of the ureter is exposed and opened above the point where the uterine artery crosses the ureter in women or a similar point in men. The ureteral catheter is then pulled through the ureterotomy incision and detached from the silk. At this point the bougie fits over the ureteral orifice. By gentle traction on the silk, the lower aspect of the ureter is not only brought up to a more accessible place but, instead of forming a curve with the bow outward, the ureter is now straight. As a result of these two factors one can extract the stone with little trauma. It should be emphasized that operation for stones in the lower part of the ureter is made easier and one is less apt to open the peritoneum if the fascia covering the ureter is incised with a scalpel down to the outer coat of the ureter. Also, the fascia which is continuous with the peritoneum is dense at the point where the ureter crosses

---

From the Urological Service of Drs. McKay, McKay and Baird, Memorial Hospital, Charlotte, N.C. Dr. Lynch is resident in urology at this hospital.

Read before the Section on Urology at the Ninety-Sixth Annual Session of the American Medical Association, Atlantic City, N. J., June 13, 1947.

1. Discrepancies in total figures are due to the fact that there were stones in more than one location in several cases.

2. Personal communication to the authors from Dr. Walter Summerville, Summerville and Byrnes Laboratories, Charlotte, N. C.

the iliac vessels and just behind the bladder; sharp dissection at these points is desirable (fig. 1).

REPORT OF CASES

Case 1.—Mrs. R. O. K. (fig. 2) was first seen on Jan. 8, 1947 with a history of colic in the left kidney side ten days previously, followed by three attacks. Otherwise her past medical history was noncontributory. General physical examination revealed no abnormalities. Urinalysis revealed microscopic traces of blood, with occasional white blood cells. Cystoscopy revealed an impassable obstruction in the lower part of the left ureter, and a roentgenogram revealed an opaque shadow, 6 by 4 mm., in the region of the obstruction. With the patient under "pentothal sodium" (sodium 5 ÷ ethyl 25 — [1 — methyl-butyl] thibarbiturate) anesthesia, the second attempt at passing a no. 4 ureteral catheter to the left kidney was successful, and the oatheter was left in place for three days. During the next three days, two attempts on different days, with spinal anesthesia, were made by each of us to pass another catheter up the left side, without success. On the last attempt, the catheter, which had been in place for six days, was pulled halfway down the ureter and could not be passed back to the kidney.

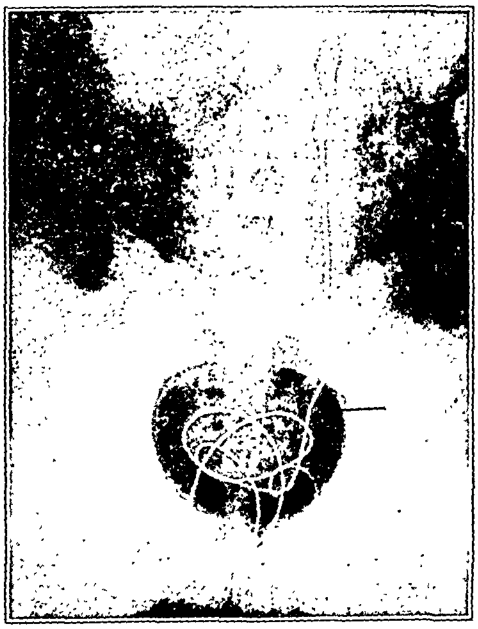

Fig. 2 (case 1).—Small rough stone in the ureter, which did not respond to dilatation and which was removed with the new technic presented.

We then decided to remove the stone, using the procedure previously outlined, as the ureter was now completely blocked and ureteral obstruction, in addition to the stone, was present. This method was successfully carried out, with the removal of a 6 by 4 mm. rough stone, and a decided narrowing of the ureter at the point where the stone had stopped was observed. The diminution in caliber at this point was due to periureteral fibrosis, which was cut parallel with the ureter, and the lumen then dilated so that it would admit a no. 14 urethral catheter. The postoperative course was uneventful, and the patient was discharged nineteen days after admission in good condition. Two months after the operation, cystoscopy was performed and a no. 8 ureteral catheter was passed, without any obstruction, to the left kidney.

Comment.—The method outlined for dealing with small rough stones in the lower part of the ureter has certain advantages, particularly if ureteral stricture or undue angulation of the ureter is present. If too vigorous attempts are made to remove such stones with the stone baskets, the end result of such trauma may be more disastrous than the original disease. If the ureter is perforated above the point of obstruction, without effecting free drainage, decided fibrosis results. This occurred in a case similar to the one just reported. On the other hand, conservative or expectant treatment often results in multiple hospital admissions with pyelonephritis; or if patients with this disease do not have pain, they may not return and a hydronephrotic sac or pyonephrosis might develop.

The transvesical or intravesical approach to impacted stones in the intramural part of the ureter or just back of the bladder is of considerable value at times. In making such an approach it is of importance that the perivesical fascia be cut just above the symphysis transversely, so that the space of Retzius is not entered. The peritoneum is then reflected off the bladder, so that the region of the ureter on the side of the stone can be palpated; this ureter does not have to be exposed. An incision is then made in the bladder, so that a ureteral meatotomy can be done on top of a grooved director. At this point, the operator's left hand is placed behind the bladder, in the region of the lower aspect of the ureter, and pressure is exerted on the ureter and the bladder, to prevent the stone from slipping upward. Using the right hand, the stone can easily be extracted with a curved hemostat. Under favorable conditions, this procedure is accompanied with little shock and there is less disturbance of normal functioning.

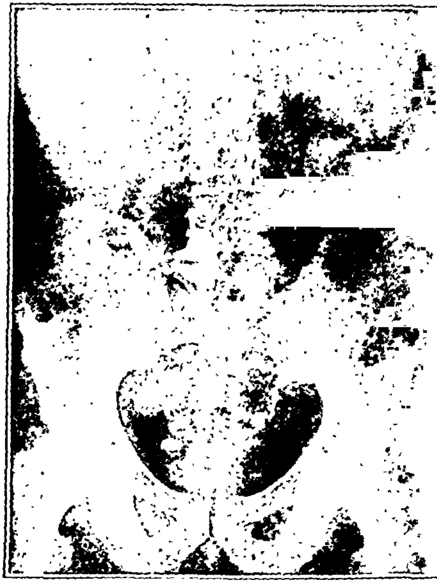

Fig. 3 (case 2).—Large stone in the terminal aspect of the ureter, which was removed via transvesical approach.

Case 2.—J. K. D. (fig. 3), aged 66, was first seen on July 29, 1946, because of increasing symptoms of prostatism for one year, with complete urinary retention on two occasions and intermittent colic of the right kidney for three or four years. The remainder of his history was noncontributory.

Physical examination revealed an old man who was in considerable distress, but whose appearance was in accordance with his stated age. There was evidence of hypertensive cardiovascular disease (his blood pressure was 170 systolic and 120 diastolic). Rectal examination revealed a grade 1 benign enlargement of the prostate. The residual urine averaged 220 cc.

Laboratory Examination.—Blood cell counts were normal. The urine contained a few red blood cells and white blood cells. Roentgenograms and cystoscopy revealed an impacted stone (1 by 0.5 cm.) about 1.5 cm. from the right ureteral orifice. A transvesical approach to the stone in the lower part of the right ureter was carried out, and a right angle de Pezzer catheter was left in place suprapubically for seven days. A suprapubic prostatectomy was done, and no hemostatic agents were used in the prostatic bed. A Freyer tube was left in the bladder for twenty-four hours and then removed. The patient's postoperative course was uneventful, and he was discharged after seventeen days in the hospital, voiding freely and without any residual urine. The suprapubic sinus had ceased to drain four days prior to discharge. The red blood cell count and the hemoglobin were essentially the same on discharge as on admission.

Comment.—In this case with two entities, the transvesical approach to the stone (1 by 1.5 cm.) seemed logical, because the stone was impacted 1.5 cm. from the ureteral orifice. After the stone was removed, the first stage of the suprapubic prostatectomy had been completed; thus, it was a two in one operation. If a retrovesical approach to this stone had been performed, the trauma would have been increased. Incidentally, no hemostatic agents were used in the prostatic bed following the enucleation, and the red blood cell count and the hemoglobin were essentially the same on discharge as on admission.

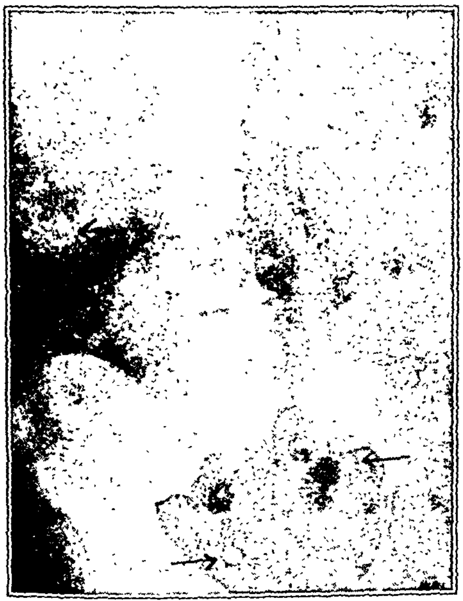

Fig. 4 (case 3).—Urogram (intravenous) showing stones in the lower part of each ureter and a nonfunctioning kidney with stones on the right side and good function on the left. The stone on the left side was removed extravesically, and the one on the right was removed transvesically.

Case 3.—G. H. (fig. 4), aged 59, was admitted to the urologic service with a history of complete urinary retention, chills and fever prior to admission. Also, the patient had noticed that his urine was foul smelling and had the appearance of pus.

The patient had previously been immobilized on the orthopedic service for several months, at intervals over a period of years. In 1908 the patient had chronic osteomyelitis of the left knee, which necessitated his spending one year in bed, and in 1937 he had a pathologic fracture of the upper part of the left leg, which would not heal and which necessitated amputation. Again in 1945, the patient was immobilized for several months because of an injury of the back. Otherwise, his past history was noncontributory.

Physical examination revealed the man to be somewhat lethargic, appearing much older than his stated age. There was evidence of generalized arteriosclerosis and hypertensive cardiovascular disease without failure. The left leg had been amputated at the middle of the thigh. Rectal examination was nonrevealing. The urine contained equal parts of sediment and liquid, with many white blood cells. Culture revealed Staphylococcus aureus. The blood cell counts showed 10,750 white blood cells and 61 mg. of nonprotein nitrogen per hundred cubic centimeters. The blood was otherwise normal.

Urograms revealed no function on the right side, with multiple stones in the lower pole of the kidney and a 12 mm. stone in the lower part of the right ureter. A hydroureter with pyelectasis was present on the left, with an 8 mm. stone in the lower part of the ureter.

Cystoscopy revealed the neck of the bladder to be normal and the stone on the right to be 1.5 cm. from the ureteral orifice, while the stone on the left was about 4.5 cm. from the ureteral orifice. The stones in the lower part of both ureters were approached through a midline incision. As the left kidney was functioning in contrast to nonfunctioning pyonephrosis on the right side, the lower part of the left ureter was mobilized first and the stone removed through a ureterotomy incision. This side was then drained and packed off, and the stone on the right was removed via the transvesical route described previously.

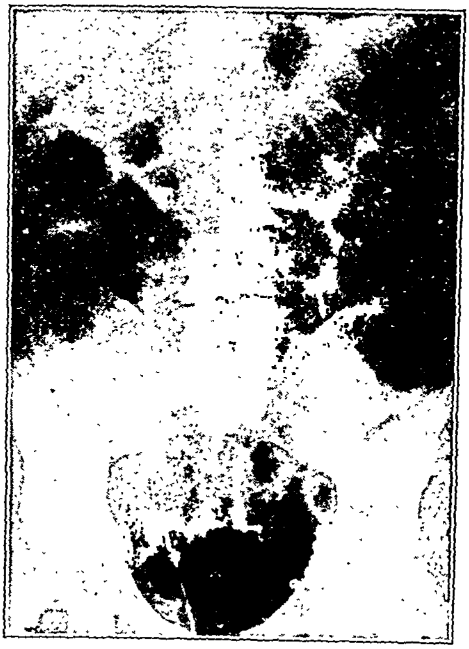

Fig. 5 (case 4).—The stone is engaged in the basket; it was removed after traction was applied for two days.

The patient's postoperative course was uneventful except for three days of low grade fever. He was discharged with office follow-up planned, on the twenty-first postoperative day, with the incision healed but with grossly purulent urine. Two months after discharge the urine was grossly clear, so that he returned to the hospital for further study. A cystogram revealed no ureteral reflux on the right, and cystoscopy showed the ureteral orifice to be normal. Urograms revealed no function on the right and no abnormality on the left side. A retrograde pyelogram of the right kidney revealed little parenchyma, with small calculi in the lower calyx. Due to the fact of poor operative risk and because the patient has remained asymptomatic and clinically well for a year, nephrectomy on the right side has not been advised.

Comment.—A transvesical approach to the right ureteral stone was technically the easiest operation that could be performed, as the stone was about 1.5 cm. from the orifice and the long-standing periureteritis of the entire right ureter would have made the retrovesical approach difficult. Cystostomy drainage of the purulent material from the right kidney was more desirable than drainage from an opening in the ureter just behind the bladder.

Why this patient had urinary retention is still puzzling, unless the decided cystitis and large particles of pus and debris from the right kidney account for the retention. In the average case a nephrectomy on the right side would have been done, but this case is illustrative of the advantage of free drainage when a kidney is practically destroyed. The function of the right kidney does not help this patient sustain life, but with such a poor operative risk a nephrectomy could be fatal.

Urologists have certain criteria for the open or closed method of removal of ureteral stones, but it is difficult to find these indications enumerated in a concise manner in the literature. The reason for the paucity of such articles is probably that each case necessitates a decision based on individual factors. Nevertheless, a knowledge of the following facts has been of considerable value to us in arriving at a decision as to which method to use in each case.

1. Location in the ureter
2. Size and contour of the stone
3. Size of the ureter and amenability to dilatation, e. g., pregnancy and postpartum state
4. Bilateral ureteral stones
5. Ability to change the axis of the stone
6. Ability to pass a catheter by the stone
7. Condition of the kidney above the stone
8. Temperament of the patient (*some patients fail to tolerate ureteral catheters*)
9. Ability to obtain free drainage after the removal of the stone by operative cystoscopy
10. Ureteral disease, including strictures and undue angulations of the ureter
11. Disease of the bladder, e. g., strictures of the urethra, epididymitis, fulminating cystitis and enlarged prostate in men

CASE 4.—H. H. B. (fig. 5), aged 52, was admitted to the hospital on Oct. 17, 1944, with colic of the right kidney. Since the age of 20, this patient had been having attacks of renal colic on both sides and had passed several small stones. Otherwise, his history was noncontributory. Physical examination revealed a well developed 52 year old white man, without any abnormal observations.

Urinalysis revealed a few red blood cells and white blood cells and amorphous phosphates. Nonhemolytic Staph. aureus and streptococci were cultured from the urine. The calcium in the blood was 10.6 mg. per hundred cubic centimeters (checked).

A roentgenogram of the kidneys, ureters and bladder revealed an 8 mm. stone in the lower part of the right ureter and a 5 mm. stone in the upper part of the left ureter, with a similar one in the middle part of the left ureter. Urograms revealed a double pelvis in the right kidney.

A meatotomy of the right ureter was done; the ureter was dilated with a catheter for three days, and another cystoscopy was done, with an unsuccessful attempt at dislodging the stone. After the second cystoscopy the patient had chills and fever for nine days, during which time the temperature ranged as high as 105 F. Blood cultures were consistently negative. During the patient's entire hospital stay, he received penicillin and, for a part of the time, sulfadiazine, with a resultant level in the blood of 12 mg. per hundred cubic centimeters. Six days after the ureteral meatotomy, the stone was engaged in a basket and traction was exerted after the method of Ockerblad, by placing a rubber band on the end of the basket and leaving it for two days. After two days of traction cystoscopy was performed for the fourth time and the stone pulled into the bladder, but, because of the size, it had to be crushed for removal from the bladder.

The patient was discharged on the fourteenth hospital day, in apparently good condition, and readmitted two weeks later, with chills, fever, nausea and vomiting, symptoms which had returned one week after his discharge. Apparently the patient had urinary sepsis, which quickly responded to treatment with penicillin and intravenous injections of dextrose. He was discharged three days after admission. The patient was seen one month after discharge, in excellent condition. He was advised to have the stones removed from the left ureter, but he has not been seen since.

Comment.—The patient would probably have had a less stormy convalescence and less permanent renal damage if this stone had been removed by open operation. The urine was infected with Staph. aureus and streptococci. At the time of his admission to the hospital and during the six days of manipulation of the stone, there was practically no drainage from the kidney. Free drainage of infected urine could have been obtained by open operation, thus minimizing the possibility of pyelonephritis and more nearly approaching normal function. The presence of two stones in the left ureter was the factor which persuaded us to use operative cystoscopy on the right side, but, in retrospect, it would seem that it should have been a discouraging factor.

CASE 5.—Mrs. V. C. (fig. 6), aged 43, was first seen on March 13, 1945, with a history of attacks of renal colic on the left side for several months, associated with chills and fever but otherwise not remarkable. The past history was noncontributory except for the removal of a stone from the right kidney three years previously. The results of the physical examination were within normal limits.

Urinalysis revealed a few red blood cells and white blood cells. Hemolytic Staph. aureus was cultured from the urine. The calcium in the blood was 10.3 mg. per hundred cubic centimeters.

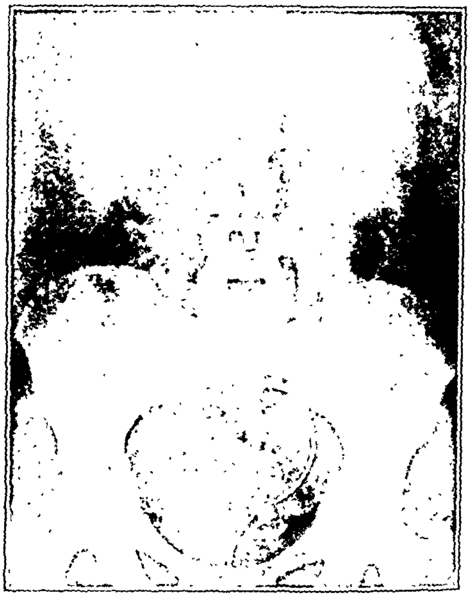

Fig. 6 (case 5).—A roentgenogram of the kidneys, ureters and bladder showing a large stone in the terminal aspect of the ureter, with a catheter dilating the ureter. The stone was removed by applying digital pressure via the vagina.

Urograms revealed a bifid pelvis on the right side and a double pelvis with a complete double ureter, without hydronephrosis, on the left, with a huge stone, as shown in figure 6, in the lower part of the left ureter.

Under spinal anesthesia a meatotomy was done on the left ureter. The orifice was visualized, and, with digital pressure via the vagina, the stone was pushed into the bladder. The stone was so large that it had to be crushed before removal from the bladder. The patient's postoperative course was uneventful, and she was discharged on the fifth hospital day. Subsequent follow-up in the office for one month was uneventful.

Comment.—After observing a case in which so large a stone was removed by operative cystoscopy, one could doubt that the size of the stone was a factor in the decision as to whether or not an open operation should be done in the lower part of the ureter for stones. In favor of operative cystoscopy, the stone was round and smooth, so that it could be pushed out of the ureter with a finger in the vagina, without the use of metal instruments in the ureter. If metal instruments had been used in the ureter in this patient, followed by edema with the resultant stasis in the presence of hemolytic Staph. aureus, the postoperative course would have been, in all probability, similar to that of H. H. B. Free drainage following removal is important. In removal of large smooth stones by operative cystoscopy from the terminal aspect of the ureter, downward digital pressure via the vagina in women or the rectum in men is at times a valuable adjunct.

SUMMARY

Two hundred patients with urinary calculi were observed during the past three years, with a mortality rate of 0.5 per cent. The cases are analyzed and classified according to the location of the stones. The cases in which there were ureteral stones are analyzed from the following standpoints: methods of removal of stones, average days in the hospital, percentage of stones removed by open operation and operative cystoscopy and complications. A new method for open removal of small rough stones from the terminal aspect of the ureter is presented, with an illustrative case. The transvesical approach to stones in the terminal aspect of the ureter is discussed, and illustrative cases are presented. Factors which enable one to decide on the method for removal of ureteral stones are listed, accompanied with reports of illustrative cases.

ABSTRACT OF DISCUSSION

OF PAPERS BY DRS. MCKAY, BAIRD, LYNCH AND COLONEL KIMBROUGH, MAJOR FURST

DR. A. E. GOLDSTEIN, Baltimore: In the analysis of the management of urinary calculi, Drs. McKay, Baird and Lynch held to no conventional procedure, and rightfully so, as each case or group of cases requires a different procedure. Of 125 patients with ureteral stones, the authors performed an open operation in about one third; half of the operations were in the lower part of the ureter. This is approximately what is done in most of the larger clinics. At the Sinai Hospital in Baltimore, my colleagues and I have, for the past few years, gradually increased the percentage of open operative procedures for ureteral stones. Our feeling is that a patient with a calculus the diameter of which is over 0.5 cm., particularly if it is rough and irregular in shape, will have a difficult time in passing it or in having it removed with one of the various ureteral instruments employed, not that larger calculi have not been removed or passed. If we fail after two attempts, an open operation is suggested. The delay in gradually dilating a ureter over a period of several weeks or the trauma produced by the introduction of the various stone removing instruments, with occasional perforation of the ureter, is far more damaging to a ureter or a kidney than simple exposure of the ureter and removal of the calculus. I am in accord with their belief about open operations and am certain that more open ureterolithotomies will be done. Our experience with the various stone removing devices has not been good. In a recent case a Council stone remover was passed up a ureter and the stone engaged, and the instrument with the stone remained caught in the intramural portion of the ureter. Gradual traction brought the instrument, the stone and a large portion of the ureteral mucosa into the bladder, which led to stricture, a ureterocele and, ultimately, nephrectomy. In analyzing the percentage of patients that suffer some morbidity (40 per cent) following the removal of ureteral calculi by cystoscopic methods, one feels that some of the patients would have fared better if an open operation had been performed. However, I should like some enlightenment from the authors as to the reason for the morbidity (60 per cent) suffered by the patients who had an open operation. Open operative procedures at Sinai Hospital are rarely accompanied with any morbidity. A new technic for handling some of the calculi in the lower third of the ureter has been devised. We have been rather fortunate and have not encountered any difficulty in locating ureteral stones with an open operation; but should we encounter difficulty, we shall employ the method suggested by the authors.

DR. FRANK C. HAMM, Brooklyn: In a recent survey of 255 cases of ureteral stone, my colleagues and I found a history of previous calculi in 29 per cent. It is the principal cause of death in spinal injuries with paraplegia; of 42 cases observed during the war, 2 deaths occurred, both from recurrent bilateral renal stone, accompanied with obstruction and urosepsis. The prevention of recurrence in the paralyzed patient deserves special consideration. During recumbency, there is a rapid mobilization of calcium from the bones, resulting in a high level of urinary excretion, lasting for from two to three months or more. The curve of urinary calcium excretion then gradually falls and may slowly return to a normal quantity, or it may level off on a plateau that is considerably above the normal level. Stasis is a natural corollary of recumbency. Because of inactivity, crystals and pieces of epithelium, which would ordinarily be excreted in the urine, tend to collect in the dependent calyces. These particles remain to provide a nidus in which calcium is readily precipitated from the supersaturated urine. Mobilization is indicated at the earliest moment. Turning these patients every two hours is not enough; they must be gotten out of bed into an upright position. Careful attention to nutrition is important. Most of these patients have a diminished blood protein content, with a reversal of the albumin-globulin ratio. A diet with a high level of protein and adequate mineral and vitamin content is required. Large doses of vitamin D should be avoided, as this may increase the excretion of calcium. The acid ash diet is not employed without specific indications, and a check of the urinary calcium excretion should be made, as in many instances the excretion of urinary calcium is increased during the use of the acid ash diet. Stasis provides the ideal groundwork for infection, which almost always develops. Infection is also introduced by catheterization, which is so often necessary in the management of this condition. The urea splitting organisms are the most dangerous and are more difficult to eliminate. Weekly examination of the urine for evidence of infection and a roentgenogram once a month, for evidence of calculary shadows, are helpful and necessary procedures. Colonel Kimbrough emphasized the care that must be taken at the time of operation to prevent the recurrence of calculi. All of the calculus must be removed, and the use of roentgen rays at operation is routine. Predisposing obstructive factors should be corrected. The relief of ureteropelvic obstruction or the resection of a bottleneck calyx are the procedures commonly employed. Careful postoperative follow-ups are indicated to eliminate all infection.

DR. HENRY SANGREE, Philadelphia: Colonel Kimbrough and Major Furst are to be congratulated on their presentation and the carefully made follow-up of their large series of patients. It is more difficult in civilian practice to follow cases for recurrent calculi. In a recent series of 50 cases of renal and ureteral calculi, the recurrence was 14 per cent. This is lower than many investigators report. Crabtree had considerably over 50 per cent. Recurrent calculi may be divided into two types: true recurrence, the formation of another stone after complete removal of the calculus, and false recurrence, or fragments or small calculi remaining after operative removal. Three major causes can usually be investigated: (1) culture of the urine to show infection, especially of urea splitting organisms, and a search for foci of infection, (2) analysis of the stone, of which chemical examination and roentgen ray crystallography present the most accurate determination of composition, (3) search for endocrine disturbances causing the formation of calculi, especially hyperparathyroidism. In our surgical methods of prevention at the time of operation, my colleagues and I look for bands and anomalous vessels, which occur in 30 per cent of our patients, and for nephroptosis, moderate or severe, which is seen in 28 per cent of our patients. The former is corrected by excision and the latter by nephropexy. Large calculi, usually associated with infection, are more apt to cause recurrent stones than small calculi, which are less likely to harbor infection and which cause a smaller amount of renal damage. Fluoroscopy and examination with roentgen rays in the operating room help to eliminate many false recurrences of stone by showing the presence of small stones and the persistence of fragments. Prevention of renal calculi is important.

Urostasis should be corrected; antiseptic drugs may be used, especially methenamine, neoarsphenamine and penicillin, *to effect a shift in the reaction of the urine.*

Dr. George R. Livermore, Memphis, Tenn.: I wish to discuss two points in Drs. McKay, Baird and Lynch's paper. First, as the inventor of one of the metal instruments for the removal of stones in the ureter, I wish to go on record as condemning them; they are dangerous and their use may result in damage or puncture of the ureter. Many urologists have had the same experience that Dr. Goldstein mentioned and that Dr. McKay reported. I feel that cystoscopic manipulation of ureteral stones should be limited to the use of ureteral catheters and flexible bougies. I agree with Dr. Goldstein that one should be gentle in the introduction of any instrument, as prolonged punching with catheters and bougies about the stone is apt to produce injury to the ureter, with resulting formation of cicatricial tissue and stricture of the ureter. I have seen cases in which this has occurred. Second, when to operate depends on the condition of the patient and the best judgment of the operator. If one can pass a catheter beyond the stone and establish drainage and if the kidney is not severely damaged or it improves with drainage, one can afford to wait. If however, the stone is impacted and one cannot succeed in passing a catheter beyond it, it would be well to remove the stone by operation as soon as is feasible.

CLOSING DISCUSSION

Dr. Hamilton W. McKay, Charlotte, N. C.: Reference has been made in this paper to the frequent occurrence of stone in persons in the Carolinas. A few years ago, one of the medical directors of one of the leading life insurance companies noted that there were many rejections of applicants from the Piedmont area of the Carolinas because of urinary lithiasis. He made an investigation and found that formation of calculi in persons in this section was five times as frequent as it was in the remainder of the United States. I have not been able to verify this statement. Nevertheless, when one considers that this series of 200 cases in a three year period represents one service of a hospital of four hundred beds; not connected with a medical school, with three urologists on that service and five other full time urologists practicing in the hospital, 200 cases of stones is a tremendous incidence. We have reviewed the 200 cases with the following points in view: 1. Certain criteria must be applied to the patient after study of his disease to determine which patient should be operated on and which patient should be treated by operative cystoscopy. In several cases we have failed because the case was not individualized. 2. We have had difficulty in open removal of some stones in the lower part of the ureter, and for this reason we have presented a technic, devised by us, which gives one better control of the lower part of the ureter, with less trauma and greater ease in removal of such stones than is true with other technics. This is done by lifting the trigone of the bladder and the lower part of the ureter up into the wound and at the same time straightening the lower part of the ureter, as described. 3. Over 50 per cent of the patients have had a prolonged stay in the hospital because of complications, such as infections of the blood stream, urinary sepsis without infection of the blood stream, prostatic abscesses or other complications. We do not believe that this should have occurred, and we are taking steps now to correct it. At the present time we believe that after the patient has been properly studied and the ureteral stone located, if there is a question as to which method should be used, an open operation should be the method of choice. Our patients are usually out of bed the second or third postoperative day, with a less stormy convalescence than is the case with other technics. Dr. Goldstein raised the point of 50 per cent of complications from infection in open operation. The manipulation which most of these patients had experienced before open operation was done was responsible for this occurrence.

Colonel J. C. Kimbrough, Washington, D. C.: I was especially interested in what Dr. Hamm said. He criticized my not encouraging the patients to exercise; movement every two hours was not enough, I agree with him. I did not include much of that aspect of treatment in the paper because of concentration on the operative technic of removing recurrent calculi. Since the last war rehabilitation service has been instituted in army hospitals, veterans hospitals and probably civilian institutions. It has now been incorporated in army hospitals on a service level and is called the Service of Physical Medicine. There are elaborate systems of exercises to prevent calculus and to remove calculus. The patient with a ureteral calculus is instructed as to which movement will make the calculus pass and which movement will keep it in. We used this technic, and in certain selected cases it seemed to give reasonable results. Dr. Bransford Lewis employed what he called succussion to remove stones, in which he actually shook the stones out of the patient. If the stone had lodged in the lower calyx on the right side, he laid the patient on his left side, took him by the feet and shook him one way until the stone passed into the pelvis, then he stood him on his feet and shook him the other way until it passed into the bladder. We are having just about as much success at that as Dr. Bransford Lewis had.

DIAGNOSIS OF HEPATITIS BY HISTOLOGIC AND FUNCTIONAL LABORATORY METHODS

HANS POPPER, M. D. Ph. D.
and
MURRAY FRANKLIN, M. D.
Chicago

The differential diagnosis of acute hepatitis involves the separation of (1) acute damage of the hepatic parenchyma from other diseases simulating it, especially in the absence of jaundice, and (2) the different forms of acute parenchymal disease from one another. The latter may be either inflammatory or degenerative in nature. In the liver more so than in any other parenchymal organ, these two basic pathologic phenomena can be differentiated only with extreme difficulty. For practical reasons it is, therefore, preferred to call acute parenchymal disease of the liver "hepatitis."

The identification of acute hepatitis without jaundice has become important in view of the recently described infectious form[1] which is demonstrated by laboratory procedures, such as determination of sulfobromophthalein sodium retention, cephalin-cholesterol flocculation, thymol turbidity and elevated excretion of urinary urobilinogen. In some instances pathologic changes have been found in biopsy specimens. Damage to the liver without jaundice due to industrial poisons can be shown by similar procedures. In addition, the urinary excretion of bilirubin has been emphasized.[2]

Of greater clinical significance is the differentiation of the various forms of acute hepatitis when presence of jaundice indicates pathologic changes in the liver. Omitting the hemolytic variety, jaundice is usually divided into the medical form—hepatitis and cirrhosis—caused by primary disease of the liver parenchyma and the surgical form secondary to tumor, stones or stricture. Typically, in the medical form, impairment of liver cell function will exceed disturbance of bile flow, and the reverse is true in the surgical form. The table lists the most commonly used laboratory tests arranged

according to this principle.[3] Theoretically, therefore, these laboratory examinations in combination with the clinical findings should provide the diagnosis, were it not for several rather common exceptions to this rule; namely, (1) intrahepatic biliary obstruction complicating the medical form[4]; (2) secondary damage to the liver cells due to prolonged biliary obstruction, and (3) secondary damage to the liver cells due to purulent infection of the portal triads.

One approach to the solution of the aforementioned problems is liver biopsy in jaundiced patients. In recent years liver biopsy has been extensively employed by many investigators[5] following the extensive studies by Scandinavian[6] and British[7] workers. This paper represents an attempt to differentiate various forms of hepatitis on the basis of histologic examination of biopsy specimens. The pathologic changes in the biopsy specimen were studied as unknowns and later correlated with the results of laboratory and clinical observations.

MATERIAL AND METHODS

Biopsies, sometimes repeated, were performed on 243 patients, 43 of whom had cirrhosis and 125 acute or subacute hepatitis, the latter group representing the material of this study. Most of the biopsies were obtained by needle and some by excision during operation. Autopsy material was not included in this study, since comparison of biopsy material shortly before death with autopsy material shortly after death, obtained in a few cases, revealed that pronounced histologic changes develop rapidly after death. In arriving at the histologic criteria used, not only previous biopsy studies, especially those by Roholm and associates,[6] but also many of the excellent reported investigations on autopsy material[8] were utilized. In some instances, as in the differentiation between toxic and infectious hepatitis, our own experiences in fatal cases were helpful.[9] A series of hepatic function tests were performed simultaneously with the biopsy and at repeated occasions during the entire course of the disease. These included the tests listed in the table. As example of the groups in the table, cephalin-cholesterol flocculation,[10] thymol turbidity,[11] albumin-globulin ratio, serum al-

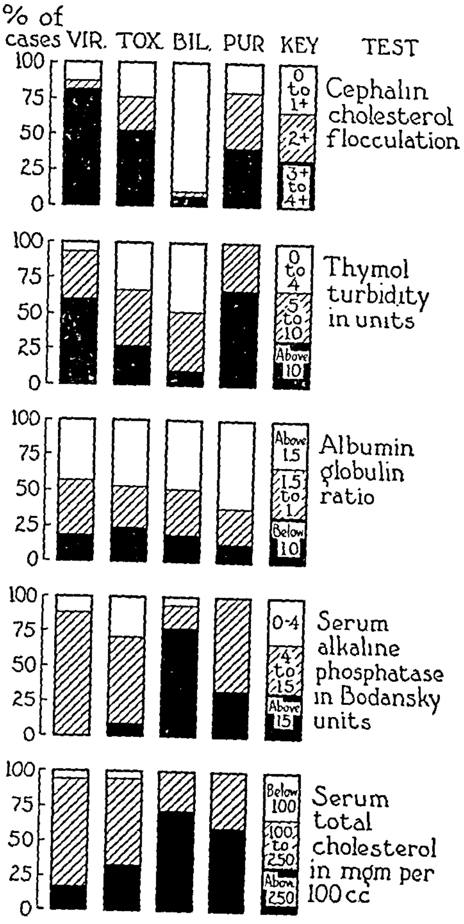

Fig. 1.—Relation of results of function tests to types of hepatitis in the studied cases. Solid black represents definite pathologic range, hashed portion (except for total serum cholesterol) slight pathologic range and white, normal range.

kaline phosphatase[12] and total serum cholesterol are recorded in figure 1.

CLASSIFICATION OF HEPATITIS

The primary (medical) type of hepatitis was subdivided into an infectious form due to a virus and a toxic form due to a multitude of etiologic factors; the secondary (surgical) hepatitis into a biliary and a purulent form.

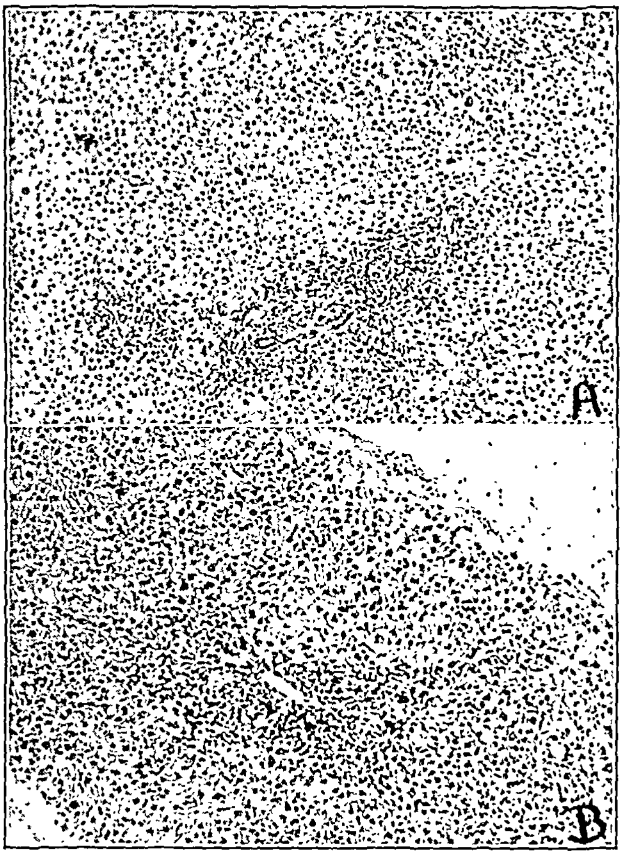

Fig. 2.—Biopsy specimens of patients with virus hepatitis. *A*, mild stage, revealing slight degree of damage to the liver cells, moderate mesenchymal reaction characterized by proliferation of Kupffer cells and intralobular and periportal infiltration of round cells. *B*, severe stage. The pronounced damage to the liver cells is indicated by irregularity of nuclei and cytoplasm. The mesenchymal reaction is also more outspoken.

"Virus" Hepatitis (16 cases studied, 5 with repeat biopsies).—The name "virus hepatitis" is preferred, although the virus cannot usually be demonstrated, since the term "infectious" may also apply to bacterial infections, such as in pneumonia or cholangitis. Virus hepatitis may appear as an epidemic or sporadic form due to infection by the gastrointestinal route and characterized by an incubation period of seventeen to forty days, or as homologous serum jaundice acquired by parenteral injection of blood or its derivatives; this latter form is characterized by an incubation period of sixty to one hundred and thirty-five days.[13] The prodromal syndromes are gastrointestinal or "grip"-like in character. Etiologic factors such as transfusions, injections or army contact could be elicited in only 4 cases.

All tests for damage to liver cells were positive in result, the degree depending on duration and severity of the disease. There was some impairment of bile flow, the alkaline phosphatase being usually slightly elevated. Episodes of intrahepatic biliary obstruction were found in 12.5 per cent of the cases.

Pathologically there was a diffuse damage to liver cells, slightly more pronounced centrally. The liver cells revealed irregular staining qualities of cytoplasm and nuclei and hazy outlines and often were completely hyalinized (Councilman bodies). Considerable regeneration, especially central, may be found early and become prominent in the healing stages. Fatty changes were rare. The strong mesenchymal reaction was characterized by proliferation of Kupffer cells and accumulation of round cellular. often phagocytic elements in and occasionally around the sinusoids; the periportal fields also revealed dense infiltration with similar cells. Neutrophilic polymorphonuclear leukocytes were almost completely absent; eosinophils, however, were not rare (fig. 2). Proliferation of immature bile ducts was found in more protracted cases, often also being associated with marked fibrosis radiating from the periportal fields. In the fatal form "explosive" destruction of liver cells with almost complete phagocytosis of the cellular remnants was present.

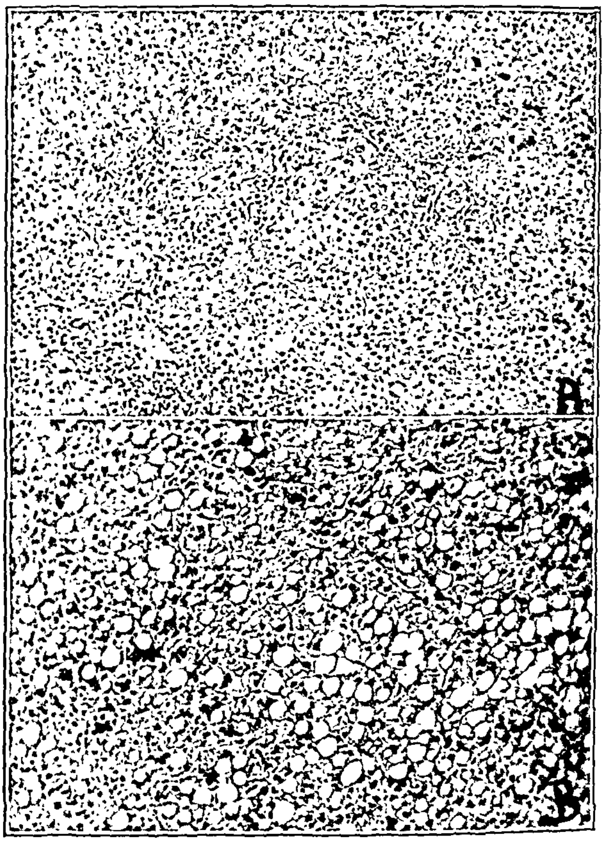

Fig. 3.—Biopsy specimens of patients with toxic hepatitis. *A*, Pronounced damage to liver cells, accentuated in central portion of lobule. There is little mesenchymal reaction, especially so in the periportal area. *B*, Diffuse fatty metamorphosis. The liver cells are damaged and many bile casts are noted.

Toxic Hepatitis (21 cases studied, 10 with repeat biopsies).—It was due to various chemical (e.g., arsenic and cinchophen), bacterial (e.g., pneumococci) or endogenous (as in hyperthyroidism) toxins, or unknown injurious substances. In 8 cases an etiologic factor was elicited. The prodromal symptoms were variable, often being of short duration; occasionally there occurred protracted malaise. In general, the results of tests for damage to liver cells were abnormal. However, in a considerable number of cases the cephalin-cholesterol flocculation and thymol turbidity reactions were negative even when considerable damage to liver cells was indicated by the other tests. Tests indicative for impaired bile flow were positive in result more often than in the virus form, and intrahepatic biliary obstruction occurred in 33.3 per cent of these cases. Renal impairment was present in 28.5 per cent of the cases, as indicated by elevation of nonprotein nitrogen and other clinical and laboratory evidence of renal damage, such as oliguria and albuminuria. This renal impairment was even more strikingly represented in a series of fatal cases already mentioned.[9]

[13] Neefe, J. R.: Recent Advances in the Knowledge of "Virus Hepatitis," M. Clin. North America **30**: 1407 (Nov.) 1946.

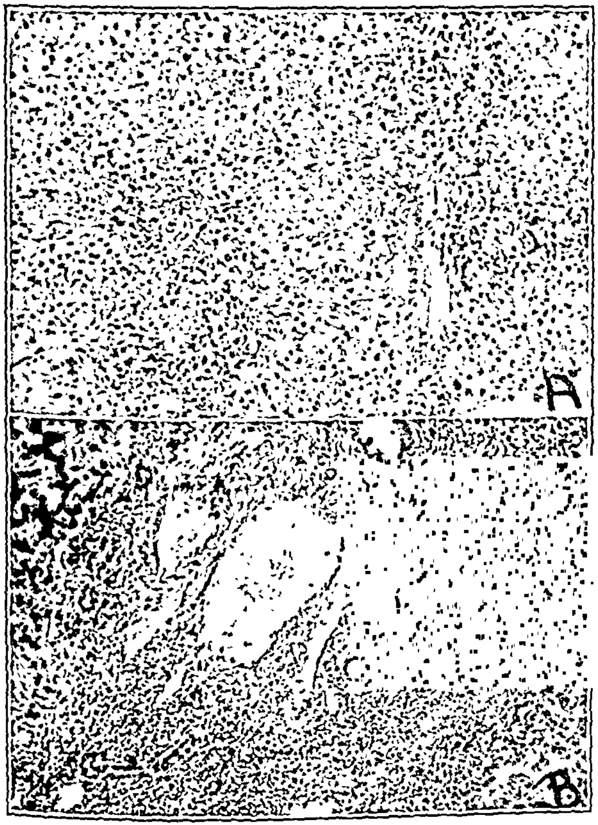

Fig. 4.—Biopsy specimens of patients with secondary hepatitis. *A*, biliary hepatitis. Bile-casts are seen in the center of the lobules. There is moderate damage to the liver cells; the periportal fields reveal fibrosis and bile duct proliferation, but little infiltration. *B*, Purulent hepatitis. Dense round and polymorphonuclear infiltration of the portal triads. The bile ducts themselves are free; the adjacent liver parenchyma shows cellular damage.

Histologically, more or less severe damage to liver cells was seen with coagulation necrosis and partial hyalinization of the cells. Fatty changes were commonly found, and in 3 cases dominated the histologic picture so as to produce diffuse fatty liver. The parenchymal damage was somewhat accentuated in the central areas. The mesenchymal reaction, when present, was decidedly subdued. Kupffer cell mobilization and round cellular macrophagic elements were not as prominent as in the virus form. Occasionally, however, a significant number of neutrophilic leukocytes could be seen (fig. 3). In the fatal cases, either central or peripheral necrosis was rather common and the gradual cell death with the presence of anuclear cell fragments was characteristic. In cases of intrahepatic biliary obstruction, bile casts appeared out of proportion to the amount of cellular damage. Proliferation of bile ducts occurred to a slight degree only.

Biliary Hepatitis (73 cases studied, 11 with repeat biopsies).—The damage to the cells is due to "back flow" of biliary products, probably bile acids. Its extent depends on duration and degree of biliary obstruction and is, therefore, far more pronounced in malignant tumors or strictures where obstruction is usually complete than in cholelithiasis. In our series, biliary hepatitis occurred in 33 patients with malignant tumors and 40 with cholelithiasis. As the process progressed, there were abnormal reactions to most tests for damage to liver cells. However, the cephalin-cholesterol flocculation was normal in most cases and the thymol turbidity only slightly elevated. The tests for biliary obstruction gave typically positive results. Renal damage as measured by elevated nonprotein nitrogen was found in 26.3 per cent of these cases. Histologically, bile casts and intracellular bile granules chiefly in the central zone indicated biliary stasis out of proportion to the degree of damage to the liver, especially in the earlier stages. However, every specimen examined revealed some damage to liver cells, predominantly in central areas. In later stages bile casts were also seen in the periphery of the lobules, the intermediary zone remaining free. Large areas of diffuse necrosis of the liver cells revealing biliary imbibition may appear (bile infarcts). Mesenchymal reaction was subdued, polymorphonuclear leukocytes being uncommon except in small focal necroses in cholelithiasis. Periportal infiltration was in the background. The Kupffer cells were proliferated and laden with bile. The periportal fields revealed a moderate amount of bile duct proliferation, and in the more protracted cases there was often pronounced periportal concentric fibrosis, sharply demarcated from the adjacent parenchyma (*fig. 4 A*). As the process progressed, the lobular pattern around the periportal fields became distorted and the picture resembled biliary or obstructive cirrhosis.[14]

Purulent Hepatitis (15 cases studied, 2 with repeat biopsies).—Purulent hepatitis is due to a bacterial infection of the portal triads apparently resulting from organisms which have passed from the portal system through the wall of the liver sinusoids into the perisinusoidal tissue spaces and are then carried to the terminal lymphatics, chiefly located in the portal triads. A perilymphangitic inflammation is set up and may encroach on the bile duct from the exterior. Less commonly, the infection can ascend via the lumen of the bile duct. The severity of the perilymphangitis, which may progress to a frank suppuration, does not depend on duration or degree of biliary obstruction and may even be found without it. It depends far more on inflammatory processes in the portal system, especially as seen in cholelithiasis. Our series consists of 11 cases of cholelithiasis, 2 of carcinoma of the pancreas and 1 each of duodenal ulcer and carcinoma of the stomach. Since this inflammation leads to toxic damage of the liver parenchyma, all tests for damage to liver cells become positive in result. The cephalin-cholesterol and thymol turbidity reactions may become positive if such a purulent process complicates previously simple biliary hepatitis. The tests for impairment of bile flow elicit positive reactions to a varying degree. Jaundice is not necessarily pronounced. However, clinical evidence of bacteremia, such as chills, fever and leukocytosis, are often encountered.

Histologically, inflammatory infiltration of the periportal fields was predominant, polymorphonuclear leukocytes being common. The bile ducts showed decided proliferation, chiefly mature in character. Leukocytic infiltration often extending along the proliferated bile ducts was in larger portal triads, especially localized around the lymphatics. The liver parenchyma showed more or less diffuse damage to the liver cells and also focal necroses, which may become rather extensive (fig. 4 *B*). The evidence of biliary stasis varied in individual cases. In later stages the picture may simulate what has been called infectious cirrhosis.[15]

COMMENT

Liver biopsy has not only permitted a better evaluation of the hepatic function tests,[16] but it also has facilitated the clinical differentiation of hepatitis into several forms.

An attempt was made on the basis of morphologic criteria to subdivide primary hepatitis, which before World War II was usually called "catarrhal jaundice," into two groups, virus and toxic. In civilians the etiologic classification is usually difficult because causative agents are not often elicited. In the benign as well as in the fatal cases[9] the morphologic picture of toxic hepatitis was somewhat more commonly found than the virus form. The division of secondary hepatitis into two groups is of value because it emphasizes that in biliary obstruction damage to liver cells may occur early due to purulent inflammation. Some significance may also lie in the fact that the purulent form is suggestive of cholelithiasis, and this may have some value in distinguishing benign from malignant obstruction.

In the differentiation of the various forms of hepatitis, function tests may be of only limited help since damage to liver cells is present in all forms. The functional impairment may vary, depending on the stage of the disease; for example, in biliary hepatitis it may become apparent only with longer duration of the obstruction. In general, therefore, tests for parenchymal damage such as albumin-globulin or cholesterol ester ratios, excretion of hippuric acid, galactose tolerance, response of prothrombin time to vitamin K or plasma vitamin A do not necessarily differentiate the various forms of hepatitis. The cephalin-cholesterol flocculation is of greater value, and less so the thymol turbidity test, since these are only slightly affected, even in later stages of biliary hepatitis. However, one may also find negative cephalin-cholesterol flocculation and thymol turbidity reactions in a fair number of cases of toxic hepatitis, and positive cephalin-cholesterol flocculation and thymol turbidity reactions are often found in purulent hepatitis, which, being a secondary type of hepatitis, has a similar clinical significance to that of the biliary form. The tests for impairment of bile flow help also only to some degree in the distinction of the different forms of hepatitis. Obviously, more may be accomplished by repeated function tests during the course of the disease; e.g., urinary excretion of urobilinogen.[17]

The clinical differentiation between primary (medical) and secondary (surgical) hepatitis is facilitated by the use of the biopsy. The chief difficulty in our experience has been differentiation between toxic and early biliary hepatitis. In addition, occasionally a case may occur in which the morphologic picture does not permit a definite diagnosis. The difficulty in the clinical and functional differentiation of surgical and medical types of jaundice becomes especially apparent in the later stages of extrahepatic obstruction when the parenchymal damage simulates that found in the medical jaundice. It is in those instances that liver biopsy becomes of added importance because the longer the duration of the extrahepatic obstruction, the more characteristic becomes the morphologic picture for biliary hepatitis and the easier it is to differentiate it from virus or toxic hepatitis. The liver biopsy thus aids in the differentiation of intrahepatic obstruction in primary hepatitis from extrahepatic obstruction.

SUMMARY

With the help of liver biopsies, the attempt has been made to divide acute hepatitis into a primary (medical) form and a secondary (surgical) form. The former is further subdivided into virus (infectious) and toxic varieties. The secondary form is subdivided into a biliary (due to extrahepatic obstruction) and a purulent type (due to inflammation in the portal triads). This differentiation is based on pathologic findings in biopsy specimens, and is correlated with the laboratory findings found in the different groups. This classification of hepatitis into four groups helps in the differential diagnosis of jaundice by laboratory methods, especially distinguishing surgical from medical types of jaundice. The diagnosis of intrahepatic biliary obstruction in medical jaundice and its differentiation from extrahepatic biliary obstruction and the recognition of secondary damage to the liver in extrahepatic jaundice are especially facilitated through this approach.

DISEASE OF THE LIVER

A Review of Some Clinical and Biochemical Problems as Revealed by Systematic Biopsy Studies

JOHN McMICHAEL, M. D.
London, England

Needle biopsy of the liver was first performed by Paul Ehrlich about 1883 and since then nearly 2,500 biopsies are on record.[1] Used widely in tropical medicine for the detection of amebic abscesses, it was recently revived for systematic use by Iversen and Roholm,[2] who recorded 160 liver punctures without a death. My associates and I began to use the method in the British Postgraduate Medical School in 1941 with the confidence suggested by Iversen and Roholm's report of its safety and in view of the urgent problems of hepatitis resulting from the war. In our first 150 biopsies we had 2 cases of intraperitoneal hemorrhage leading to death, both patients, however, having a degree of damage to the liver so severe that puncture only accelerated an already certain fatal issue. At that stage, however, we reviewed the technic and changed from a 2 mm. bore to a 1 mm. bore needle, and also decided to use a 5 inch (12.7 cm.) rather than a 3 inch (7.6 cm.) needle so as to take the cylinder of tissue from the depth of the liver rather than run the risk of leaving a bleeding hole on the surface. Since then Dr. Sherlock has carried out a further 250 biopsies with no fatalities. The risk of hemorrhage, however, is still present, and on two occasions transfusions have been required. On one occasion an abnormally placed gallbladder was punctured and the patient had to be operated on forthwith, but he made a good recovery after drainage of Morison's pouch. The technic is described in detail by Dr. Sherlock.[1]

DIAGNOSTIC PROBLEMS

In obscure diseases of the liver and blood the technic gives most valuable information of which the following are examples.

A patient with an enlarged spleen of obscure character in whom sternal marrow biopsy had given no help showed in the liver section large fibrillated cells with eccentric nuclei characteristic of Gaucher's disease.

A man aged 54 with macrocytic anemia and leukopenia refractory to all forms of liver therapy showed increased proliferation of the endothelium of the hepatic sinusoids. The picture most closely resembled the histiocytic medullary reticulosis described by Bodley-Scott and Robb-Smith.[3]

A soldier, aged 28, who had served in the Central Mediterranean Force, returned to England with irregular fever and enlargement of the liver, spleen and lymph nodes. No parasites were seen on sternal or splenic puncture, but liver biopsy showed reticuloendothelial proliferation in the hepatic lobules with characteristic Leishman-Donovan bodies of kala-azar.

A man aged 65 complained of anorexia and loss of weight. Barium meal, etc., failed to reveal an organic cause. Liver biopsy showed a squamous epithelioma. Repeat examination of the esophagus showed an extensive infiltration of the esophagus with carcinoma only visible on the lateral view and causing no obstruction.

A patient with pulmonary tuberculosis had an edematous type of nephritis. The differential diagnosis lay between nephrosis and amyloid disease. The congo red test was inconclusive; liver biopsy showed extensive infiltration with amyloid tissue.

STUDY OF DAMAGE TO THE LIVER AND RECOVERY

In acute hepatitis[4] one encounters the same pathologic pictures, whether the disease be of the ordinary epidemic variety or the result of arsenical or serum inoculations. Perhaps the only difference is that inoculation jaundice tends to be rather more severe. Intense destruction of liver cells with loss of the normal pattern of the liver characterizes the diffuse type of liver damage. So long as the reticulin pattern of the liver is preserved, full recovery and restoration of normal structure may take place. In others, however, the destruction is zonal in type, affecting particularly the periportal and central regions of the lobule. Some condensation of reticulin may occur in the periportal regions, and as the liver cells regenerate this zone cannot be occupied by liver cells and remains a picture of residual periportal scarring and slight bile duct proliferation. This does not constitute true cirrhosis. Such patients have no residual symptoms, and in 1 patient who died of another disease two years after his jaundice these periportal scars, previously seen at biopsy, had practically disappeared. In a very few instances true distortion of the architecture of the liver may take place with the development of cirrhosis. Even such scarred livers, however, are compatible with excellent health or only the mildest feeling of fulness after meals.

In passing I might note that I have seen normal recovery of severe hepatitis in a patient suffering from gross protein deprivation from a gastroileal fistula.

CORRELATIONS OF LIVER DAMAGE WITH HEPATIC FUNCTION TESTS

Dr. Sheila Sherlock[5] has carried out an extensive investigation using certain standard hepatic function tests and nearly simultaneous biopsy controls.

1. *The Hippuric Acid Synthesis Test.*—Synthesis of hippuric acid is impaired rather early in hepatic disease, but it is unfortunately also impaired in other conditions in which the liver on histologic section appears to be completely normal. Poor excretion occurs in cases of renal damage, and it is essential to check the test by running a urea clearance test at the same time. Owing to the absence of any recognizable histologic change in the liver, I feel exceedingly skeptical of the use of the hippuric acid synthesis test in the diagnosis of impaired hepatic function in such conditions as diabetes and rheumatoid arthritis.

2. *Bilirubin and Serum Alkaline Phosphatase.*—In obstructive jaundice serum phosphatase is raised up to 90 King-Armstrong units, and is seldom below 30 units. In hepatitis, however, it is seldom above 30 units. This is a most valuable aid in the differential diagnosis of obstructive jaundice from hepatitis.

Cases of hepatitis were subdivided into various grades of severity according to the number of surviving liver cells in each lobule as follows:— grade A, 75 to 100 per cent liver cell survival; grade B, 50 to 75 per cent; grade C, 25 to 50 per cent, and grade D, under 25 per cent. It was found that the depth of the jaundice was closely correlated with the severity of the damage to the liver cells. Phosphatase levels did not differ significantly in the various grades.

3. *Galactose Tolerance Test.*—We have used the time of disappearance from the blood of an injected dose of galactose (0.5 Gm. per kilogram of body weight: normal average, 60 minutes; range, 30 to 90 minutes). In grade A hepatitis the galactose time is not impaired. In grade B hepatitis it is usually about the upper range of normal, while in grades C and D significant impairment is the rule. Excretion of hippuric acid, on the other hand, is impaired early but gives no index of the severity of damage to the liver in the more severe grades.

The albumin-globulin ratio falls in grade C and is usually reversed (below 1) in grade D.

POSTHEPATITIS SYNDROME

Dr. Sherlock and Miss Walshe[6] have carried out extensive investigations on a number of patients with the posthepatitis syndrome sent by the military authorities. In practically all instances the livers have been histologically normal, and we have formed the impression that these patients are mostly suffering from a "hepatic neurosis." In few instances does there seem to be permanent damage to the liver after hepatitis.

OBSTRUCTIVE JAUNDICE

The sequence of events is being followed in a large series of cases of obstructive jaundice.[5a] Bile thrombi accumulate in the bile canaliculi within the lobule, mainly in the central zones. Sooner or later the surrounding liver cells may degenerate in a focal fashion, and then one sees an area of bile necrosis. The bile ducts in the portal tracts proliferate with swollen epithelium, and a little periportal scarring may also develop. It is important to keep this picture in mind, as the histologic picture may closely resemble that seen in recovering hepatitis with residual periportal scarring. In the early days of our work we made at least one mistake in diagnosis of a biopsy specimen from failure to differentiate between these two pictures.

CONCLUSION

Aspiration liver biopsy seems now to have a diminishing risk and, provided it is carried out in hospital with strict preparations (1) to prevent the possibility of bleeding in a jaundiced patient and (2) to transfuse in the rare instances in which bleeding may occur, it is justified as a helpful procedure in obscure diagnostic problems when there is reason to suspect that the liver may be involved pathologically.

As an instrument of research it will yield much further information, as biochemical estimations of glycogen and histochemical and cytologic technics may also be applied to the fragments of tissue obtainable. As time goes on one may expect this method to be a source of further light on problems of pathologic changes and function of the liver in blood and metabolic diseases.

THE ACCURACY OF DIAGNOSIS OF JAUNDICE

WILLIAM F. LIPP, M. D.
ALFRED R. LENZNER, M. D.
and
A. H. AARON, M. D.
Buffalo

The primary responsibility in the management of the patient with jaundice is the decision whether or not to operate. In relation to this question all other factors are secondary in importance. Most of the more recent publications emphasize methods of diagnosis. In large part these methods are laboratory procedures and are clinical applications of the known physiology of the liver. These "batteries" and "profiles" of hepatic function include a multitude of tests which a clinician or general practitioner must attempt to evaluate. It is well known that one test has little value; a number must be employed if the total functional status of the liver is to be measured. It is difficult for the practicing physician to know what tests he should use and how the results should be interpreted. Unfortunately, too, this emphasis on laboratory procedure tends to depreciate the value of history taking and careful physical examination, and symptoms and signs become relegated to an inferior position. It is reassuring to know that not infrequently problems in diagnosis are encountered by the gastroenterologist and clinical investigator who have available an abundance of hepatic function tests, as well as the practitioner who is so often called on to establish his diagnosis through bedside observation with a limited number of tests.

It is true that in the majority of patients with jaundice resulting from disease of the pancreobiliary tract, the nature and site of the causative lesion can be rather readily determined through the interpretation of the clinical picture, and the accepted treatment, surgical or medical, can be instituted. For instance, the onset and course of infectious hepatitis in young persons is most often quite clear. The clinical picture of portal cirrhosis usually has a typical pattern. The story of severe pain in the right upper quadrant followed by jaundice, with a history of previous attacks, in a woman of middle life or beyond indicates the presence of cholelithiasis with great reliability. The symptoms and signs of neoplastic obstruction may produce a less well defined clinical picture; yet frequently the course is characteristic. These diagnoses are made on firm clinical grounds and can be supported by easily acquired laboratory evidence.

However, unfortunately, every one has encountered a small but definite group of jaundiced persons in whom diagnosis resists the usual investigative methods. These persons are usually 40 years of age and older; the history is not typical; the physical findings do not conform, and the results of laboratory procedures may be misleading. Often pain is absent; frequently the jaundice is either prolonged or recurrent. After a period of observation, because of insecurity of diagnosis, exploratory laparotomy is suggested to avoid overlooking a stone in the common duct or new growth.

If it is accepted that the primary responsibility in the management of the jaundiced patient is to decide whether the treatment should be medical or surgical, it is practical to employ a classification which possesses these therapeutic indications. Thus one can divide jaundice (due to disease of the pancreobiliary tract) on a therapeutic as well as anatomic basis into intrahepatic jaundice and extrahepatic jaundice:

I. Intrahepatic jaundice
    1. Hepatocellular jaundice, parenchymal jaundice, etc.
    2. Infectious hepatitis, dystrophies, cirrhoses
    3. The treatment is medical
II. Extrahepatic jaundice
    1. Mechanical obstruction of the common bile duct
    2. Carcinoma, common duct stone, stricture
    3. The treatment is surgical

Intrahepatic jaundice includes all those lesions within the liver (it is frequently referred to as hepatocellular jaundice or parenchymal jaundice) such as infectious hepatitis, the dystrophies and cirrhoses. Here the treatment is medical.

Extrahepatic jaundice refers to those lesions which produce mechanical obstruction of the common bile duct below and beyond the liver (it is commonly called obstructive jaundice) such as common duct stone, new growths and stricture. Here the treatment is surgical, whether it be for cure or palliation.

In this study we have examined the experience of a general hospital in the management of jaundice. The purpose was to attempt to define the limitations of diagnostic methods through a frank appraisal of the degree of accuracy of diagnosis. The findings should reflect the experience of hospitals throughout the country at the general hospital level—the level at which a significant portion of the population is served.

MATERIAL AND METHOD

The records of 412 patients admitted to the Buffalo General Hospital during the period 1936 to 1946 with the presenting sign of icterus were reviewed. The patients were admitted on various services such as medicine, surgery and pediatrics, both ward and private room; and consequently a number of physicians and surgeons shared in their management. For this analysis,

---

From the Department of Medicine of the University of Buffalo and the Buffalo General Hospital. [illegible] of the Liver before the Section on [illegible] the Ninety-Sixth Annual Session [illegible] Atlantic City, N. J., June 11, 1947.

first choice diagnoses were used in all instances. In each case the causative lesion was within the pancreobiliary tract; patients with hemolytic jaundice were excluded from the study. In most instances, the diagnosis was confirmed through surgical intervention, biopsy or postmortem examination. However, in the majority of cases of infectious hepatitis and in some cases of cirrhosis, the diagnoses were necessarily clinical.

The distribution of cases is shown in table 1.

TABLE 1.—*Distribution of Cases*

	Number	Percentage
A. Intrahepatic jaundice	175	42.5
1. Hepatitis—60		
2. Cirrhosis—91		
3. Dystrophy—24		
B. Extrahepatic jaundice		
1. Calculus	152	36.9
2. Carcinoma of pancreas	63	15.3
3. Biliary carcinoma*	15	3.6
4. Stricture	7	1.7

*The designation biliary carcinoma refers to malignant lesions other than neoplasms of the pancreas, such as carcinoma of the gallbladder, carcinoma of the bile ducts and metastatic carcinoma.

RESULTS

A. Analysis of Series.—An erroneous diagnosis (between intrahepatic jaundice and extrahepatic jaundice) was made in 16 of the 412 cases, an error of 3.8 per cent as shown in table 2.

TABLE 2.—*Errors in Four Hundred and Twelve Cases*

	Cases	Percentage
Intrahepatic vs. extrahepatic	16	3.8
Among extrahepatic group	7	1.6
Need for laparotomy	26	6.3

In 7 cases (1.6 per cent) a wrong diagnosis among the three common types of extrahepatic jaundice (stone in the common duct, carcinoma, stricture) was made, although the presence of extrahepatic obstruction was recognized.

In 26 cases (6.3 per cent) surgical exploration was performed to obtain a final diagnosis. This figure, of course, includes some of the erroneous diagnoses.

In addition there were in the extrahepatic group 13 cases of carcinoma arising elsewhere than the pancreas or ampulla, such as carcinoma of the bile ducts, carcinoma of the gallbladder and metastatic carcinoma. These were diagnosed either carcinoma of the pancreas or, more broadly, "biliary tract carcinoma." It does not seem fair to classify these as errors, inasmuch as the presence of extrahepatic malignant obstruction was recognized.

We were surprised and disturbed by this high degree of accuracy of diagnosis (approximately 90 per cent). It is accounted for in part by the large number of cases of infectious hepatitis in young age groups, the many instances of portal cirrhosis with a typical clinical picture and the large group of patients with a stone of the common duct with a characteristic history. Ease of diagnosis in typical cases is self evident, and fortunately this large group will include the great majority of patients encountered in private and hospital practice.

B. Comparison of Two Groups of Patients.—The series of 412 patients was divided into two time periods, the first consisting of patients admitted during the five year period 1936 to 1940 (162 cases) and the second consisting of those patients studied during the six year period 1941 to 1946 (250 cases). During the first period the diagnoses were based almost entirely on the interpretation of symptoms and signs with a limited use of technical procedures, while in the second period a number of laboratory procedures were employed in addition to bedside observation such as determinations of the plasma proteins, prothrombin and its response to menadione, sedimentation rate, alkaline phosphatase, cephalin cholesterol flocculation test, thymol turbidity test, roentgenographic examination of the duodenum and needle biopsy, as well as the usual routine laboratory studies.

The results of the comparison of these two groups of patients are shown in table 3.

TABLE 3.—*Comparison of Errors in Two Periods*

	1936-1940 (162 Cases)		1941-1946 (250 Cases)	
Type of Error	Number	Percentage	Number	Percentage
Intrahepatic vs. extrahepatic	10	6.1	6	2.4
Among extrahepatic group	2	1.2	5	2.0
Need for laparotomy	12*	7.4	14*	5.6

*This figure includes erroneous diagnoses, unless early death occurred.

There is a decided improvement in the degree of accuracy of diagnosis between intrahepatic jaundice and extrahepatic jaundice, with a decline in error from 6.1 per cent to 2.4 per cent.

There is little change in the number of errors among the various lesions which produce extrahepatic jaundice (1936 to 1940, 1.2 per cent; 1941 to 1946, 2.0 per cent).

There was a slight but significant decrease in the number of patients requiring surgical intervention to obtain a secure diagnosis (1936 to 1940, 7.4 per cent; 1941 to 1946, 5.6 per cent).

It is not likely that a single reason will explain this improving rate of accuracy of diagnosis. A number of factors are responsible. Review of the records with a comparison of the two periods demonstrates more intensive and thorough clinical study during the later period as evidenced by careful histories and physical examinations with repeated observations made over a longer period of time. The studies accorded patients in the earlier period were brief and inadequate in many instances, and it seemed that frequently surgical exploration was advised before complete observations had been made. Another factor is certainly the increasing employment of laboratory procedures for purposes of confirmation. Unfortunately, as originally hoped, the separate contribution made by various hepatic function tests could not be assessed.

C. Accuracy of Diagnosis in Specific Lesions.—The rate of accuracy of diagnosis in each of the various pancreobiliary lesions which produce jaundice is shown in table 4.

TABLE 4.—*Accuracy of Diagnosis in Common Lesions**

Lesion	Correct Diagnosis Number	Correct Diagnosis Percentage	Incorrect or Laparotomy Number	Incorrect or Laparotomy Percentage
Intrahepatic (175)	153	87.4	22	12.6
Calculus (152)	147	96.7	3	1.9
Carcinoma of pancreas (63)	57	90.4	3	4.8
Biliary carcinoma (15)	13	86.6	1	6.6
Stricture (7)	6	85.7	0	0

* There were 2 cases of calculus, 3 cases of carcinoma of the pancreas, 1 case of carcinoma of the biliary tract and 1 case of stricture, in which another extrahepatic lesion was selected, accounting for the failure of some groups to total 100 per cent.

In 175 cases of intrahepatic jaundice, the diagnosis was correct in 153 (87.4 per cent). If this group were further broken down it would be found that as a rule the cases of infectious hepatitis and portal cirrhosis were rather readily diagnosed; while in the group of dystrophies, where bizarre clinical pictures were likely to occur, more errors were made.

In 152 cases of stone in the common duct, the correct diagnosis was made in 147 (96.7 per cent). This lesion usually produces a characteristic clinical picture. In this group typical biliary colic occurred in 84.9 per cent, pain of moderate intensity in 9.2 per cent, while there were 5.9 per cent of so-called silent stones. Moreover, 76.9 per cent of patients gave a history of one or more previous episodes of colic, and, of these episodes, 36.7 per cent were associated with jaundice.

In 63 cases of carcinoma of the pancreas or ampulla, a surprisingly high rate of accuracy occurred, 57 cases, or 90.4 per cent, being diagnosed correctly. Again the clinical picture was of primary value. It might be mentioned that in contradistinction to recent reviews, the majority (58.7 per cent) of patients presented the picture of painless, progressive jaundice. Pain of varying degree was present in 41.3 per cent of patients. Of these, it was severe, simulating biliary colic, in 7.9 per cent; in 17.5 per cent there was moderate pain; in 15.9 per cent distress alone was described. In 7 patients (26.9 per cent) with pain, there was radiation through to the back, "boring" in nature.

In 15 cases of carcinoma of the biliary tract arising elsewhere than the pancreas or ampulla, such as carcinoma of the bile ducts, carcinoma of the gallbladder and metastatic carcinoma, the lesion was designated malignant in 13 (86.6 per cent), being called either carcinoma of the pancreas or broadly "biliary tract carcinoma." In 80 per cent of these it is significant that pain was absent, and the course was progressive. And if these cases are added to the group of carcinoma of the pancreas and ampulla, it is found that there was no pain in 64 per cent of patients with malignant obstruction.

In the 7 cases of stricture of the common bile duct the extrahepatic nature of the lesion was recognized, although in 1 the diagnosis of stone in the common duct was made.

So, of all cases of intrahepatic jaundice (175), the diagnosis was correct with no need for laparotomy in 153 (87.4 per cent). Surgical intervention was necessary in 19 cases (10.8 per cent), while 3 patients (1.8 per cent) died with acute necrosis.

If all cases of extrahepatic jaundice (237) are considered as a group, the diagnosis was correct (although a wrong lesion was selected in 7 cases) in 230 (97 per cent) and erroneous in 3 (3 per cent).

D. Analysis of Erroneous Diagnoses.—The erroneous diagnoses between intrahepatic jaundice and extrahepatic jaundice are listed in table 5.

TABLE 5.—*Sixteen Incorrect Diagnoses in Four Hundred and Twelve Cases*

Number	Original Diagnosis	Final Diagnosis
2	Undiagnosed	Intrahepatic jaundice
7	Calculus	Intrahepatic jaundice
3	Intrahepatic jaundice	Calculus
2	Intrahepatic jaundice	Carcinoma of pancreas
1	"Unexplained jaundice"	Carcinoma of pancreas
1	"Unexplained jaundice"	Biliary carcinoma

The most frequent error was that of diagnosing intrahepatic jaundice as stone in the common duct. This occurred in 7 patients, each of whom was submitted to operation; the final diagnosis was then established. These patients had pain of either severe or moderate intensity; several had chills, and all were in middle life or beyond. This error becomes less important in view of the advances in preoperative and postoperative care (selection of anesthetic agent, use of protective diet, administration of menadione and adequate fluids and blood).

The most serious error was that of diagnosing 5 extrahepatic lesions such as stone in the common duct and carcinoma of the pancreas as intrahepatic jaundice. In addition there were 2 cases of "unexplained jaundice" in which laparotomy was recommended. In these 7 cases error involved the life of the patient. Fortunately, despite clinical and laboratory evidence which favored the diagnosis of intrahepatic jaundice, surgical exploration was urged, and either curative or palliative measures were attempted.

E. Need for Surgical Exploration.—When this series of 412 patients is considered from the point of view of need for exploratory laparotomy, it is found that (exclusive of the patients dying within a few days following admission) there were 26 cases in which operation was required before a conclusive diagnosis between intrahepatic jaundice and extrahepatic jaundice could be established, or 6.3 per cent of patients, as shown in table 6.

TABLE 6.—*Need for Laparotomy*

Number of Cases	Final Diagnosis
19	Intrahepatic jaundice
3	Stone in common duct
3	Carcinoma of pancreas
1	Biliary carcinoma
26 Cases, or 6.3%	

In 13 of these cases the diagnosis had not been made or was erroneous.

In 13 the diagnosis was intrahepatic jaundice, but operation was deemed necessary to exclude a possible extrahepatic lesion such as stone or new growth. In this group of patients the jaundice was either prolonged or recurrent; pain was absent or slight, and the presence of a "silent" stone in the common duct could not be excluded with security.

As has been already noted, although the group with intrahepatic jaundice (19 cases) constitutes the more frequent problem, it is the group with extrahepatic lesions (7 cases) that is the more important from the point of view of life.

F. The Erroneous Diagnoses as a Group.—Analysis of the records of those patients in whom erroneous diagnoses were made reveals that 14 of the 16 patients were 40 years of age and older, with unusual clinical pictures as well as misleading results from laboratory procedures. Either the course was prolonged or the jaundice recurrent. Of the 2 patients younger than 40 years, one had a stone in the common duct and the other carcinoma of the head of the pancreas.

COMMENT

Although much progress has been made toward understanding the mechanisms of jaundice resulting from disease of the pancreobiliary tract, at the present state of our knowledge it will serve the best interests of the patient to employ a classification that has clinical value. The use of the terms intrahepatic jaundice and extrahepatic jaundice implies the ultimate problem of the jaundiced patient—the question of the need for operation—for one is a medical disease, while the other has surgical implications.

Fortunately, in the majority of patients a correct diagnosis will be arrived at through evaluation of the clinical picture. Recently the significance of such factors as age, sex, duration and depth of jaundice, pain, chills and fever, history of previous attacks, digestive symptoms, use of alcohol and exposure to other hepatotoxins, splenomegaly, palpable gallbladder, angioma, ascites and color of the stool was reemphasized.[1] It was noted that the clinical picture is most reliable in cases of stone in the common duct, infectious hepatitis in younger age groups and portal cirrhosis. Its value is somewhat less in carcinoma involving the biliary tract, while it appears least reliable in various of the hepatic dystrophies. As is well known, the symptom pain alone is exceedingly valuable. However, while 94 per cent of patients with stone in the common duct had pain of some degree, it is the 6 per cent of patients with painless jaundice who make differential diagnosis difficult. Evaluation of the other clinical factors reveals similar variations which increase the difficulty of diagnosis in the individual patient.

---

[1] Lipp, W. F.; Lenzner, A. R., and Aaron, A. H.: The Value of Symptoms and Physical Signs in the Differential Diagnosis of Jaundice, New York State J. Med., to be published.

Furthermore, in reviewing the present series of jaundiced patients, the limitations of laboratory procedures were again evident. For example, 35 per cent of patients with carcinoma of the pancreas had incomplete obstruction as indicated by brown stools and the presence of urobilinogen in the urine, a surprisingly high figure. Normal protein levels were present in 14.7 per cent of patients with portal cirrhosis, while abnormal values were found in 7.6 per cent of patients with neoplastic obstruction. The prothrombin response to menadione was good in 37.8 per cent of cases of intrahepatic disease and poor in 18 per cent of cases of extrahepatic obstruction. The result of the cephalin-cholesterol flocculation test was negative in 19.5 per cent of cases of intrahepatic lesions and 3 to 4 plus in 3 per cent of cases with extrahepatic obstruction. The limitations of hepatic function tests as well as the factors which restrict their value are well known.[2] Unless the results are interpreted by the clinician in the light of the clinical picture, they may lose what value they possess. Hepatic function tests may be used to support a clinical impression but not to make a diagnosis.

As a result of these discrepancies, present both in the clinical picture and in the results of the usual laboratory aids, an accurate differentiation between intrahepatic and extrahepatic jaundice will be exceedingly difficult in a small number of cases. Certainly a better understanding of the clinical entity known variously as intrahepatic obstructive jaundice [3] or cholangiolitic hepatitis,[4] in which intrahepatic disease is associated with obstructive features, will help to resolve a portion of this difficult group of cases. However, if surgically remediable extrahepatic lesions are not to be overlooked, laparotomy must be performed in those patients in whom there is reasonable doubt as to the nature and site of the lesion producing the jaundice. In the present series of 412 patients there were 26 instances in which operation was required because of uncertainty of diagnosis.

CONCLUSION

A study was made of the records of 412 patients admitted to a general hospital with the presenting sign of jaundice. In approximately 90 per cent of cases the correct diagnosis was made through evaluation of the clinical picture. In the majority of instances the results of the usual laboratory procedures supported the clinical impression. However, there remained a small group of patients of middle age and beyond in whom the clinical picture was atypical, the jaundice prolonged or recurrent and the laboratory evidence inconclusive. Exploratory laparotomy was necessary in these patients because of insecurity of diagnosis and in order to avoid overlooking a possible extrahepatic lesion susceptible to surgical attack.

EFFICACY OF LIPOTROPIC SUBSTANCES IN TREATMENT OF CIRRHOSIS OF LIVER

FREDERICK STEIGMANN, M.D.
Chicago

The effectiveness of choline in removing fat from the liver was first described fifteen years ago by Best and his co-workers.[1] Shortly thereafter other substances were found to have similar lipotropic activity, among them being casein,[2] an amino acid (methionine) [3] and yeast.[4] In animal experiments it was demonstrated that choline not only removes fat but also seems to arrest the cirrhotic process.[5]

Encouraged by results of animal experiments which demonstrated the effect of specific lipotropic substances on the production of cirrhosis on the one hand [6] and on the arrest [5b] and prevention of cirrhosis on the other,[7] many clinicians started to apply the physiologic principles learned from these animal experiments to human sufferers of cirrhosis.

This year marked the tenth anniversary of Pátek's first paper on the treatment of cirrhosis by a high protein and high vitamin regimen,[8] a regimen which signified the first methodical approach to the study and management of the cirrhotic patient.

Various workers, shortly thereafter, confirmed Patek's original observation on their patients with cirrhosis. Some of these used strictly Patek's dietary regimen while others modified the procedure as to type of protein, vitamins, etc.[9] In recent years the Patek regimen of cirrhosis patients was further modified by the addition of specific lipotropic substances

such as choline, choline and cystine, and methionine.[10]

Ten years have passed since the advent of the new *regimen for cirrhotic patients; hence it was thought* timely to compare the results of the different types of treatment of cirrhosis as observed in our clinic.

MATERIAL AND METHOD

During the ten years my associates and I have observed 247 cases of cirrhosis of the liver. These cases were divided into three groups. The first group consisted of 81 patients who were treated between the years of 1937 and 1940. These patients received a routine medical treatment that consisted of a diet high in carbohydrates (350 to 500 Gm.) and low in fat and proteins. Many of them received, additionally, dextrose intravenously in a 5 or 10 per cent solution.

TABLE 1.—*Clinical Data in the Three Groups of Cases of Cirrhosis*

	Patients on High Carbohydrate and Average Fat Diet	Patients on High Caloric, High Protein, High Vitamin and Low Fat Diet	
		Without Specific Supplements	With Methionine or Cystine and Choline Added
Number of patients	81	119	47
Average age	47	50	46
Sex Male	63	90	30
Female	17	29	17
Alcoholic history	63	97	42
Duration of disease Less than 1 yr.	70	84	26
before hospitalization Over 1 yr.	11*	35†	21‡

*One patient had symptoms for five years; 2 for six, and 1 for eight years.

†Two patients had symptoms for five years; 3 for six; 1 for eight; 1 for ten; 1 for fifteen, and 1 for twenty-eight years.

‡Two patients had symptoms for five years and 2 for ten years.

The second group consisted of 119 patients who were treated from 1941 to date. They received a diet high in carbohydrates (350 to 500 Gm.); high in proteins[11] (100 to 150 Gm.) and low in fat (approximately 50 to 70 Gm.). In addition they received large doses of vitamin supplements.

The third group consisted of 47 patients who were treated since 1943. These patients were on a regimen essentially like those of group 2, but received one type of a lipotropic substance (cystine and choline[12] in doses of 3 Gm. [25 patients], 3 Gm. of choline[12] alone [12 patients] or 3 to 5 Gm. of methionine[12] daily [10 patients]).

The patients in all three groups represented on the whole a similar class of persons as is usually seen in a charity hospital. The average age and sex distribution was fairly close in all three groups, although there was a definitely higher incidence of cases among females in the past few years. The duration of the disease prior to entrance was also within similar time ranges, varying usually from weeks to months (table 1). There was, however, a small percentage of patients in each group in whom symptoms similar to the ones presenting themselves at entrance had been present, intermittently or constantly, for one or more years previously. (8.6 per cent, 14.2 per cent and 21.2 per cent, respectively.) In some patients a history of previous disease of the biliary tract with or without jaundice was obtained (in 4.9 per cent, 15.5 and 8.5 per cent of the three groups, respectively). A history of ingestion of alcoholic beverages was obtained in the majority of cases, with the percentages rising in recent years.

The physical findings on which the diagnosis of cirrhosis was made on initial examination presented themselves fairly comparably in all three groups also. Thus, the incidence of large livers, jaundice, splenomegaly and ascites was rather similar (table 2).

TABLE 2.—*Percentage of Abnormal Physical Findings in the Three Groups of Patients with Cirrhosis*

	Patients on High Carbohydrate and Average Fat Diet	Patients on High Caloric, High Protein, High Vitamin and Low Fat Diet	
		Without Specific Supplements	With Methionine or Cystine and Choline Added
Number of patients	81	119	47
Jaundice	77.5	63.8	70.2
Ascites only	15.0	20	14.7
Enlarged liver only	22.5	31.1	25.1
Ascites and large liver	56.2	45.3	60.0
Splenomegaly	17.5	12.6	27.6

All patients had a battery of hepatic function tests performed at the start of the treatment and at variable intervals (two to four weeks) thereafter.

In 10 patients, 2 of group 2 and 8 of group 3, the clinical observations were checked morphologically by liver biopsies on specimens obtained by aspiration.[13] Of the 8 patients of group 3, 2 received the diet high in protein and vitamin supplements plus methionine as the lipotropic substance while 6 received cystine and choline as the specific factor.

RESULTS

The 81 patients of the first group were under treatment in the hospital from a minimum of seven to a maximum of two hundred and ten days with an average of thirty-seven days. Forty-one of them died some time during this observation period, while 40 recovered sufficiently to leave the hospital; i.e., they had improved regarding either their subjective or objective symptoms or both. Disappearance or decrease of ascites or edema, increase in intervals between paracenteses, disappearance of jaundice, decrease in size of the liver and improvement in the results of the hepatic function tests were considered signs of objective improvement. A better appetite, gain in weight (while not edematous or ascitic) and gain in strength were subjective signs of improvement.

Of the 40 patients who were discharged after the first admission, 26 were not seen thereafter, while 14 (35 per cent) reentered the hospital after an interval of one week to four years. Six of the 14 returned patients died after their second admission to the hospital, which occurred from three weeks to nineteen months after their first discharge from the hospital. Eight of the patients again recovered sufficiently to leave the hospital. Of these, 2 died on subsequent readmissions (one during the third, eight months later, and one during the fourth admission, nine months later). The remaining 6 patients were seen at various intervals, until 5 of them became lost also after observation periods ranging from seven months to three and one-half years. One died only recently, after a total observation period of almost ten years.

[11] The earlier patients (1941 to 1943) received protein of lactovegetarian origin.

[12] This was provided by Wyeth Incorporated, Philadelphia.

[13] Drs. H. Popper and M. Franklin reported on the histologic findings and Dr. D. D. Kozoll performed the biopsies.

The 119 patients comprising the second group were under care in the hospital from a minimum of one day to a maximum of 150 days. Of the 78 patients of subgroup (a), who were observed in the earlier part of this study (1941 to 1943), 25, or 32 per cent, died during the first hospital stay, while 53, or 68 per cent, recovered sufficiently to leave the hospital. Of these 53 patients 15, or 28 per cent, returned subsequently for hospitalization one to four times during the following year (three weeks to one year). Nine (60 per cent) of these 15 patients died during one of these readmissions to the hospital. The remaining 44 patients of this earlier group gradually ceased coming to the clinic, so that at present the fate of only 1 patient is known, who happens to be well and working hard nearly four years after his first admission to the hospital.

Table 3.—*Morbidity and Mortality of the Three Groups of Patients with Cirrhosis*

Group	Treatment (Diet)	Number of Cases	Initial Hospitalizations: Number		Repeat Hospitalizations: Number			Duration of Observation	Cases still Observed	Cases Lost	Total Died	Percentage Who Died
			Died	Recovered	Returned	Died	Recovered					
1	High carbohydrate	81	41	40	14	9	5	Up to 4 yr.	0	31	50	61.7
II A.	High protein (lactovegetarian), low fat, vitamin supplements	78	25	53	15	9	6	Up to 6 yr.	1	43	34	43.5*
B.	High protein (meat), low fat, vitamin supplements	41	18	23	8	4	4	Up to 3 yr.	6	13	22	53.6*
III	High protein, low fat, vitamin supplements and lipotropic substances	47	6	41	20	10	10	Up to 3 yr.	11	20†	16	34

*The combined mortality for group 2 is 47 per cent.

†Two patients are in a convalescent home.

Of the 41 patients of subgroup (*b*), who were treated since 1944, 18 (44 per cent) died during the first stay in the hospital, while 23 recovered sufficiently to leave the hospital. Eight (34.8 per cent) of these 23 patients have returned one or more times for hospitalization during a period from one month to one year. Four of them died during one of these readmissions (2 during the first and 1 each during the second and third hospital stay, respectively). One is at present in the hospital. Of the remaining 18 patients, 5 come regularly to the clinic and show definite arrest of their condition, with slow but gradual improvement. The other 13 patients have not been seen at the clinic or in the hospital since their discharge—a period varying from four to fifteen months.

The 47 patients of the third group who received lipotropic substance in addition to their basic diet were, on the average, under hospital observation for a slightly longer time because most of them received the methionine or cystine and choline for at least four weeks before repeat studies were made on them. Of these 47 patients 6 (12.7 per cent) died during the first period of hospitalization, while 41, or 87.2 per cent, recovered sufficiently to leave the hospital. Of the 41 patients, 20, or 48.7 per cent, were readmitted at variable intervals to the hospital, 10 of them dying during these later admissions. Of the 31 surviving patients of this group, 2 are in a convalescent home, 18 are lost and the remaining 11 are under observation. Of these latter patients, 6 have been able to return to their previous occupation, while the remaining 5, although improved to various degrees both subjectively and objectively, still are below par, being able to perform only part of their previous tasks (table 3).

The 10 patients who were checked morphologically revealed disappearance of fat from the liver, while fibrosis, whenever present, was apparently unaffected.

COMMENT

The evaluation of any therapy of cirrhosis must take into consideration spontaneous remissions and irreversible stages of the disease. Nevertheless, there is a difference in results between the ancient high carbohydrate and the more recent high protein treatment as expressed in the lowering of mortality, decrease in morbidity and almost complete recovery, for the present at least, in a higher percentage of cases. It appeared, moreover, that the addition of specific lipotropic substances to the high protein dietary regimen has further improved the outlook of patients with cirrhosis.

The reports from various clinics in different geographic locations have been uniformly enthusiastic about the results of specific therapy (choline, methionine, choline and cystine) in cirrhosis.[10] Most workers, however, including Patek himself,[14] called attention to apparent therapeutic failures. It seems that the results are more favorable in the presence of a large liver (which indicates mainly fatty infiltration rather than fibrosis) than of a small one.[10g] Furthermore, the presence of ascites decreases the therapeutic effects, which, too, would suggest that pronounced fibrosis in the liver as manifested by portal hypertension is not likely to be influenced by these substances.[15]

Because of the comparatively small number of patients (47) that received lipotropic substances, no attempt has been made to break down this group into smaller divisions according to the lipotropic substances which they received.

From these observations and from special studies on individual patients it appears to us that one is not justified in concluding that all the specific lipotropic substances are identical in their effect, or that the only effect of these substances, especially methionine, is lipotropic. I can just reemphasize the fact that on the basis of the still comparatively short period of observation in a small series of cases, the addition of lipotropic substances (choline alone, choline and cystine, or methionine) enhances the beneficial effects of the high protein and high vitamin regimen. Moreover, while the clinical finding of decrease of the size of the liver and the morphologic finding of disappearance of fat from the liver after administration of these substances suggests a primary action of fat removal, many patients show other beneficial results during this regimen which apparently are not solely due to removal of fat. While some believe that fatty infiltration is the sole source in the production of cirrhosis,[10a] there are others[16] who do not feel that deposition of fat deserves absolute priority in it. The latter may be somewhat supported by our own observation that enlarged livers were found both in the patients who responded and those who did not respond to lipotropic substances. Thus, of the patients who died during their treatment with lipotropic substances, 83.2 per cent had enlarged livers, while of those who recovered, 78.8 per cent had hepatomegaly.

---

[14] Patek, A. J., Jr.: The Dietary Treatment of Laennec's Cirrhosis, New York State J. Med. 46:2519, 1946.

[15] Fleming and Snell.[9] Morrison.[10d]

The sooner patients with cirrhosis receive intensive therapy, the better is their chance of improvement and eventual recovery. For the time being, however, we do not feel that our observations justify the conclusion that this recovery is mainly due to the fact that in the early stages the liver is primarily fatty and not fibrotic. It is nevertheless reasonable to conclude that on the basis of the known activity of lipotropic substances, patients who come under treatment before fibrosis has set in may have much better results from therapy with lipotropic substances than those who are seen later in the course of the disease when fibrosis has developed.

The patients in whom intensive therapy with lipotropic substances failed to result in recovery are obviously of great interest. The question arises whether this was due to the advanced stage of the condition or to other inherent difficulties of any therapy, or whether these cases possibly represented a different pathologic entity. From the observation of our small group of patients receiving lipotropic substances it can be stated that, if advanced stage is measured by duration of symptoms prior to entrance into the hospital, then it did not govern the response or nonresponse to treatment. Patients with symptoms of years' duration did better in some instances than those with symptoms of only several weeks. Thus of the 6 patients who died during their first hospitalization, 5 had symptoms of less than six months. However, if advanced stage is measured by the presence or absence of ascites, then it does influence the response to therapy.

Finally, failure of lipotropic therapy in cases of cirrhosis may be due to the underlying difference in the causal factors. While it is generally accepted that cirrhosis of the liver is a disease produced by deficient intake of various substances and that alcoholism plays only a conditioning role in many instances, it is nevertheless agreed that these factors are not the only ones leading to production of cirrhosis. Cirrhosis may occur in patients who do not drink, have no history of deficient food intake, but who have had acute hepatitis at some time in the past.[17] It is not unlikely, therefore, that patients with cirrhosis who do not respond to the present intensive therapy with specific lipotropic substances may represent a type of cirrhosis not on a deficiency basis. It is therefore believed that the histopathologist will have to differentiate the types of cirrhosis more specifically before it will be possible to evaluate more definitely the efficacy of the lipotropic substances in the treatment of cirrhosis.

SUMMARY AND CONCLUSION

Two hundred and forty-seven cases of cirrhosis were observed during a period of ten years on three different therapeutic regimens.

The most recently used regimen, which consisted of a diet high in protein, high in vitamins, high in carbohydrates and low in fats supplemented by specific lipotropic substances (choline, choline and cystine, and methionine) proved to be the most efficacious, as evidenced by lower mortality and morbidity rates. There was also a higher percentage of recoveries under this regimen.

The results of therapy in all groups seemed to be definitely influenced by the presence or absence of ascites, little by the duration of the disease, as obtained from the history.

While basically the effect of therapy with lipotropic substances is considered to depend on the activity of these substances regarding fat removal, clinically one notices additional beneficial results.

Removal of fat from the liver, as noted morphologically in a few cases by liver biopsies and in many others by decrease in the size of the liver, is not always associated with other objective and subjective signs of improvement.

There exists a significant number of patients with cirrhosis who do not respond to lipotropic therapy. In many of these there seems to be some other underlying cause for the production of the cirrhosis than the previously generally accepted cause of nutritional deficiency conditioned by alcoholism.

ABSTRACT OF DISCUSSION

ON PAPERS OF DRS. MCMICHAEL; LIPP, LENZNER AND AARON; POPPER AND FRANKLIN, AND STEIGMANN

Dr. Cecil J. Watson, Minneapolis: In approaching this problem for a number of years now, I have found help in starting on a fundamental basis, namely, the classification of these into two main types of jaundice: retention jaundice, characterized by an accumulation in the blood of delayed or indirect reacting serum bilirubin, and by the absence of bilirubin in the urine—and I should like to pause for just a moment to say I think it would be well if we could abandon the use of the term "direct" in relation to the van den Bergh reaction. It is misleading because it includes both "prompt" and "delayed," which, in my opinion, have quite different significance. I believe it is better to speak simply, of the prompt and the total bilirubin, the prompt being that reacting with the diazo reagent within one minute, the total that obtained by the method of Malloy and Evelyn. I can testify to everything that Dr. McMichael said about the value of liver biopsy generally. It has been of the greatest help to my associates and me. I am concerned, however, with the enthusiasm with which liver biopsy has been taken up in the country. I understand, rather through the grapevine, that some institutions have already abandoned it because of the mortality. I understand, too, that some persons are carrying out liver biopsy as an ambulatory procedure. I think that this is most unfortunate and will undoubtedly lead to trouble. We have not been willing to accept the occasional mortality which, so far as we can determine, is likely to occur with the posterior aspiration method as commonly used, and we believe the lateral intercostal method is also relatively dangerous because of the difficulty of getting at the area in case of a hemorrhage. For direct biopsy we have used the Silverman needle and insisted on there being a large and easily palpable liver, which, we were sure, was immediately beneath the abdominal wall. The prothrombin time should be normal or nearly so. In cases in which the liver is less evident, the biopsy has been done under peritoneoscopic control, a long Silverman needle being inserted into the liver through a subcostal approach, under direct visualization.

[16] György, P.: Personal communication to the author.

[17] Bloomfield, A. L.: Natural History of Chronic Hepatitis (Cirrhosis of Liver), Am. J. M. Sc. **195**: 429, 1938.

Dr. Theodore Gillman, Johannesburg, South Africa: I wish to thank you for the opportunity of presenting some of the results of liver biopsy studies which my associates and I have conducted in South Africa. The technic which we now use is a modification of that introduced by Iversen and Roholm. Preliminary experimental work in our usual laboratory animal, the baboon, revealed that the type of instrument as well as the approach used by the Danish workers was fraught with a number of difficulties and certainly with dangers. Careful examination of the anatomy of the circulation in the liver, particularly of the venous sinuses which drain into the large hepatic veins, was such as to make the lateral approach less desirable than the anterior approach. We modified the needle considerably, bearing in mind the warning which Professor McMichael had given about carrying out the biopsy with great speed. The main object of our modification in approach and in the construction of the instrument was to speed up the procedure in such a way that it was all over in a few seconds. We have now carried out about a thousand liver biopsies and thus far have contributed to the death of 1 patient, who had a huge tuberculotic liver, over the surface of which ran an extremely large vein. Even in this case the death could have been avoided if adequate surgical facilities had been available at the time. This method in the first place has provided us with a tremendous weapon in understanding pathologic changes in the liver in patients with known hepatic disease; perhaps equally important, it has permitted us to study the reactions of the liver in diseases in which pathologic changes of the liver are not initially expected. It is to this second type of problem that our studies have been mainly directed. We found a high incidence of hepatic disease, something like 97 per cent, in pellagra and allied forms of chronic malnutrition. We found that many substances, acclaimed as useful in the treatment and prevention of disease of the liver experimentally, were unsatisfactory in treating human hepatic disease. It soon became clear that once the liver had become damaged, other organs were also affected, including the nervous system, the endocrines and the alimentary canal, and that these other organs could contribute to the progress of the disease no less than did the hepatic disease. At that stage, it did not seem entirely satisfactory to direct attention solely to the existing hepatic disease. This led us to seek for therapeutic methods not aimed directly at the liver.

Dr. David Adlersberg, New York: Among other metabolic changes encountered in disease of the liver, one finds severe alterations of the metabolism of water. Parenchymal hepatic damage, especially in severe disease, is associated with retention in the tissues of orally ingested water ("hepatic oliguria"), while the stage of improvement and repair is often characterized by polyuria and removal of excessive water from the tissues. These changes of water metabolism may be used for diagnostic purposes. For those interested in a simple and practical hepatic function test which requires no laboratory and can be easily performed in the patient's home, the water tolerance test is recommended. Fasting patients are given 1,500 cc. of tap water within twenty to thirty minutes. Specimens of urine are then obtained every thirty minutes for five hours; the volume and specific gravity of each specimen are measured. In the absence of other factors influencing water metabolism —cardiac or renal disease, fever, ascites or visible edema— pronounced retention of water in the water tolerance test indicates hepatic damage (details may be found in: Adlersberg, D., and Fox, C. L., Jr.: *Ann. Int. Med.* 19:642 [Oct.] 1943). These observations have been recently confirmed and amplified by Dr. Hoagland and his group at the Hospital of the Rockefeller Institute in New York. The classification of hepatitis according to the severity of the disease, as used by Professor McMichael (grades A, B, C and D) will be of great help in future studies. My associates and I tried to employ a simpler subdivision of hepatitis in the daily clinical routine in "mild, moderately severe, severe and very severe." I was interested in Professor McMichael's remarks regarding the hippuric acid test. I agree with him that it is too sensitive for clinical purposes. I stressed this fact in my studies of hepatic function about ten years ago.

Dr. John McMichael, London, England: I have listened with great interest. The work that is going on is bound, sooner or later, to take us a great deal further than we stand today. The work which Dr. Gillman is doing in South Africa I think yields an enormous and unique field for studies on the nutritional type of hepatic disorder. I wish he had been able to tell more than he did in the time at his disposal. His experience has been astonishing in the nutritional field of disease of the liver. I am glad to hear him sound a warning about the tendency to use some of the amino acid and liver-trophic substances rather loosely, as though these were panaceas for disease of the liver. My experience in using these substances has been limited, but certainly we have had enough in the way of negative answers to make us extremely cautious; however, it is important that we should all continue to produce as much evidence as we can, and sooner or later we will get these problems sifted out.

Council on Pharmacy and Chemistry

NEW AND NONOFFICIAL REMEDIES

The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies. A copy of the rules on which the Council bases its action will be sent on application.

Austin Smith, M.D., *Secretary.*

PENICILLIN (See New and Nonofficial Remedies, 1947, p. 144).

The following additional dosage form has been accepted:

Abbott Laboratories, North Chicago, Ill.

Penicillin Sodium: 1,000,000 unit vials.

Premo Pharmaceutical Co., Inc., New York

Crystalline Penicillin G Sodium in Oil and Wax: 300,000 units per cubic centimeter, 10 cc. vials. Penicillin G sodium suspended in sesame oil containing 4.8 per cent (W/V) white wax, U. S. P.

METHIODAL SODIUM (See New and Nonofficial Remedies, 1947, p. 290).

The following dosage form has been accepted:

Winthrop-Stearns, Inc., New York

Solution Skiodan 40 per Cent: 100 cc. bottles.

Solution Skiodan 20 per Cent: 50 cc. bottles.

NITROFURAZONE (See New and Nonofficial Remedies, 1947, p. 81).

The following additional dosage form has been accepted:

Eaton Laboratories, Inc., Norwich, N. Y.

Solution Furacin 1: 500: 480 cc. bottles. Each 100 cc. contains nitrofurazone 0.2 Gm. and polyethylene glycol of mono-iso-octyl phenyl ether 0.3 Gm. in a mixture of polyethylene glycol 300, 32.5 Gm.; "carbowax 1540," 32.5 Gm., and water.

DIGITOXIN (See New and Nonofficial Remedies, 1947, p. 250).

The following additional dosage form has been accepted:

Wyeth Incorporated, Philadelphia

Solution Purodigin: 1 cc. Tubex (U. S. Trademark 406632. Each cubic centimeter contains 0.2 mg. of digitoxin in 40 per cent alcohol solution.

U. S. trademark 411,271.

CORRECTION

The monograph on Isobornyl Thiocyanoacetate-Technical which appeared under New and Nonofficial Remedies in THE JOURNAL, April 24, page 1099, should be corrected to read as follows:

Tests and Standards.—

Paragraph 1, sentence 3, "The refractive index... is 1.512."

Paragraphs 2 and 4, sentence 1, "Add...2*N* alcoholic potassium hydroxide."

Paragraph 2, sentence 3, "Acidify...with diluted sulfuric acid...."

Paragraph 5, sentence 1, "Dissolve 10 Gm...in 25 cc. of saturated methanolic potassium hydroxide.."

EDITORIAL ANNOUNCEMENT

The absence of the compositors from their work continues. This issue of THE JOURNAL has been prepared in part by the use of Vari-Typer machines.

STREAMLINING HEALTH EXAMINATIONS

Physicians and patients have been aware for many years of the importance of periodic examinations. Early diagnosis and the application of the " stitch in time" work wonders in tuberculosis, cancer, diabetes, heart disease, hypertension and most other chronic diseases. In most physicians' offices health examinations take time, frequently one or two hours. Few patients could bear the financial burden of the time taken. If the physician habitually contributed the extra time this eventually would become a burden.

Now the Joint Committee on Health Problems in Education of the National Education Association and the American Medical Association[1] suggest (*a*) that health examinations of school children be done routinely at this healthiest period of their lives only every three years; (*b*) that the parent accept the responsibility for furnishing the health history; (*c*) that the teacher take the responsibility for such tests as height, weight, vision and hearing; (*d*) that the parent or nurse be present at the examination in order to take prompt steps to follow up the discovery of defects with remedial action, and (*e*) that the physician devote only fifteen minutes of his time to making those tests and observations which obviously demand medical experience and judgment.

Suggestions for streamlining the more complex adult examination have also been made. White and Geschickter[2] have analyzed the approximately two thousand currently recognized disease entities and find that two hundred diseases are responsible for 98 per cent of the illness in the United States. They also find that sixteen common symptoms, twenty-three leading physical abnormalities and six essential laboratory observations will serve as keys for the differential diagnosis of these two hundred diseases. With the history and certain routine parts of the examination carefully completed by a well trained technical assistant and with the laboratory tests performed by the technician, the actual time demanded from the physician to determine the presence or absence of the twenty-three leading physical abnormalities and to summarize the result is estimated to average not more than ten to thirty minutes.

These efforts to " streamline" health examinations must not be confused with the recent recommendations of the Subcommittee on Physical Fitness of the Baruch Committee on Physical Medicine,[3] which call for an examination not only establishing the presence or absence of abnormalities but also the patient's fitness for work and play activities as well as his " will to do." Nor should these efforts be confused with the " Physical Profile Serial"[4] used by the British and Canadian armed services and suggested to leaders of our armed services for functionally classifying our manpower so that recruits could be called up hurriedly in classes.

Since 1923 the American Medical Association has sponsored the movement to popularize *periodic health examinations.*[5] These new reports merit careful study for their contribution to this important movement.

EVOLUTION OF MOLD ARTHROPLASTY OF THE HIP JOINT

Three main reasons, according to Smith-Petersen,[1] have been responsible for limited success in arthroplasty of the hip joint: surgical approaches were traumatic and inadequate; the joint created was defective because of lack of proper instruments, and the underlying principle of interposing a perishable barrier between imperfectly shaped joint surfaces was not sound. The supra-articular, subperiosteal approach to the hip developed by Smith-Petersen improved the exposure of the head and neck of the femur, and the excision of the anterior superior wall of the acetabulum permitted access to the other side of the joint. A fortuitous circumstance suggested to the author the idea of the mold. In 1923 a piece of glass which had been embedded for a year was removed from a patient's back. The glass was surrounded by a minimal amount of fibrous tissue, lined by a glistening synovial sac that contained a few drops of clear yellow fluid. This benign reaction to an inert foreign body suggested that here was a process of repair which might be applied to arthroplasty.

[5] Periodic Health Examination: A Manual for Physicians, Chicago, American Medical Association, 1940.

[1] Smith-Petersen, M. N.: Evolution of Mould Arthroplasty of the Hip Joint, J. Bone & Joint Surg. *30 B:*59 (Feb.) *1948.*

The idea gradually developed that a mold of some inert material interposed between newly shaped surfaces of the head of the femur and the acetabulum would guide nature's repair so that defects would be eliminated. The first material used was glass. Some of the glass molds broke after having been in place for a short time. When the pieces were removed the acetabulum and head of the femur were found to be covered by a firm, glistening lining, thus furnishing evidence that the principle of guiding nature's repair by means of a mold was sound. Smith-Petersen next resorted to "pyrex" molds with much the same results. In 1938 he began to use "vitallium" in his hip arthroplasties. Since then over five hundred hips have been operated on by this method at Massachusetts General Hospital; eighty of these operations were bilateral.

Law[2] has now reported that 80 per cent of late results were satisfactory to both patient and surgeon in 150 cases. Striking features were the relative painlessness, smooth movement of the hip joint, progressive improvement in function and reformation of the joint lines as seen roentgenographically. Function after arthroplasty for traumatic and degenerative arthritis approaches that of the normal hip joint much more closely than in cases of infected and rheumatoid arthritis. There is a complete absence of low back symptoms or postural difficulties. The operative mortality rate in this series was nil. During the six year period only 1 patient died as the result of a complication of the arthroplasty. Secondary operative revisions are often necessary, particularly in defective and rheumatoid arthritis. According to Smith-Petersen, this is the first time that the principle of the mold, the principle of guiding the repair of nature for the purpose of recreating a destroyed or damaged structure, has been applied to surgery.

Current Comment

EARLIER DISCOVERY AND TREATMENT OF DIABETES MELLITUS

The number of latent and undiscovered cases of diabetes in the United States is much larger than formerly supposed. The United States Public Health Service about two years ago established a Diabetes Office in Boston; their survey of 3,500 citizens of Oxford, Mass., in 1946 disclosed that 40 cases of diabetes were known to the physicians in the town but that there were 30 more entirely unrecognized cases. In this country there are at least 1,000,000 undiscovered cases of diabetes and also a large number of others in persons whose diabetes is labeled mild and who therefore are under little careful treatment. The result of the lack of treatment during several years in this middle-aged group of persons with mild cases of the disease is that later they appear with gangrene and retinitis but too late for remedy. The American Diabetes Association, composed of about a thousand physicians interested in diabetes, has appointed a committee to consider means of discovering these latent cases.

They have established a journal for the public called *A.D.A. Forecast*. This committee is also considering a "Diabetic Week" for some time in November or December. The suggestion has been made that centers be established, to be manned by physicians, in which tests of blood and urine could be performed on any person but especially on the relatives of diabetic patients. If diabetes was discovered the patient would be sent to his own physician for further treatment. Discovery of these patients with untreated diabetes is definitely a medical responsibility.

ASCORBIC ACID CONTENT OF STRAWBERRIES

Strawberries are an important source of ascorbic acid, vitamin C, although the vitamin content varies widely between varieties and even within the varieties. Much of the variation is due to heredity and environment. Investigators[1] in the U. S. Department of Agriculture recently tested a sufficient number of samples to permit statistical analysis of the data as to the nutritional value of the berries, the effects of shading the plants and the stage of maturity. Prominent varieties grown in the South—Blakemore, Klondike, Klonmore, Massey and Missionary—averaged about 50 mg. of ascorbic acid per 100 Gm. of berries for about 50 per cent of the national crop. The ascorbic acid content of many varieties grown in the Northeast averaged 60 to 65 mg. for 30 per cent of the national crop. In the Pacific Northwest Corvallis, Marshall and Red Heart varieties are high in ascorbic acid, averaging between 75 and 80 mg. for about 12 per cent of the national crop. The average for the entire crop of the country is said to be about 60 mg. per 100 Gm. of berries. Among the commercial varieties, a high ascorbic acid content was found in Catskill, Corvallis, Gandy, Fairmore, Fairpeake, Marshall, Red Heart and Tennessee Beauty. The environment that produces the best flavor includes high light intensity, warm days, cool nights and long daily light periods. High ascorbic acid content also is favored by moderately warm days, cool nights and high light intensity. Strawberries grown in the shade contained much less ascorbic acid than those exposed to normal sunlight. Half-red berries held for one or two days until finally red increased in ascorbic acid content, but not as much as did those ripened on the plant. These investigators concluded that the ascorbic acid content of strawberries in the United States probably averages about 60 mg. per 100 Gm. They believe that by breeding the average vitamin content could be increased up to 80 mg. or more.

NOMENCLATURE OF THE ANTI-Rh TYPING SERUMS

Castle, Wintrobe and Snyder[1] have recently reported the conclusions of the Advisory Review Board which convened at the request of the Surgeon General, U.S. Public Health Service, to consider nomenclature for anti-Rh typing serums. Evidence was presented by eight outstanding producers and users of such serums in the United States. The several discoveries and other considerations leading to the two main systems of nomenclature, i.e., the Wiener system and Fisher-Race system, were thoroughly discussed. The evidence presented indicates that the Fisher-Race nomenclature is much simpler and more easily understandable than the Wiener system. However, final decision was reserved, thus continuing the confusion which surrounds Rh terminology. As there is still confusion in many parts of the world with regard to the differences in the Moss and Jansky classification of blood groups, it seems probable, because of the relatively much greater complexity of, and numbers of genes entering into, the Rh system, that the net result of the present lack of decision will be even more confusing.

The evidence for the decision of the advisory board is summarized as follows:

IN FAVOR OF WIENER'S NOMENCLATURE

1. It has priority, having been proposed by one of the discoverers.
2. It is in use by many clinicicians and research workers and is understood by them.
3. It is used by nearly all the writers on the subject in the Western Hemisphere.
4. No conclusive evidence has been presented against the theory on which it is based.

AGAINST WIENER'S NOMENCLATURE

1. It does not always specify the antigens present in the type name, and it almost never does so in the genotype name.
2. It has changed rapidly from year to year.
3. It is losing followers among the producers and users of serums.
4. It involves complications, both typographic and genetic, of subscripts, superscripts, numbers, primes and other symbols.
5. It involves the somewhat doubtful assumption of multiple antigens produced by single genes.

IN FAVOR OF THE FISHER-RACE NOMENCLATURE

1. It always specifies in both type name and genotype name the individual antigens present.
2. It is in wide usage in England, is gaining in usage in the Western Hemisphere, and hence may become the international standard.
3. It is simple and direct, both typographically and genetically.
4. It conforms to a one to one correspondence between gene and antigen.

AGAINST THE FISHER-RACE NOMENCLATURE

1. It lacks priority.
2. It is based on a genetic hypothesis which is purely theoretic and for which no clear proof exists—a hypothesis no more tenable on genetic grounds than Wiener's hypothesis.

The board reached the following conclusions:

The Board, having carefully considered the above historical development of the two systems of nomenclature and having weighed the arguments in favor of, and opposed to, each system, is forced to the conclusion that for the present a compromise must be made, and both systems must be used on the container labels and package labels. Because the Wiener system has priority and is understood by everyone in the United States concerned with the production and use of anti-Rh serums, the Board recommends that the Wiener terminology appear first on the label followed by the Fisher-Race terminology in parentheses. Typical labels would then appear somewhat as follows:

Anti-Rh Typing Serum (human)
Anti-Rho (Anti-D)
Slide test
Lot No.
Manufacturer
Anti-Rh Typing Serum (human)
Anti-Rho (Anti-C plus D)
——————tube test
Lot No.
Manufacturer
Anti-Hr Typing Serum (human)
Anti-hr′ (Anti-c)
Capillary test
Lot No.
Manufacturer
Anti-Rh Typing Serum (human)
Anti-rh′ (Anti-C)
Slide test
Lot No.
Manufacturer

The package label and literature might contain, in addition to the above, the description of the test by means of which the serum is to be used.

THE CHICAGO SESSION

AMERICAN MEDICAL ASSOCIATION, NINETY-SEVENTH ANNUAL SESSION
CHICAGO, JUNE 21-25, 1948

OFFICIAL CALL

TO THE OFFICERS, FELLOWS AND MEMBERS OF THE AMERICAN MEDICAL ASSOCIATION

The ninety-seventh annual session of the American Medical Association will be held in Chicago, June 21-25, 1948.

The House of Delegates will convene at 10 a. m. Monday, June 21. In the House the representation of the various constituent associations for 1947, 1948 and 1949 is as follows:

Alabama	2	Nevada	1
Arizona	1	New Hampshire	1
Arkansas	2	New Jersey	5
California	9	New Mexico	1
Colorado	2	New York	20
Connecticut	3	North Carolina	3
Delaware	1	North Dakota	1
District of Columbia	2	Ohio	7
Florida	2	Oklahoma	2
Georgia	3	Oregon	2
Idaho	1	Pennsylvania	10
Illinois	9	Rhode Island	1
Indiana	4	South Carolina	1
Iowa	3	South Dakota	1
Kansas	2	Tennessee	2
Kentucky	2	Texas	5
Louisiana	2	Utah	1
Maine	1	Vermont	1
Maryland	2	Virginia	2
Massachusetts	6	Washington	2
Michigan	5	West Virginia	2
Minnesota	4	Wisconsin	3
Mississippi	1	Wyoming	1
Missouri	4	Alaska	1
Montana	1	Hawaii	1
Nebraska	2	Isthmian Canal Zone	1
		Puerto Rico	1

The scientific sections of the American Medical Association, the Medical Corps of the Army, the Medical Corps of the Navy and the Public Health Service are entitled to one delegate each.

The Scientific Assembly of the Association will be open with the General Scientific Meetings to be held Monday, June 21, starting at 2 p. m. and continuing throughout the morning and afternoon of Tuesday, June 22. The Inauguration Meeting at which the President will be installed will be held on Tuesday, June 22, starting at 8 p. m. The sections will meet Wednesday, Thursday and Friday, June 23, 24 and 25, as follows:

CONVENING AT 9 A. M.
THE SECTIONS ON

Pediatrics.

Surgery, General and Abdominal.

Ophthalmology.

Experimental Medicine and Therapeutics.

Nervous and Mental Diseases.

Dermatology and Syphilology.

Gastro-Enterology and Proctology.

Radiology.

Miscellaneous Topics:
Session on Allergy;
Session on Diseases of the Chest; Session on Physical Medicine;
Session on History of Medicine.

CONVENING AT 2 P. M.
THE SECTIONS ON

Internal Medicine.

Obstetrics and Gynecology.

Laryngology, Otology and Rhinology.

Pathology and Physiology.

Orthopedic Surgery.

Urology.

Preventive and Industrial Medicine and Public Health.

Anesthesiology.

General Practice of Medicine.

The Registration Bureau, which will be located on the Navy Pier, will be open from 8:30 a.m. until 5:30 p.m. Monday, Tuesday, Wednesday and Thursday, June 21, 22, 23 and 24, and from 8:30 a.m. to 12 noon Friday, June 25.

EDWARD L. BORTZ, President.
ROY W. FOUTS, Speaker, House of Delegates.
GEORGE F. LULL, Secretary.

MEMBERS OF THE HOUSE OF DELEGATES

A Preliminary Roster of the Legislative Body of the American Medical Association

The list of members of the House of Delegates for the session is incomplete, as a number of the state associations are yet to hold their meetings at which delegates will be elected. The following is a list of the holdover members of the House of Delegates and of the newly elected members who have been reported to the Secretary in time to be included:

STATE DELEGATES

ALABAMA

A. A. Walker, Birmingham.
Lloyd Noland, Fairfield.

ARIZONA

Jesse D. Hamer, Phoenix.

ARKANSAS

Darmon A. Rhinehart, Little Rock.

CALIFORNIA

H. Gordon MacLean, Oakland.
E. Vincent Askey, Los Angeles.
John W. Cline, San Francisco.
Donald Cass, Los Angeles.
Ralph B. Eusden, Long Beach.
Robertson Ward, San Francisco.
Samuel J. McClendon, San Diego.
Lowell S. Goin, Los Angeles.
John Winston Green, Vallejo.

COLORADO

William H. Halley, Denver.
George A. Unfug, Pueblo.

CONNECTICUT

Joseph H. Howard, Bridgeport.
Creighton Barker, New Haven.
Thomas P. Murdock, Meriden.

DELAWARE

James Beebe, Lewes.

DISTRICT OF COLUMBIA

Herbert P. Ramsey, Washington.
Coursen B. Conklin, Washington.

FLORIDA

Homer L. Pearson Jr., Miami.
Louis M. Orr II, Orlando.

GEORGIA

Olin H. Weaver, Macon.
Allen H. Bunce, Atlanta.
Benjamin H. Minchew, Waycross.

IDAHO

Hoyt B. Woolley, Idaho Falls.

ILLINOIS

Robert H. Hayes, Chicago.
Fred H. Muller, Chicago.
Mather Pfeiffenberger, Alton.
Edward H. Weld, Rockford.

INDIANA

Homer G. Hamer, Indianapolis.
Alfred S. Giordano, South Bend.
William M. Cockrum, Evansville.
Franklin S. Crockett, LaFayette.

IOWA

Gerald V. Caughlan, Council Bluffs.

KANSAS

Philip W. Morgan, Emporia.

KENTUCKY

Joshua B. Lukins, Louisville.
W. Clark Bailey, Harlan.

LOUISIANA

Val H. Fuchs, New Orleans.
James Q. Graves, Monroe.

MAINE

Thomas A. Foster, Portland.

MARYLAND

Thomas S. Cullen, Baltimore.

MASSACHUSETTS

Charles J. Kickham, Brookline.
Leland S. McKittrick, Boston.

MICHIGAN

Wyman D. Barrett, Detroit.
Thomas K. Gruber, Eloise.
Claude R. Keyport, Grayling.
Leo G. Christian, Lansing.
William A. Hyland, Grand Rapids.

MINNESOTA

William A. Coventry, Duluth.
Alfred W. Adson, Rochester.
Erling W. Hansen, Minneapolis.
Frank J. Savage, St. Paul.

MISSISSIPPI

James P. Wall, Jackson.

MISSOURI

Robert E. Schlueter, St. Louis.
James R. McVay, Kansas City.
Howard B. Goodrich, Hannibal.
Warren L. Allee, Eldon.

MONTANA

Raymond F. Peterson, Butte.

NEBRASKA

Karl S. J. Hohlen, Lincoln.

NEVADA

Roland W. Stahr, Reno.

NEW HAMPSHIRE

Deering G. Smith, Nashua.

NEW JERSEY

J. Wallace Hurff, Newark.
Thomas K. Lewis, Camden.
Hilton S. Read, Ventnor.
Joseph F. Londrigan, Hoboken.
William F. Costello, Dover.

NEW YORK

Walter P. Anderton, New York.
Herbert H. Bauckus, Buffalo.
Albert E. R. Andresen, Brooklyn.
Thomas M. Brennan, Brooklyn.
James R. Reuling, Bayside.
Floyd S. Winslow, Rochester.
Ralph T. B. Todd, Tarrytown.
Oliver W. H. Mitchell, Syracuse.
Edward P. Flood, New York.
Albert A. Gartner, Buffalo
John J. Masterson, Brooklyn.
J. Stanley Kenney, New York.
Thomas A. McGoldrick, Brooklyn.
Andrew A. Eggston, Mount Vernon.
Harry Aranow, Bronx.
Peter J. DiNatale, Batavia.
George W. Kosmak, New York.
Stephen R. Monteith, Nyack.
Joseph P. Henry, Rochester.
Scott Lord Smith, Poughkeepsie.

OHIO

L. Howard Schriver, Cincinnati.
Clifford C. Sherburne, Columbus.

OKLAHOMA

Charles R. Rountree, Oklahoma City.

OREGON

Raymond M. McKeown, Coos Bay.
Edward H. McLean, Oregon City.

PENNSYLVANIA

William Bates, Philadelphia
Francis F. Borzell, Philadelphia.
Walter F. Donaldson, Pittsburgh.
Charles L. Shafer, Kingston.
William L. Estes Jr., Bethlehem.
Elmer Hess, Erie.
James Z. Appel, Lancaster.
E. Roger Samuel, Mount Carmel.
James L. Whitehill, Rochester
George S. Klump, Williamsport.

RHODE ISLAND

Herman A. Lawson, Providence.

SOUTH CAROLINA

Hugh P. Smith, Greenville.

TENNESSEE

Hiram B. Everett, Memphis.

TEXAS

Howard R. Dudgeon, Waco.
Britton E. Pickett Sr., Carrizo Springs.
Edward H. Cary, Dallas.

UTAH

James P. Kerby, Salt Lake City.

VERMONT

Theodore H. Harwood, Burlington.

VIRGINIA

J. Morrison Hutcheson, Richmond.
Henry B. Mulholland, Charlottesville.

WASHINGTON

Raymond L. Zech, Seattle.
Donald G. Corbett, Spokane

WEST VIRGINIA

Walter E. Vest, Huntington.
Ivan Fawcett, Wheeling.

WISCONSIN

Stephen E. Gavin, Fond du Lac.
James C. Sargent, Milwaukee.
William D. Stovall, Madison.

WYOMING

George P. Johnson, Cheyenne.

PUERTO RICO

Carlos E. Munoz-MacCormick, Santurce.

DELEGATES FROM THE SECTIONS AND GOVERNMENT SERVICES

INTERNAL MEDICINE

Charles T. Stone, Galveston, Texas.

SURGERY, GENERAL AND ABDOMINAL

Grover C. Penberthy, Detroit.

OBSTETRICS AND GYNECOLOGY

Jean Paul Pratt, Detroit.

OPHTHALMOLOGY

Arthur J. Bedell, Albany, N. Y.

LARYNGOLOGY, OTOLOGY AND RHINOLOGY

Hull, Director, Chicago; Advisory Committee—Howard F. Root, Boston; Paul J. Hanzlik, San Francisco; Ludvig Hektoen, Chicago; Urban Maes, New Orleans; Max M. Peet, Ann Arbor, Mich.; James P. Leake, Washington, D.C.

CHICAGO—1948

The center of activities of the 1948 Annual Session will be the great Navy Pier, which extends nearly a mile into Lake Michigan from the foot of Grand Avenue and is less than a mile from the headquarters office of the Association. The entire pier is being developed into halls and exhibit rooms so that a considerable number of the scientific sessions, the registration bureau and the complete scientific and technical exhibits will be housed on the pier. The pier is 292 feet wide and is capable of accommodating thousands of persons comfortably for convention purposes.

The visitor to the Annual Session will enter the pier, which is easily accessible by the streetcar, motorbus or taxi, and will register in the usual manner at a special registration desk. He will then pass through the technical exhibits, which will represent more than three hundred exhibitors, and then through the scientific exhibits, more numerous and occupying a larger space than ever before except at the Centennial Session in Atlantic City, N. J., last year. A complete description of these exhibits appears elsewhere in this issue. After passing through the scientific exhibits the visitor will reach some of the large halls which have been designed for lectures and motion pictures and for the section meetings.

During its history of more than a hundred years the American Medical Association has met frequently in Chicago. More recent previous sessions have been 1918, 1924 and 1944. For most American physicians any detailed discussion of Chicago and its facilities is hardly necessary. The development of Chicago in art, finance, science, manufacturing and as a medical center is phenomenal. Its access to railroad, air and other transportation is more direct than that of any other city in the country.

Chicago Hotels

The visitor to this session need have no fear as to proper hotel accommodations. Although the large centrally located hotels can accommodate many thousands, they are already being taxed to their capacity by reservations of prospective visitors. The city extends, however, many miles to the north, south and west, and there are great numbers of hotels fronting on Lincoln Park and the lake toward the south which are just a few minutes by good transportation to the Loop. As will be noted elsewhere in this issue, the House of Delegates will hold its meetings at the Palmer House. The Inauguration Meeting is scheduled for the Hotel Stevens. The Woman's Auxiliary will meet at the La Salle Hotel. Many of the special societies which will be meeting in Chicago either before or after the Annual Session are scheduled for other hotels. North of the Chicago River, the Sheraton Hotel is accommodating some of the section meetings.

It is suggested that if hotel reservations have not yet been secured by Fellows who expect to attend the Chicago session, such Fellows write directly to Dr. Fred H. Muller, 105 West Madison Street, Room 1707, Chicago 2.

Features of Medical Interest

Chicago provides numerous features of special medical interest. The medical schools are known throughout the world. The University of Chicago, University of Illinois (which includes Rush Medical College), Northwestern University and Loyola University medical schools have many thousands of alumni who will be renewing acquaintanceship with their alma maters. The facilities of Cook County Hospital and many other great hospitals in the Chicago area will be of interest to the physicians from all over the world who are planning to attend this session. Research institutions include those at the University of Chicago, Michael Reese Hospital, the Hektoen Institute of the Cook County Hospital and Children's Memorial Hospital. The Health Department of Chicago will offer opportunity to study its methods and will make available visits to institutions under municipal control, including the contagious hospitals and the Municipal Tuberculosis Sanitarium.

HEADQUARTERS OF THE AMERICAN MEDICAL ASSOCIATION

Fellows are cordially invited to visit the headquarters of the American Medical Association, 535 North Dearborn Street, corner of Dearborn Street and Grand Avenue, at any time during the Annual Session, June 21 to 25, from 8:30 a.m. to 4:30 p.m.

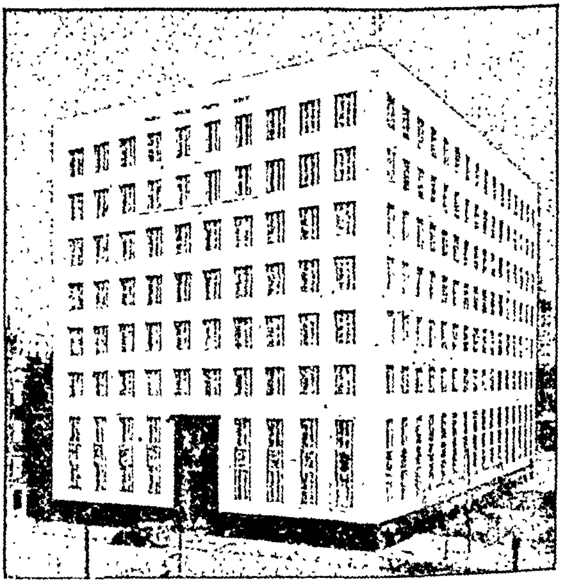
How to Reach the Headquarters of the American Medical Association

For physicians staying at hotels in the Loop, access to the headquarters of the Association is easy by bus, subway or streetcar. Via bus, board a north bound bus on Michigan Boulevard, ride to Grand Avenue and walk four blocks west. Via subway, enter any subway station on State Street, ride north to Grand Avenue and on leaving the subway walk one block west. Via streetcar, board any streetcar on State Street north bound numbered " 6 " or " 36 ", ride to Grand Avenue and walk one block west, or board any streetcar on Clark Street north bound to Grand Avenue and walk one block east.

For physicians stopping at hotels on the north side of the city, the headquarters may be reached as follows: Via bus, take a south bound bus to Grand Avenue and walk four blocks west; via subway, ride south to Grand Avenue and on leaving the subway walk one block west; via streetcar, board a State Street car south bound to Grand Avenue and then walk one block west, or board Clark Street car south bound to Grand Avenue and walk one block east.

Activities of Association

The American Medical Association Building is a nine story stone structure housing all activities of the Association, including its printing plant. For the benefit of visiting Fellows, there is available a staff of guides familiar with the functions of the Association. In addition to the printing plant, including a press room, composing room, mailing room and bindery, which occupy the first three floors and basement, the departments include the Bureau of Medical Economic Research; Bureau of Legal Medicine and Legislation; Bureau of Exhibits; Council on Medical Service; Council on Industrial Health; Council on Pharmacy and Chemistry; Council on Physical Medicine; Council on Foods and Nutrition; Chemical Laboratory; Bureau of Health Education; Bureau of Investigation; Council on Medical Education and Hospitals; Directory Department, including a biographic index of physicians; Hygeia Circulation Department; Office of the Secretary and General Manager; Office of the Business Manager; Advertising Department; Accounting Department; Fellowship, Membership and Subscription Department; Cooperative Medical Advertising Bureau; Office of the Editor; Editorial Department, including News Department, Foreign Abstracting Department, Manuscript Editing Department, Hygeia Editorial Office and Library; Assembly Room, and Board of Trustees Room.



A.M.A. HEADQUARTERS
535 NORTH DEARBORN STREET

Too limited a number of Fellows of the American Medical Association are aware of the facilities available at the headquarters of the Association for carrying on its work, including the physical equipment for the printing of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION; the special journals, namely, *American Journal of Diseases of Children, Archives of Dermatology and Syphilology, Archives of Internal Medicine, Archives of Neurology and Psychiatry, Archives of Ophthalmology, Archives of Otolaryngology, Archives of Pathology, Archives of Surgery* and *Occupational Medicine; Hygeia;* American Medical Directory; *Quarterly Cumulative Index Medicus,* and by-products of THE JOURNAL and of the Press of the American Medical Association.

While it is realized that those who attend the Annual Session of the American Medical Association will be pretty well occupied, it is hoped that each of them will find at least one hour during the week for visiting the Headquarters of the Association to see for himself something of the work that is being done

REGISTRATION

The Bureau of Registration will be located on the Navy Pier. An information bureau will be operated in connection with the Bureau of Registration.

Who May Register

Only Fellows, Affiliate, Associate and Honorary Fellows and Invited Guests, may register and take part in the work of the sections. Fellows of the Scientific Assembly are those who have, on the prescribed form, applied for Fellowship, subscribed to THE JOURNAL and paid their Fellowship dues for the current year. Fellowship dues and subscription to THE JOURNAL are included in the one annual payment of $12, which is the regular subscriptionprice of THE JOURNAL. Fellowship cards are sent to all Fellows after payment of annual dues, and these cards should be presented at the registration window. Any who have not received cards for 1948 should secure them at once by writing to the American Medical Association, 535 North Dearborn Street Chicago 10.

Members in Good Standing Eligible to Apply for Fellowship in the Association

Members in good standing in the American Medical Association are those members of component county medical societies and of constituent state and territorial medical associations whose names are officially reported for enrolment to the Secretary of the American Medical Association by the secretaries of the constituent medical associations. All members in good standing may apply for Fellowship in the Scientific Assembly and are urged to qualify as Fellows before leaving home in order that pocket cards may be secured and brought to Chicago so that registration can be more easily and more promptly effected.

Application forms may be had on request.

Those subscribers to THE JOURNAL who have not received pocket cards for 1948 should write to the American Medical Association in order to obtain application blanks and information as to further requirements..

Register Early

Fellows living in Chicago as well as all other Fellows who are in Chicago on Monday and Tuesday, should register as early as possible.

The names and local addresses of those who register will be included in the issue of the *Daily Bulletin* appearing the next day, and this will enable visiting physicians to find friends who have registered.

Suggestions That Will Facilitate Registration

Fellows should fill out completely the spaces on both sections of the front of the registration card. Physicians who desire to qualify as Fellows should fill out completely the spaces on both sections of the front of the registration card and sign the application on the back. These cards will be found on the tables.

Entries on the registration card should be written plainly, or printed, as the cards are given to the printer to use as "copy" for the *Daily Bulletin*, which appears on Tuesday, Wednesday, Thursday and Friday mornings during the week of the session.

Fellows who have their pocket cards with them can be registered with little or no delay. They should present the filled out registration card, together with the pocket card, at one of the windows marked "Registration by Pocket Card." There the clerk will compare the two cards, stamp the pocket card and return it and supply the Fellow with a badge and a copy of the official program

As previously stated, it will assist in the registration if those who desire to qualify as Fellows will file their applications and qualify as Fellows by writing directly to the American Medical Association, 535 North Dearborn Street, Chicago 10, so that their Fellowship may be entered not later than May 22. Any applications that are received later than May 22 will be given prompt attention, but the Fellowship pocket card may not reach the applicant in time for him to register at the Chicago session.

It will be possible for members of the organization to qualify as Fellows at Chicago. In order to do this, applicants for Fellowship will be required to fill out both sections of the front of the registration card and to sign the formal application that is printed on the reverse side of the card. It is suggested that those members who apply for Fellowship at Chicago bring with them their state membership cards for the year 1948. The state membership card should be presented along with the filled in registration card at the window in the booth marked "Applicants for Fellowship and Invited Guests."

As already stated, registration can be effected more easily and promptly if members will qualify as Fellows before leaving home.

Registration for General Officers and Delegates at the Palmer House

General Officers of the American Medical Association and members of the House of Delegates may register for the Scientific Assembly outside the Red Lacquer Room of the Palmer House. This arrangement is made for the convenience of members of the House of Delegates, which will convene on Monday morning at 10 o'clock in the Red Lacquer Room of the Palmer House. Delegates are requested to register for the Scientific Assembly before presenting credentials to the Reference Committee on Credentials of the House of Delegates. Registration of delegates for the Scientific Assembly will begin at 8 o'clock Monday morning, June 21, and delegates are urged to register early so that all members of the House of Delegates may be seated in in time for the opening session of the House.

TRANSPORTATION

It is suggested that those Fellows who contemplate traveling to Chicago to attend the annual session of the Association secure information concerning railroad and airplane travel directly from their local ticket agents, who are in a position to give them information regarding train or plane schedules and fares.

MEETING PLACES

HOUSE OF DELEGATES: Red Lacquer Room, Palmer House, 15 East Monroe Street.

GENERAL SCIENTIFIC MEETINGS: Auditorium, Navy Pier.

INAUGURATION MEETING: Ballroom, Stevens Hotel, 720 South Michigan Avenue.

GENERAL HEADQUARTERS, REGISTRATION BUREAU, SCIENTIFIC EXHIBIT, TECHNICAL EXHIBITS AND INFORMATION BUREAU: Navy Pier.

EXPERIMENTAL MEDICINE AND THERAPEUTICS: Room 4, Navy Pier.

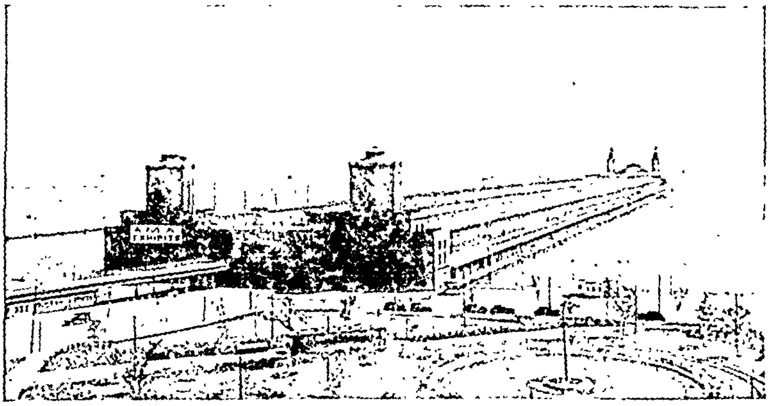
PATHOLOGY AND PHYSIOLOGY: Room 4, Navy Pier.

NERVOUS AND MENTAL DISEASES: Room 3, Navy Pier.

DERMATOLOGY AND SYPHILOLOGY: Room 1, Navy Pier.

PREVENTIVE AND INDUSTRIAL MEDICINE AND PUBLIC HEALTH: Room 5, Navy Pier.

UROLOGY: Room 1, Navy Pier.



NAVY PIER WHERE MANY SECTION MEETINGS WILL BE HELD. ALSO REGISTRATION AND THE EXHIBITS.

SECTIONS OF SCIENTIFIC ASSEMBLY

INTERNAL MEDICINE: Auditorium, Navy Pier.

SURGERY, GENERAL AND ABDOMINAL: Ballroom, Sheraton Hotel, 505 North Michigan Avenue.

OBSTETRICS AND GYNECOLOGY: Ballroom, Sheraton Hotel, 505 North Michigan Avenue.

OPHTHALMOLOGY: Thorne Hall, Northwestern University, 710 Lake Shore Drive.

LARYNGOLOGY, OTOLOGY AND RHINOLOGY: Thorne Hall, Northwestern University, 710 Lake Shore Drive.

PEDIATRICS: Auditorium, Navy Pier.

ORTHOPEDIC SURGERY: Room 3, Navy Pier.

GASTRO-ENTEROLOGY AND PROCTOLOGY: Room 5, Navy Pier.

RADIOLOGY: Boulevard Room, Sheraton Hotel.

ANESTHESIOLOGY: Boulevard Room, Sheraton Hotel.

GENERAL PRACTICE OF MEDICINE: Room 2, Navy Pier.

MISCELLANEOUS TOPICS: Session on Allergy, Session on Diseases of the Chest and Session on History of Medicine: Room 2, Navy Pier. Session on Physical Medicine: Assembly Room, Building of the American Medical Association, 535 North Dearborn Street.

ENTERTAINMENT

Conference of County Society Officers

There will be a conference of county medical society officers on Sunday, June 20, at 2:30, in the Red Lacquer Room of the Palmer House. It will be conducted in round table fashion with Dr. A. M. Mitchell of Terre Haute, Ind., as moderator. Fellows are invited to attend this conference.

Dinner for Delegates

A dinner is being arranged for Monday, June 21, for members of the House of Delegates and officers of the Association. Complete information concerning the dinner will be available at the first meeting of the House of Delegates on Monday morning, June 21.

Luncheon for Delegates

A luncheon for the members of the House of Delegates and the officers of the American Medical Association is being planned for Tuesday noon, June 22, between the morning and afternoon meetings of the House of Delegates at the Palmer House.

Installation of President

The Inauguration Meeting at which the President will be installed will be held on Tuesday evening, June 22, in the Ballroom of the Hotel Stevens.

Breakfast for Vice Presidents

VICE PRESIDENTS' Breakfast, given by Dr. L. H. South, Tuesday, June 22, 8 a.m., Palmer House.

President's Reception and Ball

The President of the Association will be honored with a reception and ball to be held Thursday evening, June 24, at 9 o'clock in the Ballroom of the Palmer House.

Luncheons, Dinners and Meetings of other Organizations

ALPHA KAPPA KAPPA, Luncheon, Wednesday, June 23 in the Gothic Room of the Sheraton Hotel, 12:30 p.m.

ALPHA OMEGA ALPHA, Dinner, Thursday, June 24 in the Palmer House, 6:30 p. m.

ALUMNAE ASSOCIATION OF WOMAN'S MEDICAL COLLEGE OF PENNSYLVANIA, Dinner, Wednesday, June 23, at 7 o'clock in Windemere East Hotel, Regency Room, $4 a person. Reservations may be made through Dr. Doris Phillips, Michael Reese Hospital, Chicago.

ALUMNI ASSOCIATION OF LONG ISLAND COLLEGE OF MEDICINE, Cocktail Party, Wednesday, June 23, 5 to 7 p.m., Stevens Hotel, Chicago.

ALUMNI OF NORTHWESTERN UNIVERSITY MEDICAL SCHOOL, Luncheon, Thursday, June 24 at Thorne Hall, Northwestern University, 12 noon, $1.50 a person. Reservations may be made through the Medical Alumni Office, 303 East Chicago Avenue, Chicago 11.

ALUMNI ASSOCIATION OF UNIVERSITY OF LOUISVILLE, Wednesday, June 23.

AUGUSTANA HOSPITAL INTERNS ALUMNI REUNION, Banquet, La Salle Hotel, Wednesday, June 23, 6:30 p. m. $6 a plate.

CHRISTIAN MEDICAL SOCIETY, Convention Dinner, 6:00 p.m., Wednesday, June 23, Eitel Restaurant, Field Building, 135 South LaSalle Street. $3.50 a plate. Speaker, Dr. L. Nelson Bell.

CORNELL UNIVERSITY MEDICAL COLLEGE Alumni, Dinner, 7:00 p.m., Thursday, June 24, Palmer House. $6.00 a ticket.

FEDERATION OF CATHOLIC PHYSICIANS' GUILDS, Wednesday, June 23, Luncheon.

HARVARD MEDICAL SCHOOL ALUMNI ASSOCIATION, Dinner, Wednesday, June 23, 6:30 p.m., University Club, 76 East Monroe Street. Speakers will be Dean Burwell and Drs. Walter Bauer and Francis D. Moore.

IOTA CHAPTER OF PHI BETA PI, UNIVERSITY OF ILLINOIS CHAPTER, Stag Dinner, 7:30 p.m. Monday, June 21, Hotel La Salle, $6.00 a ticket.

LOYOLA UNIVERSITY ALUMNI ASSOCIATION, Dinner 6 p.m. Wednesday, June 23, Sheraton Hotel, $ 4.50 a plate.

PHI BETA PI FRATERNITY, Luncheon, La Salle Hotel, Wednesday, June 23, $4 a plate.

PHI DELTA EPSILON MEDICAL FRATERNITY, Luncheon, the Standard Club, 12:30 p. m. Wednesday, June 23, $2.25 a ticket.

PHI LAMBDA KAPPA MEDICAL FRATERNITY, Luncheon Reunion Meeting, Congress Hotel, Wednesday, June 23, 12:15 p. m.

PHI RHO SIGMA ALUMNI, Luncheon, Wednesday, June 23, 12:30 p. m., Chicago Yacht Club.

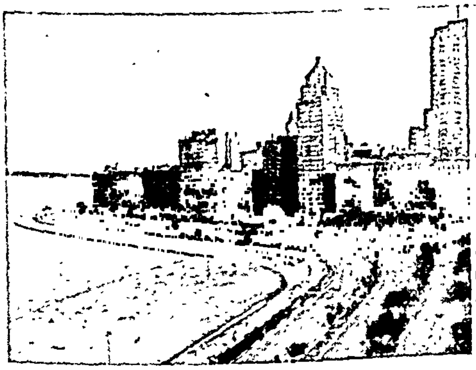
PRESBYTERIAN HOSPITAL, Intern-Resident Reunion, Dinner, Tuesday, June 22, 6:30 p. m., Congress Hotel, Casino Room. Reservations may be made through the Medical Director's Office of the Hospital.

RUSH MEDICAL ALUMNI ASSOCIATION, Luncheon, Wednesday, June 23, 12 noon, Palmer House. For advance reservation write Dr. Grant H. Laing, Secretary, 104 South Michigan, Chicago.

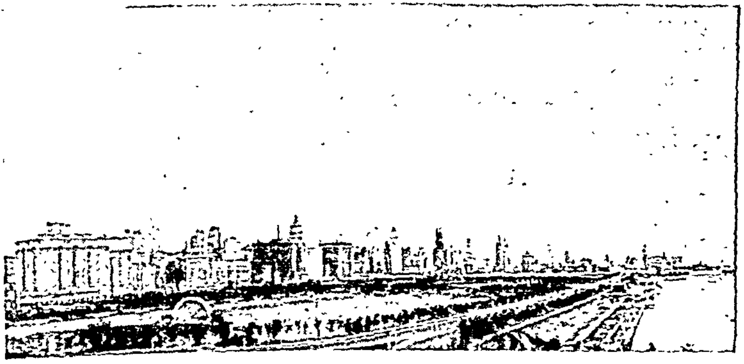
WOMAN'S AUXILIARY

A most cordial invitation is extended to all women who are Auxiliary members or guests of physicians attending the session of the American Medical Association to participate in all social functions and attend the general sessions. Whether Auxiliary members or not, the wives of physicians will be most welcome.

Auxiliary headquarters will be on the mezzanine floor of the Hotel LaSalle. All meetings and functions will be held at the Hotel LaSalle unless otherwise stated in the program or announced during the meeting. Please register early and obtain your badge and program of the social functions.



THE NEAR NORTHSIDE AT OAK STREET AND THE OUTER DRIVE.



THE CHICAGO SKYLINE ALONG MICHIGAN AVENUE LOOKING NORTH. THE HOTEL STEVENS IS THE FIRST BUILDING ON THE LEFT.

All tickets should be purchased soon after arrival. These will be sold only at the Auxiliary headquarters. All meetings and social affairs will begin at the time scheduled. Please be prompt.

REGISTRATION HOURS

Sunday	2 p.m. to 4 p.m.
Monday	9 a.m. to 4 p.m.
Tuesday	9 a.m. to 4 p.m.
Wednesday	9 a.m. to 4 p.m.

Preconvention Meetings

PROGRAM

SUNDAY, JUNE 20, 1948

COMMITTEE MEETINGS

2 to 4 p.m. Registration (mezzanine floor).

8 p.m. Finance Committee, Room B (mezzanine floor). Mrs. Scott C. Applewhite, chairman.

MONDAY, JUNE 21

9:30 a.m. Board of Directors, Room B (mezzanine floor). Presiding.....Mrs. Eustace A. Allen, President.

10 a.m. Nominating Committee, Room A (mezzanine floor). Mrs. David W. Thomas, chairman.

12:30 p.m. Luncheon of Board of Directors, Room C (mezzanine floor).

4 p.m. Tea in honor of Mrs. Eustace A. Allen, President. and Mrs. Luther H. Kice, President-Elect, Woman's Auxiliary to the American Medical Association, Century Room.

Tickets $1.25. All doctors' wives cordially invited.

Hostesses: Auxiliaries to the Illinois State Medical Society and to the Chicago Medical Society.

8 p.m. Revisions Committee Meeting, Room B (mezzanine floor). Mrs. Roscoe E. Mosiman, chairman.

TUESDAY, JUNE 22

9 a.m

Formal opening of the twenty-fifth annual meeting of the Woman's Auxiliary to the American Medical Association.

Illinois Room (mezzanine floor)

Presiding.......Mrs. Eustace A. Allen, President

Invocation...........Rev. Charles Ray Goff, D.D.

Pastor, Chicago Temple, First Methodist Church

Pledge of Loyalty to the Woman's Auxiliary to the American Medical Association..Mrs. Jesse D. Hamer

Greetings................J. Roscoe Miller, M.D., President, Chicago Medical Society

Address of Welcome.............Mrs. John Soukup, Immediate Past President, Woman's Auxiliary to the Illinois State Medical Society

Response..................Mrs. Robert Flanders, President, Woman's Auxiliary to the New Hampshire Medical Society

Presentation of Convention Chairman, Mrs. Rollo K. Packard

Presentation of President-Elect, Mrs. Luther H. Kice

Introductions..............Mrs. Eustace A. Allen

PHYSICIANS' ART EXHIBIT

The American Physicians Art Association will have exhibitions during the American Medical Association session in Chicago June 21 to 25, on the Navy Pier. Over two hundred cups will be awarded winners in the various types of art. For detailed information write to F. H. Redewill, M.D., Executive Secretary, 526 Flood Building, San Francisco 2.

GOLF TOURNAMENT

The American Medical Golfing Association will hold its thirty-second tournament on Monday, June 21. The famous, beautiful and sporty Olympia Fields has been reserved for the medical golfers' tournament. Dinner will be held in Olympia Fields C.C. Clubhouse, after which prizes will be awarded.

Two Eighteen-Hole Courses

Olympia Fields Country Club has two eighteen-hole courses which are ideal for experts and a treat for players with higher handicaps. Fellows may tee off between 7:30 a.m. and 2 p.m. Luncheon will be served at the club. The golfers' banquet will be held at 7 p.m. Entertainment will follow the awarding of prizes.

Trophies and Prizes

Trophies will be awarded for the Association championship (thirty-six holes), the Will Walter Trophy; the runner-up champion, the Detroit Trophy; the eighteen hole championship, the Golden State Trophy; the runner-up eighteen hole champion, the Ben Thomas Trophy. The Section Event will include sterling silver pitchers for eight sections including internal medicine, surgery, gynecology and obstetrics, dermatology and syphilology, radiology, general practice, pediatrics, eye, ear, nose and throat, and urology. The first flight (0 to 13) will contain trophies and prizes for both gross and net in thirty-six and eighteen holes including the St. Louis Trophy, the President's Trophy, the Atlantic City Trophy and the Sperry Trophy. The second and third flights (14 to 18 and 19 to 30), will contain prizes for both thirty-six and eighteen holes; the maturity event (for Fellows 60 years and older), the Minneapolis Trophy; the Old Guard Championship, the Wendell Phillips Trophy. In addition to these, approximately seventy-five other prizes will be in competition.

Trophies Awarded at Recent Annual Tournaments of American Medical Golfing Association.

Ten trophies of the American Medical Golfing Association are on permanent display at the American Medical Association headquarters in Chicago.

in a case in the reception room to the right of the entrance.

In the back row in the picture are the Detroit Trophy for the runner-up champion thirty-six holes; the Golden State Trophy, which goes to the champion for the eighteen hole gross; the Minneapolis Trophy, top prize in the Maturity Event; the Will Walter Trophy for the Champion of the Field for the best thirty-six hole gross, and the Ben Thomas Trophy for the runner-up champion of the eighteen hole gross.

In the front row are the Wendell Phillips Trophy, emblematic of the "Old Guard Championship"; the Sperry Trophy, first flight, low net eighteen holes; the Atlantic City Trophy for the winner of the first flight low gross eighteen holes; the St. Louis Trophy, emblematic of first flight, low gross thirty-six holes, and the Wetherell Trophy, first flight, second low net, eighteen holes.

Chicago Committee on Arrangements

The Chicago Committee on Arrangements is under the chairmanship of Charles E. Shannon, 104 South Michigan Avenue, Chicago. He will be assisted by Robert Cummings, J.F. Delph, Frank Fowler, F.P. Hammond, Robert Hawkins, J.H. Hutton, G.E. Johnson, H.E. Mock, H.K. Nicoll, H.P. Saunders and Paul Vermeren.

Application for Membership

The Chicago Tournament will give an opportunity to old and new Fellows to enjoy a wonderful day of golf, to win a nice prize and to join in the famous good-fellowship of the American Medical Golfing Association.

All male Fellows of the American Medical Association are cordially invited to become Fellows of the American Medical Golfing Association; write Secretary Bill Burns, 2020 Olds Tower, Lansing 8, Mich., for application blank. Participants in the tournament are required to present their home club handicap, signed by the club secretary, or to accept a handicap set by the A.M.G.A. Handicap Committee. No handicap over 30 is allowed. All eighteen hole trophies and prizes are awarded on the basis of scores for the first eighteen holes played. A Fellow absent from the annual banquet following the tournament forfeits his rights to a trophy or prize.

American Medical Golfing Association Officers

Waltman Walters, Rochester, Minn., is President, W.C. Speidel, Seattle, is First Vice President and Director of Handicaps and Jean A. Gruhler, Atlantic City, N.J., is Second Vice President and Director of Arrangements. President Walters anticipates that approximately three hundred Fellows of the A.M.G.A. will play in the enjoyable Chicago tournament on Monday, June 21.

TELEVISION PROGRAM
June 21-25, 1948

A television program has been arranged by Northwestern University Medical School for each day of the Annual Session, as follows:

	Monday	Tuesday	Wednesday	Thursday	Friday
9 a.m.	Roentgen Ray Injuries	Congenital Cardiac Anomalies	Obstetrics and Gynecology	Problems of Lower Genitourinary Tract	Adult Chest and Cardiac Clinic
	Michael L. Mason	Stanley Gibson William Potts	Arthur Curtis George Gardner John Brewer James Fitzgerald Chester Doherty	Vincent O'Conor Leander Riba Knowlton Barber	Don Sutton Chauncey Maher
10 a.m.				Parenteral Fluids	
				Walter Maddock Smith Freeman	
11 a.m.	Orthopedic Clinic			Anesthesia Demonstration	Endocrinology Clinic
	James K. Stack			Mary Karp Mary Frances Poe	M.D. Allweiss
1 p.m.	Early Skin Grafting in Burns	Tendon Suture	Peptic Ulcer	Peripheral Nerve Injuries	Hypertension and Sympathectomy
	Harvey Allen	Sumner L. Koch	Clifford Barborka Karl Meyer	Loyal Davis Lewis Pollock	Howard Lindberg John Martin
3	Examination of the Back	Suction Limb Prostheses	Physical Therapy Demonstrations	Medical Neurology	Dermatologic Demonstrations
	Philip Lewin	Clinton Compere	Stafford S. Osborne	Benjamin Boshes Alex Arieff	E. A. Oliver and associates

PRELIMINARY PROGRAM OF THE SCIENTIFIC ASSEMBLY

GENERAL SCIENTIFIC MEETINGS

Auditorium, Navy Pier (Room 6)

MONDAY, JUNE 21, 2:00 P. M.

Charles H. Phifer, Member,
Council on Scientific Assembly, Presiding

Practical Clinical Applications of Current Pharmacology.
Chauncey D. Leake, Galveston, Texas.

Principles of Endocrine Therapy.
Allan T. Kenyon, Chicago.

Cytologic Method in the Early Diagnosis of Cancer.
Maurice Fremont-Smith, Boston.

TUESDAY, JUNE 22, 9:00 A. M.

L. W. Larson, Member,
Council on Scientific Assembly, Presiding

Present Status of Narcotic Addiction, with Particular Reference to Medical Indications and Comparative Addiction Liability of the Newer and Older Narcotic Drugs.
Victor H. Vogel, Lexington, Ky.

Ordeals of Public Health.
Hernan Romero, Santiago, Chile.

11:00 A. M.

Stanley P. Reimann, Member,
Council on Scientific Assembly, Presiding

Physician's Obligation When Death Has Resulted From Violent or Obscure Causes.
Alan R. Moritz, Boston.

Blood Transfusion in Medical and Surgical Practice.
Everett Evans, Richmond, Va.

Clinical Uses of Blood Derivatives.
Charles A. Janeway, Boston.

TUESDAY, JUNE 22, 2:00 P. M.

Henry R. Viets, Chairman

Atomic Energy and Medicine.
Lewis L. Strauss, Washington, D. C.

Isotopes for Medicine.
Paul C. Aebersold, Oak Ridge, Tenn.

Isotopes and Internal Radiation.
Joseph G. Hamilton, Berkeley, Calif.

Medical Aspects of the Atomic Bomb.
Stafford L. Warren, Los Angeles.

Medical Program of the Atomic Energy Commission.
Shields Warren, Boston.

THE INAUGURATION MEETING

Ballroom, Hotel Stevens

TUESDAY, JUNE 22, 8 p.m.

Music.

Call to Order by the President, Edward L. Bortz.

Invocation.

Music.

Announcements.
Warren W. Furey, Chairman,
Local Committee on Arrangements.

Music.

Introduction and Installation of President-Elect
R. L. Sensenich.

Address.
R. L. Sensenich, President.

Music.

Presentation of Medal to Retiring President,
Edward L. Bortz.
Elmer L. Henderson, Chairman, Board of Trustees.

Presentation of Distinguished Service Medal.
R. L. Sensenich, President.

Music.

THE PROGRAMS OF THE SECTIONS

Outline of the Scientific Proceedings—The Preliminary Program and the Official Program

The following papers are announced to be read before the various sections. The order here is not necessarily the order that will be followed in the Official Program, nor is the list complete. The Official Program will be similar to the programs issued in previous years and will contain the final program of each section with abstracts of the papers, as well as lists of committees, program of the General Meeting, list of entertainments and other information. To prevent misunderstandings and protect the interest of advertisers, it is here announced that this Official Program will contain no advertisements. It is copyrighted by the American Medical Association and will not be distributed before the session. A copy will be given to each Fellow on registration.

SECTION ON INTERNAL MEDICINE

MEETS IN AUDITORIUM, NAVY PIER (ROOM 6)

OFFICERS OF SECTION

Chairman—Cecil J. Watson, Minneapolis.

Vice Chairman—James A. Greene, Houston, Texas.

Secretary—Walter L. Palmer, Chicago.

Executive Committee—William D. Stroud, Philadelphia; Joseph T. Wearn, Cleveland; Cecil J. Watson, Minneapolis.

Wednesday, June 23—2 p. m.

The Therapy of Migraine, (Lantern Demonstration).
Robert Marcussen and Harold G. Wolff, New York.

What is Psychotherapy?
Henry M. Thomas Jr., Baltimore.

The Treatment of Pernicious Anemia (Lantern Demonstration).
Russell L. Haden and Donald W. Bortz, Cleveland.

Selection of Therapy for Individual Patients with Thyrotoxicosis.
Robert H. Williams, Boston.

The Frank Billings Lecture: Protein Comes Into Its Own.
James S. McLester, Birmingham, Ala.

The Furtherance of Diabetes Therapy (Lantern Demonstration).
Elliott P. Joslin, Boston.

Thursday, June 24—2 p.m.

Election of Officers

Prognosis of Acute Myocardial Infarction (Lantern Demonstration).
F. Tremaine Billings Jr., Bernard M. Kalstone, James L. Spencer and George R. Meneely, Nashville, Tenn.

The Mechanism and Treatment of Renal Dysfunction in Chronic Congestive Heart Failure (Lantern Demonstration).
Louis Leiter, Reuben Mokotoff, Raymond Weston, Doris J. W. Escher, Leon Hellman and Martin Cherkasky, New York.

Chairman's Address (Lantern Demonstration).
Cecil J. Watson, Minneapolis.

Sarcoidosis (Lantern Demonstration).
Edward S. Ray, Richmond, Va.

The Value of Cytologic Study of Sputum and Bronchial Secretions in the Diagnosis of Carcinoma of the Lung (Lantern Demonstration).
John R. McDonald and Lewis B. Woolner, Rochester, Minn.

Discontinuous Therapy with Penicillin (Lantern Demonstration).
Ralph Tompsett, Alphonse Timpanelli and Walsh McDermott, New York.

Friday, June 25—9 a.m.

JOINT MEETING WITH SECTION ON EXPERIMENTAL MEDICINE AND THERAPEUTICS IN ROOM 4, NAVY PIER

Report of Committee for the Evaluation of the Use of Anticoagulants in the Treatment of Coronary Thrombosis with Myocardial Infarction (Lantern Demonstration).
Irving S. Wright, Chairman, and Charles D. Marple, Executive Secretary of Committee, New York.

Pathogenesis of Arterial Hypertension.
Irvine H. Page, Cleveland.

Psychologic Aspects of Arterial Hypertension.
George Saslow, St. Louis.

Laboratory Studies in Man of Drugs Recently Introduced for the Relief of Essential Hypertension (Lantern Demonstration).
Robert W. Wilkins, Boston.

The Effect of Low Salt Diets on Arterial Hypertension: A Comparison of the Effects of Low Salt and Rice Diets in the Treatment of Arterial Hypertension (Lantern Demonstration).
Henry A. Schroeder, St. Louis.

Review of Fifteen Years' Experience with Sympathectomy in the Treatment of Hypertension at Massachusetts General Hospital.
Kenneth A. Evelyn, London, Ontario, Canada.

SECTION ON SURGERY, GENERAL AND ABDOMINAL

MEETS IN BALLROOM, SHERATON HOTEL

OFFICERS OF SECTION

Chairman—B. Noland Carter, Cincinnati.

Vice Chairman—Warren H. Cole, Chicago.

Secretary—Michael E. DeBakey, New Orleans

Executive Committee—Daniel C. Elkin, Atlanta, Ga.; Alton Ochsner, New Orleans; B. Noland Carter, Cincinnati.

Wednesday, June 23—9 a. m.

Factors Contributing to Low Mortality in Appendectomy for Acute Appendicitis: A Ten Year Study (Lantern Demonstration).
Arthur B. McGraw, Detroit.
Discussion to be opened by Frederick F. Boyce, New Orleans, and Max M. Zinninger, Cincinnati.

The Treatment of Acute Septic Peritonitis (Lantern Demonstration.)
William A. Altemeier, Cincinnati.
Discussion to be opened by Champ Lyons, New Orleans; John S. Lockwood, New York, and Edwin J. Pulaski, San Antonio, Texas.

Acute Obstruction of the Small Bowel (Lantern Demonstration).
Robert W. Buxton and Frederick A. Coller, Ann Arbor, Mich.
Discussion to be opened by Owen H. Wangensteen, Minneapolis, and Charles G. Johnston, Detroit.

Acute Obstruction of the Colon (Lantern Demonstration).
Marshall L. Michel, New Orleans.
Discussion to be opened by Clarence Dennis, Minneapolis, and George V. Brindley, Temple, Texas.

The Rationale and Value of Combined (One Stage) Splenectomy and Portocaval Shunts in Portal Hypertension: Observations on Venous Shunts in the Postsplenectomy Patient with Recurring Hemorrhage.
Louis M. Rousselot, New York.
Discussion to be opened by Robert M. Zollinger, Columbus, Ohio, and Robert R. Linton, Brookline, Mass.

Empyema (Lantern Demonstration).
Brian B. Blades, Washington, D. C.
Discussion to be opened by Edward M. Kent, Pittsburgh, and Thomas H. Burford, St. Louis.

Thursday, June 24—9 a. m.

Election of Officers

Chairman's Address: The Present Status of Surgery of the Heart and Associated Great Vessels (Lantern Demonstration).
B. Noland Carter, Cincinnati.

The Incidence of Malignant Tumors of the Thyroid (Lantern Demonstration).
George Crile Jr., Cleveland.
Discussion to be opened by Charles W. Mayo, Rochester, Minn., and Warren H. Cole, Chicago.

Hyperthyroidism (Lantern Demonstration).
I. S. Ravdin and Edward Rose, Philadelphia.
Discussion to be opened by Harold L. Foss, Danville, Pa., and Warren H. Cole, Chicago.

Hypertension: Evaluation of Treatment (Lantern Demonstration).
Winchell McK. Craig, Rochester, Minn.
Discussion to be opened by Geza de Takats, Chicago, and James L. Poppen, Boston.

Acute Arterial Injuries (Lantern Demonstration).
Norman E. Freeman, San Francisco.
Discussion to be opened by Frederick W. Cooper, Emory University, Ga.; Harris B. Shumacker Jr., Baltimore, and Geza de Takats, Chicago.

Surgical Treatment for Coarctation of the Aorta (Lantern Demonstration).
Robert E. Gross, Boston.
Discussion to be opened by Willis J. Potts, and Richard B. Capps, Chicago.

Friday, June 25—9 a. m.

JOINT MEETING WITH SECTION ON GASTRO-ENTEROLOGY AND PROCTOLOGY

Newer Aspects of the Treatment of Ulcer (Lantern Demonstration).
A. H. Aaron, Buffalo.

Vagotomy (Lantern Demonstration).
Keith S. Grimson, R. W. Rundles, George J. Baylin and H. M. Taylor, Durham, N. C.
Discussion on papers of Dr. Aaron and Drs. Grimson, Rundles, Baylin and Taylor to be opened by Lester R. Dragstedt, Chicago; Francis D. Moore, Boston; A. C. Ivy, Chicago; Waltman Walters, Rochester, Minn., and Walter L. Palmer, Chicago.

Nonspecific Inflammatory Lesions of the Terminal Ileum and Colon.
Russell S. Boles, Philadelphia.

Nonspecific Inflammatory Lesions of the Small and Large Bowel (Lantern Demonstration).
Leland S. McKittrick, Boston.
Discussion on papers of Drs. Boles and McKittrick to be opened by Clarence Dennis, Minneapolis; Burrill B. Crohn, New York; Lester R. Dragstedt, Chicago, and Everett D. Kiefer, Boston.

Diagnosis of Carcinoma of the Colon and Rectum (Lantern Demonstration).
Neil W. Swinton, Hugh F. Hare and William A. Meissner, Boston.
Discussion to be opened by Harry M. Weber, Rochester, Minn., and William H. Daniel, Los Angeles.

SECTION ON OBSTETRICS AND GYNECOLOGY

MEETS IN BALLROOM, SHERATON HOTEL

OFFICERS OF SECTION

Chairman—William F. Mengert, Dallas, Texas

Vice Chairman—Robert L. Faulkner, Cleveland.

Secretary—Arthur B. Hunt, Rochester, Minn.

Executive Committee—Philip F. Williams, Philadelphia; Alice F. Maxwell, San Francisco; William F. Mengert, Dallas, Texas.

Wednesday, June 23—2 p. m.

The Management of Occiput Posterior Position (Lantern Demonstration).
Gerald W. Gustafson, Indianapolis.
Discussion to be opened by Edward L. Cornell, Chicago, and Gerald Rogers, Oklahoma City.

Report of a Ten Year Experiment in the Control of Cancer of the Uterus (Lantern Demonstration).
Catherine MacFarlane, Philadelphia.
Discussion to be opened by B. Z. Cashman, Pittsburgh, and Augusta Webster, Chicago.

Unusual Experiences in the Practice of Obstetrics and Gynecology in China.
Goodrich C. Schauffler, Portland, Ore.
Discussion to be opened by Frank E. Whitacre, Memphis, Tenn.

Panel Discussion on Endometriosis

Joe V. Meigs, Boston, Moderator.

Diagnosis and Medical Management (Lantern Demonstration).
Francis B. Carter, Durham, N. C.

Conservative Surgical Treatment in Young Women (Lantern Demonstration).
Clayton T. Beecham, Philadelphia.

Management of Complications of Endometriosis (Lantern Demonstration).
Clyde L. Randall, Buffalo.

Thursday, June 24—2 p. m.

Election of Officers

Chairman's Address: Estimation of Pelvic Capacity (Lantern Demonstration).
William F. Mengert, Dallas, Texas.

Culdoscopy (Lantern Demonstration).
Albert Decker, New York.
Discussion to be opened by Richard W. TeLinde Baltimore.

Pseudomalignant Changes in the Cervix During Pregnancy (Lantern Demonstration).
Wilson Footer, Oakland, Calif.

Panel Discussion on Obstetric Hemorrhage

Charles A. Gordon, Brooklyn, Moderator.

Antipartum and Intrapartum Obstetric Hemorrhage.
Bernard J. Hanley, Los Angeles.

Postpartum Hemorrhage.
Russell J. Moe, Duluth, Minn.

Precautions to be taken on Blood Transfusion.
Joseph M. Hill, Dallas, Texas.

Precautions in the Use of Plasma in Obstetric Hemorrhage, with Special Reference to the Causation of Hepatitis (Lantern Demonstration).
Frederick W. Hoffbauer, Minneapolis.

Friday, June 25—9 a. m.

JOINT MEETING WITH SECTION ON PEDIATRICS IN AUDITORIUM, NAVY PIER (ROOM 6)

Panel Discussion on Fetal Anoxia at Birth (Cyanosis of the Newborn)

C. Anderson Aldrich, Rochester, Minn., Moderator.

Physiologic Background of Fetal Anoxia at Birth.
Clement A. Smith, Boston.

Prevention of Fetal Anoxia at Birth (Lantern Demonstration).
Nicholson J. Eastman, Baltimore.

Differential Diagnosis and Management of Fetal Anoxia at Birth.
Stewart H. Clifford, Boston.

Pathology of Conditions in which Fetal Anoxia at Birth is an Outstanding Feature (Lantern Demonstration).
W. W. Zuelzer, Detroit.

Rh-Negative Offspring of Immunized Mothers (Lantern Demonstration).
Edwin L. Kendig, Richmond, Va.
Discussion to be opened by S. A. Cosgrove, Jersey City, N. J., and J. Buren Sidbury, Wilmington, N. C.

Emergencies Encountered in the Neonatal Period (Lantern Demonstration).
M. Hines Roberts, Atlanta, Ga.
Discussion to be opened by Fred L. Adair, Chestertown, Ind., and Nina A. Anderson, Cincinnati.

Ovarian Tumors in Childhood (Lantern Demonstration).
Harold W. Dargeon, New York.
Discussion to be opened by Goodrich C. Schauffler, Portland, Ore.

SECTION ON OPHTHALMOLOGY

MEETS IN THORNE HALL, NORTHWESTERN UNIVERSITY

OFFICERS OF SECTION

Chairman—Everett L. Goar, Houston, Texas.

Vice Chairman—Francis Heed Adler, Philadelphia.

Secretary—Trygve Gundersen, Boston.

Executive Committee—Frederick C. Cordes, San Francisco; Derrick Vail, Chicago; Everett L. Goar, Houston, Texas.

Wednesday, June 23—9 a. m.

Chairman's Address (Lantern Demonstration).
Everett L. Goar, Houston, Texas.

Address.
John A. MacMillan, Montreal, Canada.

Retrolental Fibroplasia and Persistent Hyperplastic Primary Vitreous: Two Entities (Lantern Demonstration).
Algernon B. Reese, New York.
Theodore H. Ingalls, Southborough, Mass.

Treatment of Glaucoma Associated with Iridocyclitis.
Adolph Posner and Abraham Schlossman, New York.

The Use of Strips of Orbicularis Oculi Muscles in Surgery of the Eyelids (Lantern Demonstration).
William B. Clark, New Orleans.

Thursday, June 24—9 a. m.

Election of Officers

Verified Refraction (Lantern Demonstration).
S. Judd Beach, Portland, Maine.

Intraorbital Tumors.
Arnold W. Forrest, New York.

The Use of "D.F.P." (Diisopropyl Fluorophosphate) in Glaucoma: Evaluation of Results over a Three Year Period (Lantern Demonstration).
P. Robb McDonald and Irving H. Leopold, Philadelphia.

The Blind Spot Syndrome (Lantern Demonstration).
Kenneth C. Swan, Portland, Ore.

Friday, June 25—9 a. m.

Nonmedical Problems in Industrial Ophthalmology.
Ralph S. McLaughlin, Charleston, W. Va.

The Use of Streptomycin and Streptomycin plus "Promizole" in Experimental Ocular Tuberculosis (Lantern Demonstration).
Alan C. Woods, Baltimore.

A Method of Retrobulbar Anesthesia Which Produces an Associated Motor Block of the Extraocular Muscles (Lantern and Motion Picture Demonstration).
Harold Gifford Jr., Omaha.

Basic Principles of Ocular Muscle Surgery.
Watson Gailey, Bloomington, Ill.

A Further Exceedingly Delicate Test for Astigmatic Axis (Lantern Demonstration).
William H. Crisp, Denver, and George H. Stine, Colorado Springs, Colo.

SECTION ON LARYNGOLOGY, OTOLOGY AND RHINOLOGY

MEETS IN THORNE HALL, NORTHWESTERN UNIVERSITY

OFFICERS OF SECTION

Chairman—Fletcher D. Woodward, Charlottesville, Va.

Vice Chairman—John R. Simpson, Pittsburgh.

Secretary—J. Milton Robb, Detroit.

Executive Committee—Louis H. Clerf, Philadelphia; J. Mackenzie Brown, Los Angeles; Fletcher D. Woodward, Charlottesville, Va.

Wednesday, June 23—2 p. m.

Inhalation of Nebulized Aerosols in Office Practice (Lantern Demonstration).
David Davis, Washington, D. C.
Discussion to be opened by Alvan L. Barach, New York, and Maurice S. Segal, Boston.

The Symptomatic Elongated Styloid Process (Lantern Demonstration).
Watt W. Eagle, Durham, N. C.
Discussion to be opened by C. M. Kos, Iowa City, and O. E. Van Alyea, Chicago.

Rehabilitation of the Larynx in Cases of Bilateral Abductor Paralysis: A Report of the Past Four Years' Experience with the Open Approach to Arytenoidectomy for Relief of Bilateral Abductor Paralysis (Lantern Demonstration).
De Graaf Woodman, New York.
Discussion to be opened by Paul H. Holinger, Chicago, and Fletcher D. Woodward, Charlottesville, Va.

Differential Diagnosis of Oral Lesions (Lantern Demonstration).
Russell A. Sage, Indianapolis.
Discussion to be opened by Le Roy A. Schall, Boston, and Charles D. Blassingame, Memphis, Tenn.

Transtympanic Fenestration; the Final Technic. Fenestration and the Hydrodynamic Hypothesis: Its Practical Implications.
O. Popper, Johannesburg, South Africa.
Discussion to be opened by Douglas Carruthers, Sydney, Australia, and A. L. Juers, Chicago.

Thursday, June 24—2 p. m.

Executive Session

Election of Officers

Chairman's Address: A Medical Criticism of Automotive Engineering (Lantern Demonstration).
Fletcher D. Woodward, Charlottesville, Va.

The Management of Acute Laryngotracheobronchitis (Lantern Demonstration).
John R. Simpson, Pittsburgh.
Discussion to be opened by Louis H. Clerf, Philadelphia, and Paul H. Holinger, Chicago.

Laryngectomy: A Surgical Technic Which Promotes Rapid Healing (Lantern and Motion Picture Demonstration).
John B. Erich, Rochester, Minn.
Discussion to be opened by Henry B. Orton, Newark, N. J., and Le Roy A. Schall, Boston.

Lymphoid Eustachian Salpingitis: Selective Criteria for Radiation Therapy (Lantern Demonstration).
J. Brown Farrior, Tampa, Fla.
Discussion to be opened by Gilbert E. Fisher, Birmingham, Ala., and John R. Lindsay, Chicago.

Blast Injuries to the Ear (Texas City Disaster).

George S. McReynolds, Fred R. Guilford and G. R. Chase, Galveston, Texas.

Discussion to be opened by John S. Knight, Kansas City, Mo., and Paul A. Campbell, Chicago.

Friday, June 25—2 p. m.

Surgery of the Chronic Ear by the Endaural Approach (Motion Picture Demonstration).

Howard P. House, Los Angeles.

Discussion to be opened by John F. Tolan, Seattle, and James E. Croushore, Detroit.

The Interpretation of Hearing Tests (Lantern Demonstration).

Stacy R. Guild, Baltimore.

Discussion to be opened by A. C. Furstenberg, Ann Arbor, Mich., and L. R. Boies, Minneapolis.

The Sphenopalatine Ganglion: Anatomy, Function and Symptomatology (Lantern Demonstration).

David R. Higbee, San Diego, Calif.

Discussion to be opened by William E. Grove, Milwaukee, and W. Likely Simpson, Memphis, Tenn.

Cancer of the Larynx: Five Year End Results in Series of Five Hundred Cases, with Special Study of Those Developing Recurrence or Metastasis (Lantern Demonstration).

Chevalier L. Jackson, John V. Blady, Charles Norris and Walter Maloney, Philadelphia.

Discussion to be opened by Gordon B. New, Rochester, Minn., and Hayes Martin, New York.

SECTION ON PEDIATRICS

MEETS IN AUDITORIUM, NAVY PIER (ROOM 6)

OFFICERS OF SECTION

Chairman—Oscar Reiss, Los Angeles.

Vice Chairman—Stanley Gibson, Chicago.

Secretary—Margaret Mary Nicholson, Washington D.C.

Executive Committee—John Aikman, Rochester, N. Y.; Gilbert J. Levy, Memphis, Tenn.; Oscar Reiss, Los Angeles.

Wednesday, June 23—9 a. m.

American Q Fever, (Lantern Demonstration).

R. J. Huebner, W. L. Jellison and M. Dorothy Beck, Hondo, Calif.

Primary Virus Pneumonia in Infants (Lantern Demonstration).

John M. Adams, Minneapolis.

Discussion to be opened by C. B. Conklin, Washington, D. C.

Virus Encephalitis (Lantern Demonstration).

Russell J. Blattner, Houston, Texas.

Discussion to be opened by Herbert A. Wenner, Kansas City, Kan.

Clinical Manifestations of Infection with Poliomyelitis Virus.

Albert E. Casey, Birmingham, Ala., and William I. Fishbein, Francis B. Gordon and Frank M. Schabel Jr., Chicago, under the direction of Herbert N. Bundesen, Chicago.

Enteral Treatment of Diarrhea in Infancy (Lantern Demonstration).

Edward Scott O'Keefe, Lynn, Mass.

Reaction to Whooping Cough Vaccination.

John A. Toomey, Cleveland.

Thursday, June 24—9 a. m.

Election of Officers

Epilepsy in Childhood (Lantern Demonstration).

M. G. Peterman, Milwaukee.

The Reduction and Prevention of Poisoning Accidents in Children (Lantern Demonstration).

John Aikman, Rochester, N. Y

Jet Injection in Pediatric Practice (Lantern Demonstration).

James G. Hughes, Robert G. Jordan and Fontaine S. Hill, Memphis, Tenn.

Discussion to be opened by Robert A. Hingson, Memphis, Tenn.

The Class Room as a Factor in Growth Deviation.

Darell Boyd Harmon, Austin, Texas.

Aplastic Anemia in Children, Report of a Case with Treatment by Splenectomy.

Arthur F. Abt, Chicago.

Streptomycin Therapy in Tuberculous Meningitis (Lantern Demonstration).

Abraham Levinson, Chicago.

Discussion to be opened by William S. Hoffman, Chicago.

Newer Concepts of the Etiology and Management of Idiopathic Ulcerative Colitis (Lantern Demonstration)

Sidney A. Portis, Chicago

Friday, June 25—9 a. m.

JOINT MEETING WITH SECTION ON OBSTETRICS AND GYNECOLOGY

Panel Discussion on Fetal Anoxia at Birth (Cyanosis of the Newborn).

C. Anderson Aldrich, Rochester, Minn., Moderator.

Physiologic Background of Fetal Anoxia at Birth.

Clement A. Smith, Boston.

Prevention of Fetal Anoxia at Birth (Lantern Demonstration).

Nicholson J. Eastman, Baltimore.

Differential Diagnosis and Management of Fetal Anoxia at Birth.

Stewart H. Clifford, Boston.

Pathology of Conditions in Which Fetal Anoxia at Birth is an Outstanding Feature. (Lantern Demonstration).

W. W. Zuelzer, Detroit.

Rh Negative Offspring of Immunized Mothers (Lantern Demonstration).

Edwin L. Kendig, Richmond, Va.

Discussion to be opened by Herbert F. Traut, San Francisco; S. A. Cosgrove, Jersey City, N.J., and J. Buren Sidbury, Wilmington, N.C.

Emergencies Encountered in the Neonatal Period (Lantern Demonstration).

M. Hines Roberts, Atlanta, Ga.

Discussion to be opened by Fred L. Adair, Chestertown, Ind., and Nina A. Anderson, Cincinnati.

Ovarian Tumors in Childhood (Lantern Demonstration).

Harold W. Dargeon, New York.

Discussion to be opened by Goodrich C. Schauffler, Portland, Ore.

SECTION ON EXPERIMENTAL MEDICINE AND THERAPEUTICS

MEETS IN ROOM 4, NAVY PIER

OFFICERS OF SECTION

Chairman—Walter Bauer, Boston.

Vice Chairman—Dwight L. Wilbur, San Francisco.

Secretary--Carl V. Moore, St. Louis

Executive Committee—E. V. Allen, Rochester, Minn.; Carl A. Dragstedt, Chicago; Walter Bauer, Boston.

Wednesday, June 23--9 a.m.

Fat in Parenteral Nutrition (Lantern Demonstration).
Frederick J. Stare, Boston

Antibody Response in Patients with Hypoproteinemia, with Special Reference to the Effect of Protein Hydrolysate Supplementation (Lantern Demonstration).
Michael G. Wohl, John G. Reinhold, S. Brandt Rose, L. Ashby Adams and Wells F. Harvey, Philadelphia.

Clinical Significance of the Electrolyte Composition of Sweat in Abnormalities of Adrenal Cortical Function (Lantern Demonstration).
Jerome W. Conn, Ann Arbor, Mich.

The Specific Treatment of Brucellosis with a Combination of Streptomycin and a Sulfonamide Compound (Lantern Demonstration).
Wesley W. Spink, Wendell H. Hall, James M. Shaffer and Abraham I. Braude, Minneapolis.

Studies Concerning Oral Penicillin in Patients with Rheumatic Fever (Lantern Demonstration).
Benedict F. Massell, James W. Dow and T. Duckett Jones, Boston.

New Penicillin Products for Sustained Effects (Lantern Demonstration).
Leo Loewe, Albert E. Sobel and Erna Alturr-Werber, Brooklyn.

Thursday, June 24--9 a.m.

Election of Officers

Chairman's Address (Lantern Demonstration).
Walter Bauer, Boston.

The Cure of Recurrent Vivax Malaria with Pentaquine (Lantern Demonstration).
L. T. Coggeshall, Chicago.

Treatment of Hemophilia with Plasma Fraction I (Lantern Demonstration).
Louis K. Diamond, Boston.

Studies on the Circulation with the Use of Radioactive Tracers.
Myron Prinzmetal, Beverly Hills, Calif.

The Influence of "Dibenamine" on the Function of the Sympathetic Nervous System in Man.
Hans H. Hecht and Ferne S. Focht, Salt Lake City.

Friday, June 25--9 a.m.

JOINT MEETING WITH SECTION ON INTERNAL MEDICINE

Report of Committee for the Evaluation of the Use of Anticoagulants in the Treatment of Coronary Thrombosis with Myocardial Infarction (Lantern Demonstration).
Irving S. Wright, Chairman, and Charles D. Marple, Executive Secretary of Committee, New York.

Pathogenesis of Arterial Hypertension.
Irvine H. Page, Cleveland.

Psychologic Aspects of Arterial Hypertension.
George Saslow, St. Louis.

Laboratory Studies in Man of Drugs Recently Introduced for the Relief of Essential Hypertension (Lantern Demonstration).
Robert W. Wilkins, Boston.

The Effect of Low Salt Diets on Arterial Hypertension: A Comparison of the Effects of Low Salt and Rice Diets in the Treatment of Arterial Hypertension (Lantern Demonstration).
Henry A. Schroeder, St. Louis.

Review of Fifteen Years' Experience with Sympathectomy in the Treatment of Hypertension at Massachusetts General Hospital.
Kenneth A. Evelyn, London, Ontario, Canada.

SECTION ON PATHOLOGY AND PHYSIOLOGY

MEETS IN ROOM 4, NAVY PIER

OFFICERS OF SECTION

Chairman--Alvin G. Foord, Pasadena, Calif.

Vice Chairman--George E. Wakerlin, Chicago.

Secretary--Edwin F. Hirsch, Chicago

Executive Committee--Virgil H. Moon, Philadelphia; J. J. Moore, Chicago; Alvin G. Foord, Pasadena, Calif.

Wednesday, June 23--2 p.m.

Hypertension (Lantern Demonstration).
George E. Wakerlin, Chicago

Discussion to be opened by Louis N. Katz, Chicago, and Caroline C. B. Thomas, Baltimore.

Bright's Disease (Lantern Demonstration).
E. T. Bell, Minneapolis.

Recent Advances in Nutrition.
Ancel Keys, Minneapolis.

Discussion to be opened by J. B. Youmans, Chicago, and Tom D. Spies, Birmingham, Ala

Clinical Problems in Fluid Balance (Lantern Demonstration).
Edward Muntwyler, Brooklyn.

Discussion to be opened by W. S. Hoffman and D. A. MacFadyen, Chicago.

Thursday, June 24--2 p.m.

Election of Officers

Disorders of the Liver (Lantern Demonstration)
H. T. Karsner, Cleveland

Discussion to be opened by H. P. Popper and Richard B. Capps, Chicago.

Cancer Problems in Practice (Lantern Demonstration).
Stanley P. Reimann, Philadelphia.

Discussion to be opened by J. J. Moore and J. P. Simonds, Chicago.

Recent Advances in Gastrointestinal Physiology (Lantern Demonstration).
J. E. Thomas, Philadelphia.

Discussion to be opened by A. C. Ivy and Heinrich Necheles, Chicago.

New Developments in Endocrinology (Lantern Demonstration).
Warren O. Nelson, Iowa City.

Discussion to be opened by A. J. Carlson and S. Soskin, Chicago.

Friday, June 25--2 p.m.

Chairman's Address: Embolism in Coronary Heart Disease (Lantern Demonstration).
Alvin G. Foord, Pasadena, Calif.

Hippocrates and the Beanstalk (Lantern Demonstration).
Philip R. White, Philadelphia.

The Pathogenesis of Toxoplasmosis (Lantern Demonstration).
J. K. Frenkel, San Francisco

Cholesterol Metabolism and Its Relation to Atherosclerosis, Coronary Artery Disease, and Arteriosclerosis (Lantern Demonstration).
Chaney and William Gonzales, Los Angeles.

The Mechanism of Streptomycin Action in Tuberculosis (Lantern Demonstration).
Harry J. Corper and Maurice L. Cohn, Denver.

SECTION ON NERVOUS AND MENTAL DISEASES

MEETS IN ROOM 3, NAVY PIER

OFFICERS OF SECTION

Chairman--A. R. Vonderahe, Cincinnati.

Vice Chairman--William A. Smith, Atlanta, Ga.

Secretary--Frederick P. Moersch, Rochester, Minn.

Executive Committee--Perciva1 Bailey, Chicago; Roland P. Mackay, Chicago; A. R. Vonderahe, Cincinnati.

Wednesday, June 23--9 a.m.

Present Day Status of Medical Psychologic Aspects of Alcoholism.
Robert V. Seliger, Baltimore.

Psychiatric Problems in a Thyroid Clinic.
John C. Whitehorn and Theodore Lidz, Baltimore.

Analysis of Treatment in a Psychosomatic Clinic (Lantern Demonstration).
H. S. Ripley and Stewart G. Wolf, New York.

Psychosomatic Studies in Narcolepsy (Lantern Demonstration).
H. C. Modlin, Topeka, Kan., and H. H. Jasper and W. D. Ross, Montreal, Canada.

Psychiatry in Clinical Medicine.
Howard P. Rome, Rochester, Minn.

Congenital Universal Indifference to Pain (Lantern and Motion Picture Demonstration).
David A. Boyd Jr. and Louis W. Nie, Indianapolis.

Experience with Electronarcosis (Lantern Demonstration).
Douglas Goldman, Cincinnati.

Thursday, June 24--9 a.m.

Business Meeting

Election of Officers

Chairman's Address: Neuroanatomy and Its Relationship to the Medical Sciences.
A. R. Vonderahe. Cincinnati.

Cerebellar Seizures Experimentally Elicited (Lantern Demonstration).
Sam L. Clark, Nashville, Tenn.

Angiography in the Diagnosis and Treatment of Cerebral Hemorrhage (Lantern Demonstration).
I. S. Wechsler and Sidney W. Gross, New York.

The Specific Therapy of Bacterial Infections of the Central Nervous System (Lantern Demonstration).
Harry F. Dowling, Washington, D. C.

Cerebral Changes in Diabetes Mellitus (Lantern Demonstration).
Russell N. DeJong, Ann Arbor, Mich.

The Symptomatic Treatment of Certain Types of Headaches (Lantern Demonstration).
Arnold P. Friedman, Charles Brenner and Sidney Carter, New York.

Friday, June 25--9 a.m.

Congenital Dermal Sinuses as a Cause of Meningitis, Intraspinal Abscess and Intracranial Abscess (Lantern Demonstration).
Lester A. Mount, New York

Interruption of the Sympathetic Nerve Supply to the Brain: Effect on Parkinson's Syndrome.
W. James Gardner and Guy H. Williams, Cleveland.

Frontal Lobotomy for Intractable Pain.
John B. Dynes and James L. Poppen, Boston.

Sciatica After Three to Eight Years (Lantern Demonstration).
Dean H. Echols, New Orleans.

Studies of Intracranial Tumors Employing Radioactive Isotopes: I. Concentration of P^{32} by Cerebral Tumors (Lantern Demonstration).
Bertram Selverstone and A. K. Solomon, Boston.

Scoliosis as a Manifestation of Disease of the Spinal Cord (Lantern Demonstration).
Edwin B. Boldry, John E. Adams and Howard A. Brown, San Francisco.

SECTION ON DERMATOLOGY AND SYPHILOLOGY

MEETS IN ROOM 1, NAVY PIER

OFFICERS OF SECTION

Chairman—Henry E Michelson, Minneapolis.

Vice Chairman—Carroll S. Wright, Philadelphia

Secretary—Clinton W Lane, St. Louis

Executive Committee—Clyde L. Cummer, Cleveland; Nelson Paul Anderson, Los Angeles; Henry E. Michelson, Minneapolis

Wednesday, June 23--9 a.m.

Chairman's Address: Criteria for the Diagnosis of Certain Tuberculoderms (Lantern Demonstration).
Henry E. Michelson, Minneapolis.

The Clinical Value of the Kveim Test in Sarcoidosis.
Carl T. Nelson, New York.

A Histologic Comparison of Micropapular Tuberculid and Rosacea (Lantern Demonstration).
Carl W. Laymon and Eugene P. Schoch Jr., Minneapolis.

Textile Dermatitis in Males.
G.A. Grant Peterkin, Edinburgh, Scotland.

Contact Dermatitis of the Hands: Localization as a Means of Causative Diagnosis (Lantern Demonstration).
George L. Waldbott, Detroit.

Dermatitis of the Hands Due to Ingested Allergens.
Bernard H. Winston, Kansas City, Mo.

Some Practical Aspects of Gross Sensitization in Allergic Eczematous Dermatitis (Lantern Demonstration).
Rudolf L. Baer, New York.

Thursday, June 24--9 a.m.

Election of Officers

Present Status of Dermatologic Training.
Francis E. Senear, Chicago, and George M. Lewis and Frank E. Cormia, New York.

The Distinguished Lecture in Dermatology: Cutaneous Manifestations of Some Tropical Diseases (Lantern Demonstration).
Howard Fox, New York.

The Culture and Identification of Fungi as an Office Procedure (Lantern Demonstration).
J. Walter Wilson, Los Angeles.

Manual Epilation in the Treatment of Tinea Capitis (Lantern Demonstration).
John F. Wilson, Philadelphia.

Prevention of Syphilis: Treatment of Contacts During the Incubation Stage with Penicillin in Oil and Beswax; Bismuth Ethyl Camphorate and Oxophenarsine Hydrochloride (Lantern Demonstration).
Lee J. Alexander and Arthur G. Schoch, Dallas, Texas.

Essential Hirsutism, Dermatologic and Endocrine Considerations (Lantern Demonstration).
J. Lamar Callaway and E.C. Hamblen, Durham, N.C.

The Genetics of Xanthoma Tuberosum Multiplex (Lantern Demonstration).
Maurice T. Fliegelman, Charles F. Wilkinson Jr. and Eugene A. Hand, Ann Arbor, Mich.

Ehlers-Danlos Syndrome (Lantern Demonstration).
Sture A. Johnson, Madison, Wis., and Harold F. Falls, Ann Arbor, Mich.

Friday, June 25--9 a.m.

Pruritus Ani et Vulvae: Further Observations and Studies in Series of Five Hundred Patients (Lantern Demonstration).
W. Howard Hailey, Atlanta, Ga.

Management of the Emotional Factors in Localized Neurodermatitis.
W.R. Huebler, Youngstown, Ohio.

The Psychologic and Emotional Factors in Skin Diseases.
A.H. Gottesman and Karl A. Menninger, Topeka, Kan.

Rickettsialpox: A Systemic Disease with Dermatologic Manifestations (Lantern Demonstration).
John F. Daly, New York.

Porphyric Bullous Dermatosis (Lantern Demonstration).
Israel Zeligman, Baltimore.

Comparison of Bacitracin with Other Remedies for Local Pyogenic Infections (Lantern Demonstration).
J. Lowry Miller, New York.

The Treatment of Herpes Zoster Ophthalmicus with Convalescent Blood Serum (Lantern Demonstration).
Frederick T. Becker, Duluth, Minn.

SECTION ON PREVENTIVE AND INDUSTRIAL MEDICINE AND PUBLIC HEALTH

OFFICERS OF SECTION

Chairman—Robert H. Riley, Baltimore.

Vice Chairman—Oscar A. Sander, Milwaukee.

Secretary—Rutherford T. Johnstone, Los Angeles.

Executive Committee—E.L. Stebbins, Baltimore; Clarence O. Sappington, Chicago; Robert H. Riley, Baltimore.

Wednesday, June 23—2 p.m.

JOINT MEETING WITH SECTION ON GENERAL PRACTICE OF MEDICINE IN ROOM 2, NAVY PIER

Diagnosis and Treatment of Occupational Metal Poisoning.
Leonard Greenburg, New York.

Lead:

The Differential Diagnosis of Lead Poisoning: Accepted Laboratory Criteria (Lantern Demonstration).
Elston L. Belknap, Milwaukee.

The Treatment of Lead Poisoning. (Should One Attempt to "Store Lead" or to "Delead"?) (Lantern Demonstration).
William C. Wilentz, Perth Amboy, N.J.

The Industrial Solvents:

Their Physiologic Effect (Lantern Demonstration).
John H. Foulger, Wilmington, Del.

Diagnosis and Treatment.
Rex H. Wilson, Akron, Ohio.

The Pneumoconioses: Which Industrial Dusts Are Inert? Which are Harmful? Why (Lantern Demonstration)?
L. E. Hamlin, Chicago.

Common Occupational Skin Diseases (Lantern Demonstration).
Nelson Paul Anderson, Los Angeles.

PANEL DISCUSSION AND QUESTION AND ANSWER PERIOD, AUDIENCE PARTICIPATION, WITH R. T. JOHNSTONE, LOS ANGELES, AS MODERATOR AND THE CONTRIBUTORS TO THE JOINT PROGRAM AND DR. OSCAR A. SANDER, MILWAUKEE, AS SPEAKERS.

Thursday, June 24--2 p.m.

MEETS IN ROOM 5, NAVY PIER

Election of Officers

Chairman's Address.
Robert H. Riley, Baltimore

Discussion of a Proposal for a Specialty Board.
E. L. Stebbins, Baltimore.

Clinical Recovery in Advanced Pulmonary Tuberculosis Induced by Total Lung Rest in the Immobilizing Lung Chamber (Lantern Demonstration).

Alvan L. Barach, C. F. Herben, J. H. Cullen and A. Chesmore Eastlake Jr., New York.

Discussion to be opened by G. L. Bellis, Winnebago, Wis.

Official Medical Investigation of Death in the Interest of Public Safety (Lantern Demonstration).
Alan R. Moritz, Boston.

The Virginia Medical Examiner System: The Coroner vs. the State Medical Examiner.
Herbert S. Breyfogle, Richmond, Va.

A Public Health Approach to the Problem of Home Accidents During the Preschool Period.
Edward R. Schlesinger, Albany, N.Y.

Friday, June 25--9 a.m.

JOINT MEETING WITH SECTION ON RADIOLOGY
IN BOULEVARD ROOM, SHERATON HOTEL

*SYMPOSIUM ON THE NEWER ASPECTS
OF CERTAIN OCCUPATIONAL
DUST DISEASES*

Beryllium

Chemical and Clinical Aspects (Lantern Demonstration).
Willard F. Machle, New York.

Pathologic Aspects (Lantern Demonstration).
Arthur J. Vorwald, Saranac, N. Y.

Radiologic Aspects
Stanley A. Wilson, Salem, Mass.

Diatomite Pneumoconiosis (Diatomaceous Earth)

Clinical Aspects.
Walter M. Anderson, Lompoc, Calif.

Pathologic Aspects.
William H. Carnes, Baltimore.

Radiologic Aspects (Lantern Demonstration).
Reginald H. Smart, Los Angeles.

Bauxite (Shaver's Disease)

Chemical and Physical Factors.
C. M. Jephcott, Niagara, Canada

Pathologic Aspects.
A. R. Riddell, Toronto, Canada.

Clinical and Radiologic Aspects (Lantern Demonstration).
C. G. Shaver, Niagara, Canada.

PANEL DISCUSSION, QUESTION AND ANSWER PERIOD, WITH AUDIENCE PARTICIPATION, WITH ARTHUR J. VORWALD, SARANAC, N. Y., AS MODERATOR AND THE CONTRIBUTORS TO THE JOINT PROGRAM AS SPEAKERS.

SECTION ON UROLOGY

MEETS IN ROOM 1, NAVY PIER

OFFICERS OF SECTION

Chairman—Reed M. Nesbit, Ann Arbor, Mich.

Vice Chairman—Earl E. Ewert, Boston.

Secretary—Edward N. Cook, Rochester, Minn.

Executive Committee—Arbor D. Munger, Lincoln, Neb ; Grayson Carroll, St. Louis; Reed M. Nesbit, Ann Arbor, Mich.

Wednesday, June 23—2 p.m.

Effect of Nephrectomy on Hypertension in Unilateral Renal Disease.
Eugene B. Vickery, New Orleans.

Lower Nephron Nephrosis (Lantern Demonstration).
Rex E. Van Duzen, Dallas, Texas.
Discussion to be opened by Clarence V. Hodges, Baltimore, and Harry Culver, Chicago.

The Treatment of Hypospadias (Lantern Demonstration).
Fred Z. Havens, Rochester, Minn., and Albert S. Black, Omaha.
Discussion to be opened by C.D. Creevy, Minneapolis, and David M. Davis, Philadelphia.

The End Results of Endovesical Treatment of Tumors of the Bladder.
John E. Dees, Durham, N.C.

The Preoperative and Postoperative Management of Patients Undergoing Ureteral Intestinal Anastomosis (Lantern Demonstration).
Rubin H. Flocks, Iowa City.

Urologic Complications Following Abdominal Perineal Resection.
Edward W. Campbell and G. J. Gislason, Philadelphia.

Vesical Calculus, with Report of a Gigantic Stone in the Female Bladder (Lantern Demonstration).
William N. Wishard Jr. and Myron Nourse, Indianapolis.
Discussion on papers of Drs. Campbell and Gislason and Drs. Wishard and Nourse to be opened by George H. Ewell, Madison, Wis., and Temple Ainsworth, Jackson, Miss.

Thursday, June 24—2 p.m.

Election of Officers

Chairman's Address (Lantern Demonstration).
Reed M. Nesbit, Ann Arbor, Mich.

Carcinoma Cells in Prostatic Secretion (Lantern Demonstration).
Donald D. Albers, John R. McDonald and Gershom J. Thompson, Rochester, Minn.
Discussion to be opened by Russell D. Herrold, Chicago.

Modified Technic in Suprapubic Prostatectomy (Lantern Demonstration).
O.A. Nelson, Seattle.

Retropubic Prostatectomy (Lantern and Motion Picture Demonstration).
Francis P. Twinem and Francis A. Beneventi, New York.

Status of Perineal Prostatectomy Today. (Lantern Demonstration).
Daniel R. Higbee, Denver.

An Evaluation of Transurethral Resection for Prostatic Hypertrophy (Lantern Demonstration).
John A. Taylor and Charles H. Place, New York.
Discussion to be opened by Henry Mortenson, Melbourne, Australia; Grayson Carroll, St. Louis; Vincent J. O'Conor, Chicago, and Nels F. Ockerblad, Kansas City, Mo.

Friday, June 25—2 p.m.

Muscle Transplant for Neurogenic Incontinence.
Earl E. Ewert, Boston.

Repair of Vesicovaginal Fistula. (Lantern Demonstration).
Roger W. Barnes and Ivan E. Martin, Los Angeles.

Vesicointestinal Fistulas (Lantern Demonstration).
John K. Ormond, John W. Best and Milton E. Klinger, Detroit.
Discussion on papers of Dr. Ewert, Drs. Barnes and Martin and Drs. Ormond, Best and Klinger to be opened by Hart M. Stang, Eau Claire, Wis.

Studies in Polycystic Renal Disease (Lantern Demonstration).
A. E. Goldstein, Baltimore.

Massive Retroperitoneal Tumors (Lantern Demonstration).
Robert W. Hunt, New York.

SECTION ON ORTHOPEDIC SURGERY

MEETS IN ROOM 3, NAVY PIER

OFFICERS OF SECTION

Chairman-J. Warren White, Greenville, S. C.

Vice Chairman-David M. Bosworth, New York.

Secretary-Joseph S. Barr, Boston.

Executive Committee-Theodore A. Willis, Cleveland; Francis M. McKeever, Los Angeles; J. Warren White, Greenville, S. C.

Wednesday, June 23-2 p. m.

Symposium on Foot Disabilities

F. D. Dickson, Kansas City, Mo., Chairman

Congenital Foot Variations: Their Influence in Clinical Disorders.
Dudley J. Morton, New York.
Discussion to be opened by R. I. Harris, Toronto, Canada.

Treatment of Congenital Deformities of the Feet in Infancy (Lantern Demonstration).
J. H. Kite, Atlanta, Ga.
Discussion to be opened by John L. McDonald, Toronto, Canada.

Treatment of Functional Disorders of the Foot in Childhood (Lantern Demonstration).
William T. Green, Boston.
Discussion to be opened by J. E. M. Thomson, Lincoln, Neb.

Conservative Treatment of Functional Disorders of the Foot in the Adolescent and Adult.
R. Plato Schwartz, Rochester, N. Y.
Discussion to be opened by Philip Lewin, Chicago.

Operative Treatment of Foot Imbalance in the Adolescent (Lantern Demonstration).
Halford Hallock, New York.
Discussion to be opened by J. Warren White, Greenville, S. C.

Operative Treatment of Deformities of the Feet in Adults (Lantern Demonstration).
Charles W. Peabody, Detroit.
Discussion to be opened by Earl D. McBride, Oklahoma City.

Thursday, June 24-2 p. m.

Election of Officers

Acromioclavicular Dislocation (Lantern Demonstration).
Boardman M. Bosworth, Bronxville, N. Y.

Arthroplasty of the Hip: Study of End Result (Lantern Demonstration).
Frank E. Stinchfield, New York.

Chairman's Address (Lantern Demonstration).
J. Warren White, Greenville, S. C.

Effect of Diathermy (Short Wave and Microwave) on Bone Growth in the Albino Rat (Lantern Demonstration).
Charles S. Wise, Washington, D. C., and Benjamin Castleman and Arthur L. Watkins, Boston.

Some Pathologic and Clinical Aspects of Low Back Pain.
Sten Friberg, Stockholm, Sweden.

Friday, June 25-2 p. m.

Intracapsular Fracture of the Neck of the Femur in Children (Lantern Demonstration).
Russell F. Sullivan, Brookline, Mass.

Comminuted Fractures of the Os Calcis: Choice of Treatment (Lantern Demonstration).
E. O. Geckeler, Philadelphia.

Architectural Principles in Arthrodesis.
H. A. Brittain, Norwich, England.

Radiocarpal Arthrodesis of the Wrist Using Iliac Bone Grafts (Lantern Demonstration).
I. S. McReynolds, Houston, Texas.

The Use of Capsulectomy and Arthroplasty for Limitation of Finger Motion (Lantern Demonstration).
Frederick L. Liebolt, New York.
Discussion to be opened by James P. Cole, Buffalo, and William G. Rhorer, Long Beach, Calif.

Study of End Result in Two Hundred Cases of Triple Arthrodesis of the Foot (Lantern Demonstration).
Edward J. Ferrarone and Garry deN. Hough Jr., Springfield, Mass.

SECTION ON GASTRO-ENTEROLOGY AND PROCTOLOGY

MEETS IN ROOM 5, NAVY PIER

OFFICERS OF SECTION

Chairman—Sara M. Jordan, Boston.

Vice Chairman—William H. Daniel, Los Angeles.

Secretary—Grant H. Laing, Chicago.

Executive Committee—J. A. Bargen, Rochester, Minn.; Martin S. Kleckner, Allentown, Pa.; Sara M. Jordan, Boston.

Wednesday, June 23—9 a.m.

Aren't We Still Missing Many Cases of Hiatus Hernia?
G. Gill Richards and Kenneth A. Crockett, Salt Lake City.

Incidence of Hiatus Hernia and Associated Lesions Diagnosed by Roentgen Ray.
Irving B. Brick, Washington, D.C.

Differential Diagnosis of Diaphragmatic Hernia and Coronary Artery Disease (Lantern Demonstration).
Arthur M. Master, Simon Dack, Arthur Grishman and Jacob M. Stone, New York.
Discussion on papers of Drs. Richards and Crockett; Dr. Brick, and Drs. Master, Dack, Grishman and Stone to be opened by Edward L. Jenkinson and Ralph C. Brown, Chicago.

Heartburn (Lantern Demonstration).
Henry J. Tumen and Edwin M. Cohn, Philadelphia.
Discussion to be opened by David J. Sandweiss, Detroit.

Studies on the Mechanism of Postgastrectomy Syndrome (Lantern Demonstration).
David Adlersberg and Ernst Hammerschlag, New York.
Discussion to be opened by Ralph Colp, New York, and Joseph B. Kirsner, Chicago.

The Diagnosis of Gastric Neoplasm by Cytologic Examination of Gastric Secretions.
Malcolm Block and Henry C. Bryant, Ann Arbor, Mich.
Discussion to be opened by Warren C. Hunter, Portland, Ore.

A Study of the Routine Use of Screening for the Detection of Liver Disease (Lantern Demonstration).
William D. Gambill, John E. Fisher, Bernard D. Rosenak and Rollin H. Moser, Indianapolis.
Discussion to be opened by Hugh R. Butt, Rochester, Minn.

Needle Biopsy of the Liver (Lantern Demonstration).
Leon Schiff, S. A. Safdi, R. C. Cogswell, G. W. Kumpe, D. F. Richkield and E. A. Gall, Cincinnati.
Discussion to be opened by Frederick W. Hoffbauer, Minneapolis, and Hans P. Popper, Chicago.

Thursday, June 24—9 a.m.

Business Meeting

Election of Officers

Chairman's Address: Correlation of Gastroenterology and Surgery.
Sara M. Jordan, Boston.

Possible Hazards of Diets High in Cholesterol in Coronary Disease (Lantern Demonstration).
Milton Plotz, Brooklyn.
Discussion to be opened by Louis N. Katz, Chicago.

The Surgical Treatment of Ulcerative Colitis (Lantern Demonstration).
Garnet W. Ault, Washington, D.C.
Discussion to be opened by Joseph Bank, Phoenix, Ariz.

Treatment of Idiopathic Ulcerative Colitis by Means of a Medical Ileostomy and Orally Administered Protein Hydrolysate Solution (Lantern Demonstration).
Thomas E. Machella, Philadelphia.
Discussion to be opened by T. Grier Miller, Philadelphia, and Sidney A. Portis, Chicago.

A Study of the Development of Anal Ducts and Glands, with Particular Reference to the Pathogenesis of Anorectal Disease. (Lantern Demonstration).
Malcolm R. Hill, Carroll S. Small and Lee Richards, Los Angeles.
Discussion to be opened by Henry W. Cave, New York.

Lymphomas of the Anorectum (Lantern Demonstration).
Emil Granet, M. B. Kagan and Cyril Solomon, New York.
Discussion to be opened by Walter A. Fansler, Minneapolis, and Claude C. Tucker, Wichita, Kan.

The Diagnosis of Intestinal Helminth Infections (Lantern Demonstration).
Elmer H. Loughlin, Brooklyn.
Discussion to be opened by Norman R. Stoll, Princeton, N. J., and Donovan C. Browne, New Orleans.

Polypoid Lesions of the Terminal Portion of the Colon with Special Relationship to Fulguration (Lantern Demonstration).
John R. Hill and Louis A. Buie, Rochester, Minn.
Discussion to be opened by Martin S. Kleckner, Allentown, Pa.

Friday, June 25—9 a.m.

JOINT MEETING WITH SECTION ON SURGERY, GENERAL AND ABDOMINAL, IN BALLROOM, SHERATON HOTEL

Newer Aspects of the Treatment of Ulcer (Lantern Demonstration). A. H. Aaron, Buffalo.

Vagotomy (Lantern Demonstration).
Keith S. Grimson, R. W. Rundles, George J. Baylin and H. M. Taylor, Durham, N. C.
Discussion on papers of Dr. Aaron and Drs. Grimson, Rundles, Baylin and Taylor to be opened by Lester R. Dragstedt, Chicago; Francis D. Moore, Boston; A. C. Ivy, Chicago; Waltman Walters, Rochester, Minn., and Walter L. Palmer, Chicago.

Nonspecific Inflammatory Lesions of the Terminal Ileum and Colon.
Russell S. Boles, Philadelphia.

Nonspecific Inflammatory Lesions of the Small and Large Bowel (Lantern Demonstration).
Leland S. McKittrick, Boston.
Discussion on papers of Drs. Boles and McKittrick to be opened by Clarence Dennis, Minneapolis; Burrill B. Crohn, New York; Lester R. Dragstedt, Chicago, and Everett D. Kiefer, Boston.

Diagnosis of Carcinoma of the Colon and Rectum (Lantern Demonstration).
Neil W. Swinton, Hugh F. Hare and William A. Meissner, Boston.
Discussion to be opened by Harry M. Weber, Rochester, Minn., and William H. Daniel, Los Angeles.

SECTION ON RADIOLOGY

MEETS IN BOULEVARD ROOM, SHERATON HOTEL

OFFICERS OF SECTION

Chairman—W. Walter Wasson, Denver.

Vice Chairman—Harry M. Weber, Rochester, Minn.

Secretary—U. V. Portmann, Cleveland.

Executive Committee—Edwin C. Ernst, St. Louis; Bernard P. Widmann, Philadelphia; W. Walter Wasson, Denver.

Wednesday, June 23—9 a.m.

Business Session

Chairman's Address: What Further Contributions Can Radiology Make to Medicine?
W. Walter Wasson, Denver.

Intervertebral Foramen Studies (Lantern Demonstration).
Lee A. Hadley, Syracuse, N. Y.
Discussion to be opened by L. Henry Garland, San Francisco, and Ralph K. Ghormley, Rochester, Minn.

A Basic Analysis of the Obstetric Pelvis by Roentgen Study (Lantern Demonstration).
William Snow, New York.
Discussion to be opened by J. P. Greenhill, Chicago, and Howard P. Doub, Detroit.

Angiocardiographic Visualization of the Pulmonary Artery in Health and Disease (Lantern Demonstration).
Charles T. Dotter and Israel Steinberg, New York.
Discussion to be opened by Harry M. Weber, Rochester, Minn., and Fred J. Hodges, Ann Arbor, Mich.

Lymphosarcoma: Its Diagnosis and Treatment.
Maurice Lenz, A. Purdy Stout, Orville L. Henderson and Josephine Sherman Wells, New York.
Discussion to be opened by Edward L. Jenkinson, Chicago, and Edwin C. Ernst, St. Louis.

Address.
Ellis Berven, Stockholm, Sweden.

Thursday, June 24—9 a.m.

Business Session

Election of Officers

Treatment of Stage I Carcinoma of the Cervix by Intracavitary Radium: Five, Ten and Fifteen Year End Results.
Juliette Baud, Paris, France.

Discussion to be opened by Harry H. Bowing, Rochester, Minn., and A. N. Arneson, St. Louis.

Some Factors Influencing the Response of Cancer of the Mouth and Throat to Radiation.
Constance A. P. Wood, London, England.

Discussion to be opened by A. Purdy Stout and Douglas Quick, New York.

Cancer of the Pharynx and Larynx.
Francois Baclesse, Paris, France.

Discussion to be opened by Juan A. del Regato, Columbia, Mo., and Maurice Lenz, New York.

Treatment and Results in Cancer of the Breast.
Stanford Cade, London, England.

Discussion to be opened by U. V. Portmann, Cleveland, and Robert J. Reeves, Durham, N. C.

The Present Position of Radiotherapy in Medical Practice.
B. W. Windeyer, London, England.

Discussion to be opened by Robert E. Newell, San Francisco, and Frederick W. O'Brien, Boston.

Friday, June 25—9 a.m.

JOINT MEETING WITH SECTION ON PREVENTIVE AND INDUSTRIAL MEDICINE AND PUBLIC HEALTH

Symposium on the Newer Aspects of Certain Occupational Dust Diseases

Beryllium

Chemical and Clinical Aspects (Lantern Demonstration).
Willard F. Machle, New York.

Pathologic Aspects (Lantern Demonstration).
Arthur J. Vorwald, Saranac, N.Y.

Radiologic Aspects.
Stanley A. Wilson, Salem, Mass.

Diatomite Pneumoconiosis: (Diatomaceous Earth)

Clinical Aspects.
Walter M. Anderson, Lompoc, Calif.

Pathologic Aspects.
William H. Carnes, Baltimore.

Radiologic Aspects (Lantern Demonstration).
Reginald H. Smart, Los Angeles.

Bauxite (Shaver's Disease)

Chemical and Physical Factors.
C. M. Jephcott, Niagara, Canada.

Pathologic Aspects.
A. R. Riddell, Toronto, Canada.

Clinical and Radiologic Aspects (Lantern Demonstration).
C. G. Shaver, Niagara, Canada.

PANEL DISCUSSION AND QUESTION AND ANSWER PERIOD AUDIENCE PARTICIPATION, WITH ARTHUR J. VORWALD, SARANAC, N.Y., AS MODERATOR AND THE CONTRIBUTORS TO THE JOINT PROGRAM AS SPEAKERS.

SECTION ON ANESTHESIOLOGY

MEETS IN BOULEVARD ROOM, SHERATON HOTEL

OFFICERS OF SECTION

Chairman—Ralph M. Tovell, Hartford, Conn.

Vice Chairman—Stuart C. Cullen, Iowa City.

Secretary—John S. Lundy, Rochester, Minn.

Executive Committee—Ansel M. Caine, New Orleans; Charles F. McCuskey, Los Angeles; Ralph M. Tovell, Hartford, Conn.

Wednesday, June 23-2 p.m.

Business Meeting for Presentation of Resolutions for House of Delegates

Preliminary Report of Committee on Operative Mortality (Lantern Demonstration).
Henry S. Ruth, Haverford, Pa., and Frederick P. T. Haugen, Portland, Ore., Co-Chairmen.

Chairman's Address: Anesthesiology in the Veterans Administration (Lantern Demonstration).
Ralph M. Tovell, Hartford, Conn.

The Relationship of the Anesthesiologist to the Hospital.
James R. Miller, Hartford, Conn.

Discussion to be opened by Charles F. McCuskey, Los Angeles, and H. Boyd Stewart, Tulsa, Okla.

The Functions of the American Board of Anesthesiology Past, Present and Future (Lantern Demonstration).
Paul M. Wood, New York.

Discussion to be opened by Ralph M. Waters, Madison, Wis., and Philip D. Woodbridge, Reading, Pa.

Brachial Plexus Block Anesthesia (Lantern Demonstration).
John J. Bonica, Tacoma, Wash.; Daniel C. Moore, Seattle, and Morton Orlov, Tacoma.

Discussion to be opened by James H. Crowley, St. Paul, and Robert L. Patterson, Pittsburgh.

Thursday, June 24-2 p.m.

Business Meeting

Election of Officers

An Acoustic Gas Analyser for Research in Anesthesiology (Lantern Demonstration).
Albert Faulconer Jr., Rochester, Minn.

Discussion to be opened by Charles D. Anderson and Mary Karp, Chicago.

A Clinical Appraisal of Methadon ("Amidone") and Its Isomers.
Jane E. Denton, Oliver H. Straus and Henry K. Beecher, Boston.

Discussion to be opened by Lieutenant Scott Whitehouse (MC), U.S.N.R., and Major Charles H. Mitchell, Medical Corps, United States Army.

Anesthetic Complications During and Following Chest Surgery (Lantern Demonstration).
K. K. Keown, Philadelphia.

Discussion to be opened by W. O. McQuiston, Peoria, Ill., and Ansel M. Caine, New Orleans.

The Effects of Various Methods of Premedication and Technics of Anesthesia as related to the Minute Volume Exchange (Lantern Demonstration).
Howard A. Bennett, Oklahoma City, and Stuart C. Cullen, Iowa City.

Discussion to be opened by Curtiss B. Hickcox, Philadelphia, and Paul H. Lorhan, Mission, Kan.

Caudal Sympathetic Block: A Comparison with Lumbar Sympathetic Block (Lantern Demonstration).
G. W. Curry, Cleveland.
Discussion to be opened by Ivan B. Taylor, Detroit, and Stuart C. Cullen, Iowa City.

Friday, June 25-2 p.m.

Laboratory Studies with Radioactive "Pentothal" (Lantern Demonstration).
J. L. Bollman, Rochester, Minn.
Discussion to be opened by Richard K. Richards, Chicago, and Edward B. Tuohy, Washington, D. C.

Quantitative Pharmacologic Studies with "Pentothal": A Preliminary Report (Lantern Demonstration).
E. A. Rovenstine and E. M. Papper, New York.
Discussion to be opened by J. Eugene Ruben, Philadelphia, and J. E. Remlinger, Evanston, Ill.

Observations on the Use of "Pentothal Sodium" in Presence of Hepatic Damage.
Bruce M. Anderson, Oakland, Calif.
Discussion to be opened by W. Allen Conroy and Huberta M. Livingstone, Chicago.

"Dibenamine" Protection Against Cyclopropane Arrhythmias: Clinical Study with Continuous Electrocardiographic Recordings.
L. S. Goodman, H. O. Brown, Mark Nickerson and Scott M. Smith, Salt Lake City.
Discussion to be opened by A. E. Rapoport, Chicago, and R. J. Whitacre, East Cleveland, Ohio.

SECTION ON GENERAL PRACTICE OF MEDICINE

MEETS IN ROOM 2, NAVY PIER

OFFICERS OF SECTION

Chairman—Eric A. Royston, Los Angeles.

Vice Chairman—Milton B. Casebolt, Kansas City, Mo.

Secretary—Winfred B. Harm, Detroit

Executive Committee—Wingate M. Johnson, Winston-Salem, N.C.; Paul A. Davis, Akron, Ohio; Eric A. Royston, Los Angeles.

Wednesday, June 23—2 p.m.

JOINT MEETING WITH THE SECTION ON PREVENTIVE AND INDUSTRIAL MEDICINE AND PUBLIC HEALTH

Diagnosis and Treatment of Occupational Metal Poisoning.
Leonard Greenburg, New York.

Lead:

The Differential Diagnosis of Lead Poisoning: Accepted Laboratory Criteria (Lantern Demonstration).
Elston L. Belknap, Milwaukee.

The Treatment of Lead Poisoning (Should One Attempt to "Store Lead" or to "Delead"?)
William C. Wilentz, Perth Amboy, N.J.

The Industrial Solvents:
Their Physiologic Effect (Lantern Demonstration).
John H. Foulger, Wilmington, Del.

Diagnosis and Treatment (Lantern Demonstration).
Rex H. Wilson, Akron, Ohio.

The Pneumoconioses: Which Industrial Dusts Are Inert? Which are Harmful? Why (Lantern Demonstration)?
L. E. Hamlin, Chicago.

Common Occupational Skin Diseases (Lantern Demonstration).
Nelson Paul Anderson, Los Angeles.

PANEL DISCUSSION AND QUESTION AND ANSWER PERIOD, AUDIENCE PARTICIPATION, WITH R. T. JOHNSTONE, LOS ANGELES, AS MODERATOR, AND THE CONTRIBUTORS TO THE JOINT PROGRAM AND OSCAR A. SANDER, MILWAUKEE, AS SPEAKERS.

Thursday, June 24—2 p. m.

Election of Officers

Chairman's Address: The Renaissance of the General Practitioner.
Eric A. Royston, Los Angeles.

Extraocular Malignant Melanoblastoma: A Clinical Study (Lantern Demonstration).
Marion S. Deweese, Ann Arbor, Mich.
Discussion to be opened by Udo J. Wile, Ann Arbor, Mich.

The Private Physician and Preventive Medicine (Lantern Demonstration). Bruce H. Douglas, Detroit.
Discussion to be opened by Paul A. Davis, Akron, Ohio.

The Diagnostic Significance of Failing Vision.
Lawrence T. Post, St. Louis.
Discussion to be opened by Paul O. Hageman, St. Louis.

The Nervous Factor in General Practice (Lantern Demonstration).
Frank N. Allan and Manuel Kaufman, Boston.
Discussion to be opened by John B. Dynes, Boston.

Friday, June 25-2 p. m.

The Do's and Don'ts of the Acute Abdomen.
Philip Thorek, Chicago.
Discussion to be opened by John Van Probaska, Chicago.

The Present Status of the Peptic Ulcer Problem (Lantern Demonstration).
S. Allen Wilkinson, Boston.

The Present Status of the Peptic Ulcer Problem.
S. Allen Wilkinson, Boston.
Discussion to be opened by Wingate M. Johnson, Winston-Salem, N. C.

Rheumatoid Spondylitis: Its Early Diagnostic Features and Management (Lantern Demonstration).
Richard Z. Query Jr., Charlotte, N. C.
Discussion to be opened by Edward F. Rosenberg, Chicago.

The Increase and Prolongation of Penicillin Plasma Concentration (Lantern Demonstration)
William P. Boger and Harrison F. Flippin, Philadelphia.
Discussion to be opened by Wallace E. Herrell, Rochester, Minn.

Diagnosis of Coarctation of the Aorta (Lantern Demonstration).
William L. Proudfit and A. Carlton Ernstene, Cleveland.
Discussion to be opened by O. T. Clagett, Rochester, Minn.

The Use and Misuse of Endocrine Therapy in Sterility (Lantem Demonstration).
Edward T. Tyler, Los Angeles.
Discussion to be opened by Willard O. Thompson, Chicago.

SECTION ON MISCELLANEOUS TOPICS

MEETS IN ROOM 2, NAVY PIER

Session on Allergy

OFFICERS OF SESSION

Chairman—Francis M. Rackemann, Boston.

Secretary—J. Harvey Black, Dallas, Texas.

Wednesday, June 23—9 a. m.

Chairman's Address.
Francis M. Rackemann, Boston.

Some Basic Facts and Problems of Clinical Allergy.
Frank A. Simon, Louisville, Ky.
Discussion to be opened by Jonathan Forman, Columbus, Ohio.

Climatotherapy in the Treatment of Allergic Diseases.
F. B. Schutzbank, Tucson, Ariz.
Discussion to be opened by L. O. Dutton, El Paso, Texas.

An Evaluation of Therapy in Infantile Eczema.
Lewis Webb Hill, Boston.
Discussion to be opened by A. V. Stoesser, Minneapolis.

Drug Allergy (Lantern Demonstration).
W. B. Sherman, New York.
Discussion to be opened by Marion B. Sulzberger, New York.

Immunologic and Morphologic Alterations in Hypersensitive States (Lantern Demonstration).
Gustave J. Dammin and Samuel C. Bukantz, St. Louis.
Discussion to be opened by Samuel M. Feinberg, Chicago.

Consideration of Water and Electrolyte Metabolism in Bronchial Asthma.
John M. Sheldon, Ann Arbor, Mich.
Discussion to be opened by John Warrick Thomas, Richmond, Va.

What Should the General Practitioner Do About Allergy?
Stearns S. Bullen, Rochester, N.Y.
Discussion to be opened by John H. Mitchell, Columbus, Ohio.

Diseases of the Chest

MEETS IN ROOM 2, NAVY PIER

OFFICERS OF SESSION

Chairman—Richard H. Overholt, Boston.

Secretary—J. Winthrop Peabody, Washington, D. C.

Thursday, June 24—9 a. m.

Laboratory Aspects of Streptomycin (Lantern Demonstration).
Emil Bogen, Los Angeles.

Streptomycin in Extrapulmonary Tuberculosis.
H. C. Hinshaw, Rochester, Minn.

Streptomycin in Treatment of Tuberculosis (Lantern Demonstration).
Karl Pfuetze, Cannon Falls, Minn.

Experience with Treatment of Various Forms of Tuberculosis with Streptomycin in Veterans Administration (Lantern Demonstration).
William Tucker, Minneapolis.

The Use of Streptomycin in Surgical Patients.
Edward J. Beattie, St. Louis.

Antibiotics in Relation to Nontuberculous Disease of the Chest.
Chester S. Keefer, Boston.

Session on History of Medicine

MEETS IN ROOM 2, NAVY PIER

OFFICERS OF SESSION

Chairman—Howard Dittrick, Cleveland.

Secretary—Josiah C. Trent, Durham, N. C.

Friday, June 25—9 a. m.

Rupture of the Invertebral Disk: A Short History of its Evolution as a Syndrome of Importance to the Surgeon (Lantern Demonstration).
William J. Mixter, Boston.

Continuous Suction Drainage in the Treatment of Intestinal Obstruction: A Historical Evaluation (Lantern Demonstration).
John R. Paine, Buffalo.

The Development of Intestinal Intubation as a Practical Clinical Procedure: Introduction of the Double Lumen Tube (Lantern Demonstration).
T. Grier Miller, Philadelphia.

Modern Historical Aspects of Peripheral Nerve Surgery (Lantern Demonstration).
Barnes Woodhall, Durham, N. C.

Recent Developments in Antithyroid Drugs.
E. B. Astwood, Boston.

The First Successful Pneumonectomy and its Historiical Significance. (Lantern Demonstration).
Rudolph Nissen, New York.

Session on Physical Medicine

MEETS IN ASSEMBLY ROOM, BUILDING OF THE AMERICAN MEDICAL ASSOCIATION

OFFICERS OF SESSION

Chairman—George Morris Piersol, Philadelphia.

Secretary—Frank H. Krusen, Rochester, Minn.

Thursday, June 24—9 a. m.

The Physical Treatment of the Hemiplegic Patient in General Practice (Lantern Demonstration).
Harold Dinken, Denver.

Therapeutic Possibilities of Microwaves ("Radar") (Lantern Demonstration).
Khalil G. Wakim, Julia F. Herrick, Gordon M. Martin, and Frank H. Krusen, Rochester, Minn.

Rehabilitation and General Practice.
Howard A. Rusk, New York.

Psychiatric Aspects of Physical Medicine.
Winfred Overholser, Washington, D. C.

Intermission

Panel Discussion on Physical Medicine in General Practice

George M. Piersol, Philadelphia, Moderator

Physical Treatment of Common Disorders of the Feet (Lantern Demonstration).
Frances Baker, San Francisco.

Physical Treatment of Backache (Lantern Demonstration).
Frederic J. Kottke, Minneapolis.

Physical Treatment of Peripheral Vascular Diseases.
Sedgwick Mead, St. Louis.

Physical Treatment of Shoulder Lesions (Lantern Demonstration).
Donald L. Rose, Kansas City, Kan.

THE SCIENTIFIC EXHIBIT

The Scientific Exhibit will be located on Navy Pier at the East end of the Convention Hall.

The seventeen sections of the Scientific Assembly have arranged groups of exhibits dealing with the various specialties of medicine, but these exhibits will be presented for the benefit of the physician in general practice rather than for the specialist. The Committee on Scientific Exhibit is sponsoring three special exhibits on fractures, physical medicine and fresh pathologic material; other subjects which will receive special attention are atomic energy, cancer and diabetes. Conferences on diabetes will be conducted in a room adjacent to the exhibit throughout the week. Motion pictures will be shown continously throughout the week in two theaters adjacent to the exhibit.

Admission to the Scientific Exhibit will be limited to persons wearing the Fellowship badge or other official badge of the Convention. The public will not be admitted to the Scientific Exhibit.

THOMAS G. HULL, Director,
Scientific Exhibit.

SPECIAL EXHIBITS

The Committee on Scientific Exhibit is sponsoring three special exhibits—fractures, fresh pathologic material and physical medicine.

Special Exhibit on Fractures

The Special Exhibit on Fractures is presented for the seventeenth time under the auspices of the following committee:

Kellogg Speed, Chicago, chairman.

Frederick A. Jostes, St. Louis.

Gordon M. Morrison, Boston.

The exhibit will be accompanied by continuous demonstrations throughout the week on the following subjects:

Compression Fracture of the Spine.

Fractures of the Ankle.

Fracture of the Carpal Navicular.

Fracture of the Lower End of the Radius.

Fracture of the Shaft of the Femur.

Supracondylar Fracture of the Humerus.

A pamphlet giving the essential features of the exhibit will be distributed.

The following orthopedic surgeons will assist the committee with the demonstrations:

Honald W. Adams, Boston.
Carroll Glenn Barber, Cleveland.
Richard J. Bennett Jr., Chicago.
Herbert L. Brumbaugh, Dayton, Ohio.
James J. Callahan, Chicago.
Kenneth Christoph, Brookline, Mass.
Carl B. Davis Jr., Chicago.
Arthur E. Diggs, Chicago.
Egbert H. Fell, Chicago.
Nicholas J. Giannestras, Cincinnati.
Harry B. Hall, Minneapolis.
E.A. Hamilton, Chicago.
Robert E. Ingersoll, Boston.
Burton C. Kilbourne, Chicago.
J. Whitfield Larrabee, Hartford, Conn.
John L. Lindquist, Chicago.
Robert T. McElvenny, Chicago
Robert R. McKnight, Tulsa, Okla.
John J. Milroy, Lake Forest, Ill.
Frank G. Murphy, Chicago.
Benjamin E. Obletz, Buffalo.

Manley A. Page, Chicago.
Charles N. Pease, Chicago.
Sheppard Hemington, Chicago.
John C. Richter Jr., Chicago.
Robert O. Ritter, Chicago.

Samuel L. Robbins, Cleveland.
Maurice B. Roche, St. Louis.
Carlo S. Scuderi, Chicago.
Harold A. Sofield, Chicago.
James K. Stack, Chicago.
Didley M. Stewart, Toledo, Ohio.
Russell F. Sullivan, Brookline, Mass.
James H. Tillotson, Lima, Ohio.
Samuel L. Turek, Chicago.
Vernon C. Turner, Evanston, Ill.
Theodore H. Vinke, Cincinnati.
Herbert W. Virgin Jr., Miami, Fla.
Kenneth H. Weston, Philadelphia.
Edgar White, Cincinnati.
Charles Francis Wood, Louisville.
Chester R. Zeiss, Chicago.

Special Exhibit on Fresh Pathologic Material

The Special Exhibit on Fresh Pathologic Material is presented with the cooperation of the Section on Pathology and Physiology under the auspices of the following committee:

I. Davidsohn, Mount Sinai Hospital, Chicago, chairman.

G.A. Bennett, University of Illinois College of Medicine, Chicago.

P.R. Cannon, University of Chicago School of Medicine, Chicago.

S.A. Levinson, University of Illinois College of Medicine, Chicago.

J.F. Sheehan, Loyola University School of Medicine, Chicago.

J.P. Simonds, Children's Memorial Hospital, Chicago.

W.B. Wartman, Northwestern University Medical School, Chicago.

An advisory committee has been appointed to assist the general committee, and includes the following members:

Alvin G. Foord, Pasadena, Calif.
George M. Hass, Chicago.
Edwin F. Hirsch, Chicago.
Frank W. Konzelmann, Atlantic City, N.J.
Harrison S. Martland, Newark, N.J.
J.J. Moore, Chicago.
Hans Popper, Chicago.
Otto Saphir, Chicago.

Demonstrations will be conducted from Monday morning to Friday noon from 10 a.m. to 1 p.m. and 1:30 to 4:30 p.m. Many of the hospitals in Chicago are cooperating, and fresh material of an interesting nature will be supplied daily. A large group of competent pathologists will aid in the program and conduct the demonstrations.

Special Exhibit on Physical Medicine

The Special Exhibit on Physical Medicine includes Physical Therapy, Occupational Therapy and Rehabilitation. It is presented for the third time under the auspices of the following committee:

Frank H. Krusen, Rochester, Minn., chairman.

Winfred Overholser, Washington, D. C.

Howard A. Rusk, New York.

J.F. HERRICK and E.J. BALDES, Mayo Foundation, Institute of Experimental Medicine, Rochester, Minn.:

Ultrasonics in Medicine: Devices for producing high frequency sound waves will be shown, and the possibilities for use of these waves in medicine will be indicated.

K.G. WAKIM and D.J. ERICKSON, Sections on Experimental Physiology and Physical Medicine, Mayo Clinic, Rochester, Minn.:

Electrical Stimulation of Muscles: The results of experimental studies on electrical stimulation of muscles will be demonstrated, and devices for this purpose will be shown.

O. LEONARD HUDDLESTON and JAMES G. GOLSETH, Department of Physical Medicine, University of Southern California School of Medicine, and Los Angeles County General Hospital, Los Angeles:

Clinical Electromyography: The exhibit will consist of electromyograms, charts, drawings and photographs dealing with various clinical observations in neuromuscular disorders using electromyography. There will also be demonstrations of the procedure on various types of neurologic patients.

H. WORLEY KENDELL, ELLA V. FAY and BEATRICE WADE, American Occupational Therapy Association and University of Illinois College of Medicine, Department of Physical Medicine, Chicago:

Occupational Therapy: There will be actual demonstrations on patients, varying the patients from day to day. Included will be cerebral palsy, paraplegia, poliomyelitis, general medical cases and arthritis.

HOWARD A. RUSK and DONALD A. COVALT, New York University School of Medicine, New York, and MILDRED ELSON and CATHERINE WORTHINGHAM, American Physical Therapy Association, New York:

Rehabilitation in Late Poliomyelitis: Methods and devices for the late rehabilitation of patients with poliomyelitis will be demonstrated with actual patients.

FRANCES A. HELLEBRANDT, Baruch Center on Physical Medicine, Medical College of Virginia, Richmond:

Hydrotherapy: Hydrotherapeutic procedures of use to the general practitioner will be demonstrated.

A. RAY DAWSON, LOUIS B. NEWMAN, ROBERT BOYLE, EDWARD E. AVERY and A.B.C. KNUDSON, Veterans Administration, Washington, D.C.:

Physical Medicine and Rehabilitation in Tuberculosis and Thoracic Surgery: The ultimate goal in the rehabilitation of patients with tuberculosis and other diseases of the chest is not only the physical recovery of these persons but their training for future economic independence. The exhibit will include charts, photographs, slides, motion pictures and apparatus showing the various rehabilitation activities. Patients will also be demonstrated.

HENRY H. KESSLER, New Jersey Rehabilitation Clinic, Newark, N.J.:

Rehabilitation of Amputees: This exhibit will present methods of rehabilitating persons who have major amputations of upper or lower extremities. Proper use of the prosthesis will be demonstrated by patients.

The following demonstrators will assist in the presentation of the exhibit:

Frances Baker, San Francisco.
Harold Dinken, Denver.
Arthur C. Jones, Portland, Ore.
W. Jerome Lee, Richmond, Va.
Sedgwick Mead, St. Louis.
C. O. Molander, Chicago.
W. D. Paul, Iowa City.
Donald L. Rose, Kansas City, Kan.
Herman L. Rudolph, Reading, Pa.
Walter M. Solomon, Cleveland.
Augustus Thorndike, Boston.
George D. Wilson, Asheville, N. C.
Walter J. Zeiter, Cleveland.

SECTION EXHIBITS

Each of the seventeen sections of the Scientific Assembly has arranged a group of exhibits dealing with the various branches of medicine.

Section on Internal Medicine

The representative to the Scientific Exhibit from the Section on Internal Medicine is Thomas C. Garrett, Philadelphia.

MARGARET CHIEFFI, LILLI HOFSTATTER, ESBEN KIRK and WILLIAM B. KOUNTZ, Washington University School of Medicine and St. Louis Infirmary Hospital, St. Louis:

Changes in Man Associated with Age: The exhibit presents a further evaluation from a physiologic and anatomic point of view of changes associated with age in man. Attempts at modification of certain functions are made by the administration of hormones.

GRAHAM ASHER, LAWRENCE STEFFEN and FRANKLIN D. MURPHY, University of Kansas School of Medicine, Kansas City, Kan.:

Subclinical Tetany, Its Recognition and Treatment: The exhibit describes studies on the incidence of low mineral diets in hypertension and angina; blood calcium studies in hypertension with and without evidence of subclinical tetany; subclinical tetany, definition, symptoms and signs; demonstration of a useful sign in myotactic irritability; influence of diet; electrocardiographic changes; associated deficiencies, and adjunctive treatment.

EMANUEL SCHWARTZ, LOUIS LEVIN, HARRY LEIBOWITZ, I. M. KURTZ, J. REICHER, J. F. KELLY and J. WOLF, Long Island College of Medicine and Long Island College Hospital, Brooklyn:

Histamine Antagonists: A comparative experimental and clinical study of "pyribenzamine," "benadryl," "antistin," "neohetramine," "thephorin" (Nu 1504), "histadyl" (01013) and "neoantergan" is presented. The effects of the antihistaminic drugs on histamine and allergic cutaneous wheals are illustrated, and cumulative data relating to their clinical value and limitations are presented.

PAUL N. UNGER, MURRAY WEINER and SHEPARD SHAPIRO, New York University College of Medicine, New York:

Vitamin K Tolerance Test: The prothrombin response to the parenteral administration of large doses of synthetic vitamin K is determined after resting levels have been established. Serial estimations of the diluted (12.5) plasma prothrombin time are made. In the presence of normal hepatic function the prothrombin time remains normal or becomes temporarily reduced to hyperprothrombinemia levels. When function of the liver is impaired, the existing hypoprothrombinemia fails of correction or, if the resting level is normal, it becomes temporarily prolonged. A total of 113 patients have been studied, the results of the test being correlated with other liver function tests and, in addition, biopsy studies in a significant number of the patients. The results demonstrate that the vitamin K tolerance test can be used as a sensitive and reliable indicator of over-all hepatic dysfunction.

STUART W. McLEOD, Rochester General Hospital, Rochester, N.Y.:

Pathologic Physiology of Barbiturate Poisoning: The exhibit demonstrates the types of observations that should be made during acute barbiturate intoxication. The important effect of barbiturates in toxic amounts in paralyzing the action of the ciliated epithelium of the bronchi is emphasized as well as the pulmonary complications which develop by virtue of this effect. The effect of anoxia secondary to the pulmonary complications in further depressing the central nervous system is presented. Methods of therapy based on the pathologic physiology of the disease are shown. The purpose of the exhibit is to consider barbiturate poisoning as a separate disease which, like any other disease, has an evolution.

DAVID CAYER, Bowman Gray School of Medicine, Winston-Salem, N.C.:

Vitamin Requirements in Health and Disease—Comparison of Clinical and Laboratory Data: The exhibit depicts levels of fat soluble, C and B complex vitamins in patients. Photographs and roentgenograms of patients, diagrams of vitamin metabolism, indications for use and suggested dosages are included. The diagnosis by signs, symptoms and vitamin levels in the blood plasma and urine are considered. Vitamin levels have been measured in patients maintained on restricted therapeutic diets, and with pernicious anemia, sprue, hepatic disease, acute and chronic infections and cancers. The effect of roentgen therapy on the vitamin excretion levels is also noted. The need for an adequate intake of each of the vitamins rather than excessive administration of any one group in an over-all plan of treatment of the individual patient is emphasized.

LOUIS KRASNO, University of Illinois College of Medicine, MARY KARP and PAUL S. RHOADS, Northwestern University Medical School, Chicago:

Inhalation of Penicillin Dust: A new method of administering penicillin involves the inhalation of the fine aerosol particles of dry pulverized penicillin. This method has simplified the mechanics of aerosol therapy, thus extending its scope more readily for office and home treatment. The original device and several modifications of the apparatus are presented. Bacteriologic findings of throat, nose and sputum cultures before and after inhalation therapy are demonstrated, and blood level determinations on a series of patients are illustrated. Clinical results are based on treatment of over 600 patients by this method.

CHARLES LEROY STEINBERG, Rochester General Hospital, Rochester, N.Y.:

Primary Fibrositis (Dupuytren's Contracture): The exhibit describes the pathology, symptomatology, biochemical blood changes and treatment with tocopherols of primary fibrositis. Primary fibrositis is overdiagnosed in Great Britain and on the Continent. It is underdiagnosed in the Western Hemisphere. Dupuytren's contracture is a form of primary fibrositis which is common but is not often diagnosed because it is not thought of in routine physical examinations. It may be the one objective evidence leading to a diagnosis of primary fibrositis.

MICHAEL A. RUBINSTEIN, Montefiore Hospital, New York:

Multiple Myeloma - Its Relation to Leukemia: The clinical, biochemical, pathologic and cytologic characteristics of multiple myeloma are described, and the criteria for differential diagnosis are discussed. Points of distinction between multiple myeloma and leukemia cannot be regarded as fundamental, and there is no sharp demarcation between the two diseases. Instances are abstracted in which cases of multiple myeloma manifest the various characteristics of leukemia and vice versa. Chemotherapy of multiple myeloma is reviewed.

W. PAUL HOLBROOK, DONALD F. HILL, CHARLES A.L. STEPHENS JR., LEO J. KENT and EDNA McCARTHY, Tucson, Ariz.:

Treatment of Rheumatoid Arthritis: Treatment of rheumatoid arthritis is presented with basic outline, optional, doubtful and worthless methods. Emphasis is given on prevention and correction of deformity with pictures, roentgenograms, charts and demonstrations. Special attention to knee contractions and correction with manipulation in approximately 70 cases is included.

CHARLES A.R. CONNOR, American Heart Association, New York:

Heart Disease: The exhibit gives general aims, purposes and programs of the American Heart Association.

H.M. MARVIN, American Council on Rheumatic Fever, American Heart Association, New York:

Rheumatic Fever: The exhibit of the American Council on Rheumatic Fever of the American Heart Association covers some phases of rheumatic fever and rheumatic heart disease.

ANTON S. YUSKIS and GEORGE C. GRIFFITH, University of Southern California School of Medicine and Los Angeles County General Hospital, Los Angeles:

Orthostatic Hypotension and Orthostatic Tachycardia, Observations in color of the vascular postural changes occurring in the retinal vessels in the syndrome of orthostatic hypotension and orthostatic tachycardia are shown. Normal postural vascular responses are also described. The effect of orthostatic hypotension on cardiac rhythm as shown in the electrocardiogram is demonstrated. The effect of treatment with "paredrine hydrobromide" is demonstrated, especially on the changes produced in the retinal vessels. These clinical observations are demonstrated as additional evidence that the possible cause for this syndrome is the abnormally low venous-capillary tone in the lower extremities.

ESTHER MEYER and MARVIN KAGEN, University of Illinois College of Medicine, Chicago:

Mycologic Diagnosis: The salient features of the symptoms and signs of the deep and superficial fungous diseases are listed, along with the specific drugs used in therapy. The methods of making mycologic diagnoses are illustrated and described. Sketches of the microscopic observation giant colonies, transparencies of the cutaneous lesions and anaerobic cultures are presented. The aim will be to give the general practitioner an approach to making a diagnosis of a fungous disease.

JOHN K. LATTIMER, J. BURNS AMBERSON, WILLIAM H. STEARNS, JOSEPH SCHWARTZ, ROWLAND GOODMAN and WILLIAM J. EAST, Kingsbridge Veterans Hospital, New York:

Streptomycin Therapy of Tuberculosis - Genitourinary System: Drawings, charts and photographs depict the pathogenesis of genitourinary tuberculosis and the methods and limitations of streptomycin therapy. Symptomatic results, bacteriologic methods and results, cystoscopic observations, toxicity and resistance to the drug are demonstrated.

ARTHUR LACK, TRAVIS WINSOR and WILLIAM ADOLPH, University of Southern California School of Medicine, Los Angeles, and Birmingham Veterans Administration Hospital, Van Nuys, Calif.:

Biomicroscopy of Conjunctival Vessels in Hypertension: Exhibit demonstrates a clinical method of direct visualization of bulbar conjunctival vessels with magnifications up to two hundred and forty times. Characteristics of normal vascular patterns and streamline flow are presented by charts and diagrams. Analysis of 100 hypertensive patients studied by this method reveals characteristic morphologic observations in the arterioles and capillaries. Most striking are the changes in the capillary bed, which suggest a hypertensive pattern characterized by (1) initial widespread narrowing or constriction throughout the capillary loops; (2) elongation with abnormal loopings; (3) progressive development of fixed tortuosities and sharp angularities; (4) loss of normal distensibility, and (5) thickening of capillary walls (confirmed by histologic study of necropsy material).

Section on Surgery, General and Abdominal

The representative to the Scientific Exhibit from the Section on Surgery, General and Abdominal, is Walter G. Maddock, Chicago.

WALTMAN WALTERS, with the assistance of HAROLD A. NEIBLING, and BRADLEY C. BROWNSON and SPENCER K. PHILLIPS, Mayo Clinic, Rochester, Minn.:

Vagotomy for Peptic Ulcer - Favorable and Unfavorable Results After a Two Year Experience: The exhibit presents a two year follow-up study of favorable and unfavorable results of vagotomy for peptic ulcer. The study includes (1) anatomic studies of vagi by means of photographs, gross specimens, drawings and models; (2) salient points in the surgical technic of transabdominal resection of the vagus nerve; (3) postoperative motility disturbances, as shown by preoperative and post-roentgenograms and balloon studies; (4) changes in gastric acidity, and (5) healing or recurrence of ulceration, following vagotomy or vagotomy combined with supplemental gastric surgical procedures. Abstracts of case histories show that there is a lack of positive correlation between relief of clinical symptoms in insulin-negative and insulin-positive patients; relief of gastrospasm and ulcer pain following vagotomy (which causes dilation of the stomach) is not to be interpreted as healing of ulcer; the abdominal approach in a case of suspected peptic ulcer may save the patient from being subjected to vagotomy in the absence of ulcer.

W. E. ADAMS and JAMES M. FRITZ, University of Chicago, Department of Surgery, Chicago:

Congenital Cystic Malformation of the Lung--Pathologic Characteristics and Differential Diagnosis: The exhibit of clinical and pathologic material of 17 representative patients (out of a total of 34 treated) emphasizes the problem of differential diagnosis in this lesion. The exhibit includes roentgenograms, photographs and photomicrographs in addition to tables.

RICHARD B. CATTELL and NEIL W. SWINTON, Lahey Clinic, Boston:

Pathogenesis of Carcinoma of Rectum and Colon: The incidence of polyps of colon and rectum, their importance in the pathogenesis of carcinoma and their relation to multiple cancers of the large intestine are shown. The methods of treatment--fulguration, colostomy and resection--are illustrated.

GROVER C. PENBERTHY, C. N. WELLER, R. J. NOER and J. L. POSCH, Wayne University College of Medicine, Children's Hospital of Michigan and Detroit Receiving Hospital, Detroit:

Treatment of Burns: The treatment of burned patients is described, including a presentation of physiologic disturbances produced by severe burns and means for restoring the patient's normal status. The treatment of the burned surfaces includes presentation of types of dressings and principles of early epithelial replacement.

JACOB J. WEINSTEIN, George Washington University School of Medicine, Washington, D.C.:

Parenteral Proteins in Surgery: The exhibit shows (1) the indications for parenteral proteins in both surgical and medical cases; (2) tolerance studies with parenteral protein hydrolysate by intravenous, subcutaneous and intramuscular routes; (3) the physiologic and histologic alterations associated with probable deficiencies; (4) postoperative blood deficiency in various surgical procedures with particular reference to the nitrogen loss and the effect on the blood proteins and hemoglobin; (5) clinical results, showing the effects of protein hydrolysate in various surgical procedures on patients who have received protein therapy and (6) toxicities, describing reactions for the entire study.

R. W. POSTLETHWAIT, H. LEE HOWARD and PAUL W. SCHANHER, Duke University School of Medicine, Durham, N.C.:

Nonreactive Absorbable Glove Powder: Transparencies illustrate the gross and microscopic lesions produced by talc implantation into various tissues in animals. Similar sections show little or no reaction when a starch powder is used. Appropriate case histories demonstrate the clinical importance of this reaction to talc and the necessity of obtaining a satisfactory substitute.

HERBERT CONWAY, CLARENCE R. STRAATSMA, CORNELIUS J. KRAISSL, ROBERT H. CLIFFORD, JEROME GELB, LEO L. LEVERIDGE, JULIUS M. JOSEPH, SAMUEL CLIMO and RICHARD B. STARK, Veterans Hospital, Bronx, N.Y.

Plastic and Reconstructive Surgery—Reconstruction of External Ear, Closed Abdominal Flaps and Crossed Leg Flaps: Moulages demonstrate the phases of reconstruction of congenital, traumatic and postoperative defects of the external ear. Photographs and moulages show the use of abdominal flaps, skin lined, to cover defects of the face and of the upper and lower extremities. Photographs and drawings present the use of pedicle flaps consisting of full thickness of skin and subcutaneous tissue from one leg to cover defects of the opposite extremity.

CLAIRE L. STRAITH, WILLIAM G. McEVITT, MATTHEW PILLING and JOHN R. LEWIS, Straith Clinic for Plastic Surgery, Detroit:

Automobile Injuries: New statistics are presented from a survey made by the Detroit Police Department, demonstrating the great hazards of riding in the " guest passenger " seat as compared with the driver's seat. Typical injuries received in various positions in the car are demonstrated. Principles of plastic repair useful to the physician, intern and general surgeon, who usually are called to treat these accidental injuries, are shown as well as some suggestions for subsequent repair of major defects for the rehabilitation of these accident victims. Suggestions are given for the improvement of automobile body design and protection of passengers from crushing facial injuries.

JAMES BARRETT BROWN, L. T. BYERS, FRANK McDOWELL and MINOT P. FRYER, St. Louis:

Congenital Deformities Repaired by Plastic Surgery: Congenital deformities of the face including cleft lips, defects and absence of the ears, ptosis of the eyelids and distortions of the nose and jaw account for a large number of patients who need surgical treatment and whose defects are amenable to surgical restoration. Illustrative photographs of these lesions along with records of what may be done to relieve the difficulties of these patients are presented.

LOUIS A. BUIE, N. D. SMITH, R. J. JACKMAN and J. R. HILL, Mayo Clinic, Rochester, Minn.:

Fulguration of Polypoid Lesions of the Terminal Portion of the Colon: The exhibit is based on a study of a large series of cases of polypoid disease of the colon. Especial attention is directed toward fulguration of polyps of the terminal portion of the colon. Moulages are employed to show various types of polyps and the frequency of their occurrence in different segments of the colon. Similarity of the situation of polyps and carcinoma in various areas of the large intestine is shown by diagrams. Lesions may be observed through proctoscopes which are in position in moulages of the anus and rectum. The observer may demonstrate for himself the performance of fulguration by utilizing electrical appliances which are provided.

L. B. WOOLNER and **JOHN R. McDONALD**, Mayo Clinic, Rochester, Minn.:

Cancer Cells in Sputum and Bronchial Secretions, an Aid in Diagnosis of Bronchogenic Carcinoma: The exhibit shows the clinical value of cytologic examination of sputum and bronchial secretions as an aid in the diagnosis of bronchogenic carcinoma. It includes *(a)* the technic of collection of material and the fixation and staining of smears, *(b)* the cytology of normal sputum, *(c)* the demonstration of cancer cells in sputum and bronchial secretions originating from the various histologic types of carcinoma of the lung, *(d)* case histories illustrating the diagnostic value of this method and *(e)* an analysis of the data on 150 consecutive cases in which the sputum or bronchial secretions were positive for carcinoma cells.

JERE W. LORD Jr., **LESTER BREIDENBACH**, **FREDERIC W. BANCROFT**, **THOMAS J. O'KANE** and **S. POTTER BARTLEY**, New York and Brooklyn Regional Committee on Fractures and Trauma of the American College of Surgeons, New York:

Management of Arterial Emergencies: The management of injuries to a major artery resulting from an accident outside of the hospital or an injury during the course of an operation is presented. Vascular equipment, first aid and emergency hospital treatment, definitive surgical procedure and postoperative care are outlined and illustrated. The surgical management of arterial emboli is discussed. Organization of vascular teams within each hospital is suggested to carry out these procedures.

GEORGIA PRICE and **ELIZABETH F. CARR**, Northwestern University Medical Library, Chicago:

Literature Illustrating the History of Surgery: This exhibit includes a collection of the outstanding books on surgery from the earliest printed works up to about the middle of the Nineteenth Century, and pictures of many outstanding men in the history of surgery.

ROY D. McCLURE, **L. S. FALLIS**, **A. B. McGRAW**, **C. R. LAM**, **B. E. BRUSH** and **D. E. SZILAGYI**, Henry Ford Hospital, Detroit:

Treatment of Acute Suppurative Appendicitis: Charts and graphs show comparative results in the treatment of this condition during the past 10 years. Details of diagnosis, preoperative care, surgical technic and postoperative care most important for obtaining good results are set forth in charts, diagrams and drawings.

JOHN D. STEWART, **SIDNEY M. SCHAER**, **W. H. POTTER** and **ALFRED J. MASSOVER**, University of Buffalo School of Medicine, Buffalo:

Management of Massively Bleeding Gastroduodenal Ulcer: Principles of management are tabulated, team work and preoperative resuscitation are described, and illustrative specimens and case histories are shown. Laboratory observations, including blood volume data, and their value in relation to therapy are analyzed. The operative technic is depicted, and the results in a series of cases are tabulated.

HILGER PERRY JENKINS, **HOWARD REISER**, **DAVID S. FOX** and **RUDOLPH JANDA**, University of Illinois College of Medicine and Woodlawn Hospital, Chicago:

Wounds of the Heart—New Experimental Method for Control of Hemorrhage: In an experimental study on animals the hemorrhage from wounds of the ventricles, the auricles and the coronary vessels was controlled by the application of a patch of gelatin sponge. Photographs demonstrate the method used with improvements in the technic of applying the sponge. The pathologic studies, gross and microscopic, demonstrate the healing of the wound and the ultimate absorption of the gelatin sponge. The clinical application of this experimental method, with its merits and limitations, is outlined.

THOMAS A. SHALLOW, **KENNETH E. FRY** and **FREDERICK B. WAGNER Jr.**, Jefferson Medical College Hospital, Philadelphia:

Parathyroid Adenoma—Clinical Problems: The key features in diagnosis and treatment of this disorder are reviewed. These are amply illustrated from personal cases which emphasize the problems in diagnosis, the various stages of the disease and the complications in the preoperative as well as the postoperative patient. The occurrence of this disease in both father and daughter is also portrayed.

J. ROSS VEAL, **HUGH H. HUSSEY** and **JOHN SHADID**, Georgetown University School of Medicine, Washington, D.C.:

Impaired Venous Circulation: The exhibit demonstrates the causes and effect of impaired venous circulation on the extremities. The early and late signs and symptoms of impaired venous circulation of the extremities are illustrated. The methods of diagnosis and differentiation are shown, together with the complications and treatment of the various phases of impaired venous circulation of the extremities.

GEORGE CRILE Jr. and **WILLIAM S. DEMPSEY**, Cleveland Clinic, Cleveland:

Indications for Removal of Nontoxic Adenomas of the Thyroid: The low incidence of carcinoma of the thyroid in necropsy material and vital statistics is compared with the high incidence of carcinoma found by the surgical pathologist. The difference in these figures results from the screening out of patients with innocuous adenomas who do not consult a surgeon. Indications for removal of selected nontoxic adenomas are given.

ROY G. KLEPSER, Georgetown University School of Medicine, Washington, D.C.:

Treatment of Abscess of the Lung: The exhibit presents the etiology and pathogenesis of pulmonary abscess, with results of chemotherapy, drainage and resection, based on an analysis of treatment of 200 consecutive pulmonary abscesses. Abscess of the lung in children is portrayed, and drawings illustrate the method of drainage. Indications for drainage and indications for resection of the lung are given.

BOWMAN C. CROWELL and **MALCOLM T. MacEACHERN**, American College of Surgeons, Chicago:

Cancer, Surgery, Fractures, Industrial Health and Hospital Rating: The exhibit depicts standards for cancer clinics, cancer detection centers, medical service in industry, graduate training in surgery and the point rating system for hospitals.

HAROLD LINCOLN THOMPSON and HARRY C. PROUT, Los Angeles:

Vagus Resection in the Treatment of Peptic Ulcer: The exhibit reviews the results in approximately 100 unselected cases in which vagus section was applied in the surgical treatment of peptic ulcer. The cases are collected from private and charity hospitals where operation was performed by resident and attending surgeons. It is believed that the cases illustrate average results being obtained at the present time from an operation as applied in general surgical practice.

ROBERT A. GROFF and JOSEPH C. YASKIN, Graduate School of Medicine, University of Pennsylvania, Philadelphia:

Technic of Pain Control: Neurosurgical methods of pain control and technic of rhizotomy, nerve section, chordotomy, sympathectomy and lobotomy for intractable pain due to neuralgias, causalgias and cancer are illustrated. Tic douloureux, glossopharyngeal neuralgia and peripheral vascular disease (Raynaud's disease, Buerger's disease) are considered.

HAROLD LAUFMAN, WAYNE B. MARTIN and STANLEY W. TUELL, Northwestern University Medical School, Chicago:

Vasospasm--An Experimental Study: The pattern of vasospasm subsequent to arterial and venous occlusions with particular emphasis on the importance of vasospasm in the recovery of strangulated intestine is demonstrated. Postocclusive vasospasm and the behavior of the blood stream in the smaller radicles under these conditions have a broad implication in the basic pathologic physiology of occlusive vascular disease in other parts of the body. Photographs of the apparatus and employment of the technics demonstrate the use of direct micrometry in measuring the caliber of the minute blood vessels. The effects of various therapeutic measures such as sympathetic nerve section and use of vasodilating drugs, oxygen and anticoagulants are shown by direct vision of microscopic blood vessels.

BERNARD JUDOVICH, WILLIAM BATES, GOLDA NOBEL and JAMES DUNN, University of Pennsylvania Graduate School of Medicine, Philadelphia:

Technic of Pain Control: Methods of pain control by local and regional injection are shown, with the technic of paravertebral nerve and sympathetic ganglion block. Pain syndromes include occipital neuralgia, scalenus anticus syndrome, postcoronary pain in shoulder, arm and hand, segmental neuralgias of chest and abdominal walls, painful scars, neuralgic phase of low back pain, sciatic pain and herpes zoster. Physical therapy for pain, use of the ammonium salts for nerve block and Coley's fluid for pain are illustrated.

ARNOLD S. JACKSON, Jackson Clinic, Madison, Wis.:

Hyperthyroidism--Diagnosis and Treatment: Use of Propylthiouracil, Iodine and Surgery: The exhibit demonstrates various aspects of hyperthyroidism--the diagnosis, the use of iodine and propylthiouracil therapy and the various steps in the surgical removal of goiter. Special attention is given to the use of propylthiouracil, and photographs and charts demonstrate the effect of this drug on cases of hyperthyroidism in children as well as adults. Indications for and against the use of the drug as determined by a study of 175 cases of toxic goiter are discussed.

Section on Obstetrics and Gynecology

The representative to the Scientific Exhibit from the Section on Obstetrics and Gynecology is Frederick H. Falls, Chicago.

WILLIAM BICKERS, Richmond, Va.:

Dysmenorrhea: Exhibit presents study of the endometrial pattern, basal temperature curve and myometrial contraction patterns, and intrauterine pressures in patients with dysmenorrhea. The intrauterine balloon technic for recording uterine contractions is presented. Treatment is discussed. Technic for recording the uterine contractions on the intact rabbit uterus will also be shown along with tracings to demonstrate the relation between animal and human uterine contraction patterns.

MONTE SALVIN, Los Angeles:

Uterotubal Insufflation-Use of Penicillin and Streptomycin Aerosols: The exhibit shows a model of the female pelvis containing cervix, uterus, tubes, ovaries and the openings from the fimbriated ends of the tubes into the peritoneal cavity together with an apparatus to vaporize penicillin and streptomycin and the introduction of the vapor by a cannula through the cervix, uterus and fallopian tubes to the peritoneal cavity. Charts show indications and results.

FREDERICK H. FALLS, University of Illinois College of Medicine, and CHARLOTTE S. HOLT, Illinois State Department of Public Health, Chicago:

Carcinoma of the Uterus: Charts, models, drawings and graphs depict carcinoma of the cervix and body of the uterus. Particular emphasis is placed on the pathology, gross and microscopic, and on the associated pathology. Etiologic factors are pointed out and diagnostic procedures for the detection of early carcinoma are described. Methods of treatment are shown together with statements concerning the results of such treatment.

J. W. CUTLER, University of Pennsylvania Graduate School of Medicine, Philadelphia:

Pregnancy and Tuberculosis-Changing Concepts in Management: The exhibit describes (1) management and results in pregnancy and arrested tuberculosis (arrested without callapse therapy); (2) management and results of pregnancy and tuberculosis (arrested without collapse therapy); (3) management and results of pregnancy and active tuberculosis first recognized during pregnancy, with case histories of patients in whom collapse therapy and streptomycin were used to bring the tuberculosis under control without interruption of pregnancy after other measures failed; (4) control of tuberculosis in pregnancy through routine use of antepartum roentgenologic examination of the chest.

CATHARINE MACFARLANE and FLORENCE SLATER, Woman's Medical College of Pennsylvania, Philadelphia:

Control of Cancer of the Uterus—Value of Periodic Pelvic Examination, Report of a Ten Year Clinical Research: Statistical charts illustrate the pelvic observations in a group of 700 presumably well women followed over a period of ten years. These include cancerous, precancerous and noncancerous lesions. Moulages illustrate cancerous and precancerous lesions as seen through vaginal speculums. Technic of the probe test and biopsy is demonstrated on specimens.

WALTER W. WILLIAMS and FRED A. SIMMONS, Springfield Hospital and Massachusetts General Hospital, Springfield and Boston:

Male Infertility: The exhibit interprets spermatic pathology in terms of clinical fertility. The material was derived from the routine study of sterility cases in private practice. A vast number of apparently normal gametes are ordinarily required to furnish a single normal spermatozoon which is capable of fertilizing an ovum. The damage to a sperm population is commonly out of all proportion to the observed anomalies. Potential fertility is a variable which roughly coincides with the incidence of spermatic pathology. The clinical problem of diagnosis and prognosis hinges on the ability to recognize significant damage to the sperm population as a whole. Sperm concentration and motility and incidence and type of pathologic gametes are all important.

WILLIS E. BROWN, OTTO F. KRAUSHAAR and J. T. BRADBURY, State University of Iowa College of Medicine, Iowa City:

Cytology in the Detection of Cancer-Results of a Survey in 5,000 Women over 30 Years of Age: The exhibit shows photomicrographs of normal and cancerous cells in smears stained by the Papanicolaou technic. In addition to adenocarcinomas and epidermoid carcinomas of the cervix and uterus, examples of cancers of lung and kidney are included. The summary of a survey of about 5,000 vaginal smears is presented to show the correlation of cytological observations with those of biopsies and clinical examinations.

JOHN W. HUFFMAN, Northwestern University Medical School, Chicago:

The Paraurethral Ducts: Wax model reconstructions, photomicrographs, photographs and drawings illustrate the embryology, the detailed anatomy, the histology and pathology of the paraurethral (Skenes) ducts and glands in the human female.

L. I. DUBLIN and D. B. ARMSTRONG, Metropolitan Life Insurance Company, New York:

Progress in Maternal and Infant Welfare: An exhibit of charts describes recent changes in birth rates, maternal mortality and infant mortality: (1) trend of the birth rate in the United States since 1920, by age of mother and birth order of child; (2) reductions in maternal mortality at various ages; regional variations, urban and rural compared; increase in hospital confinements; major puerperal causes, time of death in maternity; (3) decrease in infant mortality; chief causes of deaths in the first month of life; infant mortality of the states compared.

Section on Ophthalmology

The section exhibit committee of the Section on Ophthaomology consists of Georgiana D. Theobald, Oak Park, Ill., chairman; Edwin B. Dunphy, Boston, and Phillips Thygeson, San Jose, Calif.

WILLIAM STONE JR. Massachusetts Eye and Ear Infirmary, Boston:

New Type Movable Implant: The exhibit presents a new type of movable implant which is a modification of several existing varieties. The results of a large series of implantations done at the time of enucleation and also a series done on sockets where the previous result has been unsatisfactory will be presented. No extrusions have occurred over a year's period and the motility on an over-all basis is 84 per cent of that of the normal eye. The results of a series of plastic repairs on contracted sockets utilizing the implant are shown, and the advantages and disadvantages of the procedure are depicted. The surgical technic necessary is diagrammed in detail. Results of animal studies on tissue growth into and around these implants over varying periods are shown.

RAYMOND G. INGALLS, Institute of Ophthalmology, Presbyterian Hospital, New York:

Tumors of the Orbit: The exhibit illustrates the important characteristics of twenty-seven types of orbital tumors. Photographs show patients with exophthalmos, increased density of soft tissue, osseous changes, biopsy material and photomicrographs of the cellular structures. The tumors are presented in the order of their frequency: hemangioma, pseudo tumor, lymphosarcoma, dermoid cysts, retinoblastoma, meningioma, melanoma, neurofibroma, cholesteatoma, rhabdomyosarcoma, neuroblastoma, hematoma, myoblastoma, fibroma, osteoma, neurinoma, sarcoma, lipoma, dermolipoma and glioma. Carcinoma of the orbit is illustrated by several cases. The number of cases, percentages of frequency, age of onset, sex, orbit and an analysis of age factors, are presented.

BERTHA A. KLIEN, Chicago:

Diseases of the Fundus Oculi: Exhibit of paintings and photomicrographs illustrate the clinical and histopathologic manifestations of diseases of the retina, choroid and optic nerve. Special emphasis is placed on the correlation of the clinical and anatomic data and on the discussion of points important in the differential diagnosis of clinical syndromes, which are of interest not only to the ophthalmologist but to other specialties.

LOUIS LEHRFELD, Wills Eye Hospital, Philadelphia:

Prevention of Ophthalmia Neonatorum—Antibiotics Replace Silver Nitrate: The exhibit presents statistical data proving that use of silver nitrate is made obsolete by availability of new antibiotics. Every case of gonorrheal ophthalmia was cured with penicillin. Penicillin was instilled in place of silver. Silver is not a safe gonococcide in the eye. Treatment of infected expectant mother eliminates ophthalmia.

JOHN G. BELLOWS and CHESTER J. FARMER, Northwestern University Medical School, Chicago:

Treatment of Ocular Infections—Use of Chemotherapeutic Agents: Exhibit shows the distribution of sulfonamide compounds, penicillin and streptomycin between the blood and ocular fluids and tissues. A series of experimental extraocular and intraocular infections induced in rabbits' eyes by various organisms is shown by means of transparencies, together with clinical cases. The therapeutic agents employed in this study include the sulfonamide drugs, penicillin, streptomycin, gramicidin, tyrothricin and bacitracin. The sites of the commoner types of infection are shown diagrammatically, with the drug of choice. The procedure for obtaining corneal and conjunctival scrapings with the isolation and means of determining the sensitivity of the organism is shown. Methods of treatment including corneal baths, with and without ion transfer and intraocular injections, are illustrated.

LORAND V. JOHNSON, Western Reserve University School of Medicine, Cleveland:

Ocular Toxoplasmosis—Clinical Observations: The exhibit presents drawings of choroiditis, roentgenograms of cerebral calcification and data relating to danger to mother from additional pregnancies, but freedom from infection for additional babies. Congenitally infected babies do not appear later to transmit the infection to the third generation.

ADOLPH POSNER and ABRAHAM SCHLOSSMAN, New York:

Observations on the Course of Glaucoma: A statistical analysis is made of 474 cases of glaucoma, including 373 cases of primary glaucoma, with regard to age, sex and refractive errors of the patients. This material is compared with similar studies in the literature. Certain conclusions which have been drawn from this study are given in graphic form. Case histories are presented to compare mild glaucoma with malignant glaucoma. These two extremes in the scale of severity differ sufficiently from the typical picture to be worthy of special consideration.

Section on Laryngology, Otology and Rhinology

The representative to the Scientific Exhibit from the Section on Laryngology, Otology and Rhinology is James B. Costen, St. Louis.

J. BROWN FARRIOR, Tampa, Fla., and RICHARD C. BOYER, Ochsner Clinic, Tulane Medical School, New Orleans:

The Ear in Roentgen Anatomy: The exhibit consists of a series of temporal bones which have been sectioned and mounted in plastic to permit the visualization of the internal landmarks of the ear. Roentgenograms of the individual sections demonstrate the appearance of the anatomic divisions of the temporal bone as they appear on clinical roentgenograms. Sections are prepared for each of the classic roentgenologic views of the temporal bone.

CHEVALIER L. JACKSON, JOHN V. BLADY, CHARLES M. NORRIS and WALTER MALONEY, Temple University School of Medicine, Philadelphia:

Cancer of the Larynx: The exhibit presents an analysis of five year end results in a series of several hundred patients treated by surgery or irradiation, or both, from 1930 to 1942. Operative specimens and correlated clinical and pathologic data are so arranged that the criteria on which selection of treatment was based can be rechecked and reevaluated in the light of the subsequent course. A similar study of patients treated by irradiation alone and of patients in whom recurrence or metastasis was treated is also presented. A concise summary of the exhibitors' latest views on criteria for the selection of treatment are given.

JOSEPH I. KEMLER, Baltimore:

Bilateral Thyrotomy for Carcinoma of the Larynx: The exhibit shows drawing of carcinomas of the larynx suitable for the operation, photomicrographs of specimens and plates of the different steps of the operation, with models of some of them. A drawing of the larynx after operation is presented.

A. C. STUTSMAN, Washington University School of Medicine, St. Louis:

Foreign Bodies of the Tracheal Bronchial Tree and Esophagus: The exhibit of roentgenograms shows the various changes produced by nonopaque bodies in the tracheal bronchial tree. Foreign bodies of the upper portion of the esophagus are presented.

ADA M. HILL, American Hearing Society, Washington, D. C.:

Hearing Conservation: The exhibit consists of dioramas depicting progress in the work for persons with impaired hearing. Information is available on lip reading, hearing aids, prevention of deafness, and national and local programs for rehabilitation of the hard of hearing.

MILTON G. LEVINE, ROBERT E. HOYT and O. B. PRATT, College of Medical Evangelists, Los Angeles:

Rhinoscleroma—Etiology, Pathology and Diagnosis: The exhibit describes experimental studies carried out during the past two years in the Institute of Experimental Medicine. The etiology, pathology and diagnosis are presented.

GUERDAN HARDY, St. Louis:

Fractures of the Zygomatic (Malar) Bone—Diagnosis and Treatment: The exhibit includes charts showing causes of malar fractures, the diagnosis and associated injuries; photographs and roentgenograms of patients, and drawings showing proper approaches in both simple depression and comminuted fractures.

Section on Pediatrics

The representative to the Scientific Exhibit from the Section on Pediatrics is Albert V. Stoesser, Minneapolis.

CARLETON DEAN, Michigan Crippled Children Commission, Lansing, Mich.:

Prosthetic Training for Child Amputees in Michigan: The exhibit presents the physical and mental preparation and prosthetic instruction program developed by the Michigan Crippled Children Commission. Features include a prosthetic instructor who is a double arm amputee and several child amputees ranging in age from 5 to 14 years. Training in the use of the prosthesis for common, everyday activities will be exemplified by the use, on the part of the live models, of various equipment such as training steps, roller skates, tricycles, eating and writing equipment.

LAWRENCE J. LINCK, National Society for Crippled Children and Adults, Chicago:

Services to the Handicapped - Cerebral Palsy: The exhibit includes pictures and transparencies with descriptions illustrating health, welfare, education, recreation, rehabilitation and employment services for crippled and handicapped persons; special emphasis is placed on services for children with cerebral palsy, such as, physical, occupational and speech and hearing therapy.

H.M. KEITH, W.McK. CRAIG, J.W. KERNOHAN, F.P. MOERSCH and J.D. CAMP, Mayo Clinic, Rochester, Minn.:

Brain Tumors in Children: The exhibit presents a statistical analysis of brain tumors in children observed between the years 1907 to 1946 inclusive. In all the cases reported (over 400) the children had tumors which were proved by clinical means and by a microscopic examination of tissue removed at operation or at necropsy. These tumors are classified as to location and type, and as to the age of the patient. Case histories representing the various types of tumor observed, accompanied by roentgenograms and by gross and histologic photographs in color, are shown.

ALFRED D. BIGGS, St. Luke's Hospital, Chicago:

Primary Tuberculosis - A Clinical and Roentgen-Ray Study: The exhibit includes studies of the evolution and healing of typical primary lesions, as well as clinical features of primary tuberculosis including gastric washings and sedimentation rates;

ARILD E. HANSEN and HILDA F. WIESE, University of Texas School of Medicine, Galveston:

Dietary Fat in Relation to the Skin: One of the significant noncaloric functions of fat is its effectiveness in the maintenance of a healthy skin. Exclusion of fat containing linoleic or arachidonic acid from the diet results in typical syndromes characterized by abnormalities of the skin in both rats and young puppies. Analyses of the serum lipids and lipids of the skin show definite qualitative differences as compared with those of animals maintained on diets containing fats rich in the essential fatty acids. Possible relationship between dietary fat containing linoleic or arachidonic acid and the dermal structure of man has been demonstrated. The serum fatty acids of approximately three fourths of the infants and children and about one half of the adults with eczema show a low degree of unsaturation. Addition of fat of animal origin, such as fresh lard, and of certain vegetable oils rich in the essential fatty acids to the diet of some 200 patients disclosed favorable clinical response in the majority of infants and children.

HARRY WALLERSTEIN and ALFRED SCHWARZ, Jewish Memorial Hospital, New York:

Management of Erythroblastosis Fetalis - Substitution Transfusion; Indications and Technics: Enlargements of transparencies depict basic pathology believed responsible for failure of former methods of therapy. Charts show former routines and resultant mortality rates compared with present series. Criteria for anticipation and diagnosis and indications for blood substitution and other forms of treatment are given with significant case histories. Methods of blood substitution (including sagittal sinus, radial artery and umbilical vein technics) are described and illustrated by enlargements of transparencies and by manikin demonstration.

VIRGINIA SHULER, Committee on Rural Medical Service, American Medical Association, Chicago:

Rural Child Health: The exhibit shows the progress of the Hill-Burton program, revealing that of the hospital projects approved for construction a majority are located in communities with fewer than 5,000 population; programs fostered by state medical societies to extend the best of medical care to children who live in rural areas; how the health program of the Parent-Teachers Association coordinates with that of the medical societies, and how a medical school reaches out to the rural physician and offers him the advantages of urban practice.

JOHN P. HUBBARD, American Academy of Pediatrics, Chicago and Washington, D.C.:

Study of Child Health Services: Preliminary results of the two and one-half year nationwide study of child health services are described. The amount of child care by hospitals, community health agencies and physicians; the distribution of these services in relation to child population and according to the metropolitan and isolated character of the counties; variations between states, and comparisons between the services for children provided by general practitioners and pediatricians are shown. The extent of the general practitioners' and the pediatricians' hospital training in pediatrics is given special emphasis. Charts based on visits and questionnaires to medical schools, with particular reference to pediatric education, include comparisons in budgets and variations in teaching hours. A diagram shows the implementation program at the national level and its integration with state programs.

Section on Experimental Medicine and Therapeutics.

The representative to the Scientific Exhibit from the Section on Experimental Medicine and Therapeutics is Robert W. Wilkins, Boston.

IRVING S. WRIGHT, CHARLES D. MARPLE and DOROTHY F. BECK, Committee for the Evaluation of Anticoagulants in the Treatment of Coronary Occlusion with Myocardial Infarction, American Heart Association, New York:

Anticoagulants in the Treatment of Coronary Occlusion with Myocardial Infarction: The exhibit presents the experience of the Committee in over 800 cases of coronary occlusion, approximately one half treated with anticoagulants. It includes the plan under which the study was accomplished; the mortality and morbidity among patients treated with anticoagulants as compared with patients treated by conventional methods alone; the incidence of hemorrhagic complications of anticoagulant therapy with the causes for and treatment of such complications; the usual incidence of thromboembolic complications of cardiovascular disease and the effect of anticoagulant therapy on this incidence and technics in the use of "dicumarol" and heparin.

SAMUEL M. FEINBERG, THEODORE B. BERNSTEIN, JACK M. ROSE, ALAN R. FEINBERG and SIDNEY FRIEDLAENDER, Northwestern University Medical School, Chicago:

Antihistaminic Drugs: The exhibit depicts the role of the antihistaminic drugs and shows the various mechanisms by which histamine may be combated and the mechanism of the antihistaminic drugs. The experimental actions of these drugs are illustrated, and the clinical indications, uses, incidence of results, toxic actions and limitations are described. Colored drawings of series of skin tests on backs of human subjects illustrate a new technic for assay of these drugs. Placards show the structural formulas and chemical names of new and old drugs tried by the authors experimentally and clinically.

SAMUEL J. PRIGAL, New York Medical College, Flower and Fifth Avenue Hospitals, New York:

Studies with Steam-Generated Aerosols: The exhibit describes the apparatus, a combined steam-generator and aerosolizer which is capable of producing aerosols of a variety of solutions such as aminophylline, ammonium chloride, epinephrine, "benadryl," penicillin, streptomycin and sulfonamide drugs. Several methods of confining and conserving the aerosol by means of a tent, breathing box and a closed chamber are shown. Blood levels of penicillin and streptomycin obtained by inhalation of aerosols are recorded. The clinical evaluation of the use of aminophylline aerosol in the treatment of asthma and aerosol penicillin in the treatment of infections in the respiratory tract is presented. The prophylactic application of aerosol penicillin in respiratory diseases is emphasized.

DAVID LEHR, New York Medical College, Flower and Fifth Avenue Hospitals, New York:

Low Toxicity of Sulfonamide Combinations-Experimental and Clinical Studies: Several sulfonamide drugs, such as sulfathiazole, sulfadiazine, sulfamerazine and sulfamezathine, can be dissolved simultaneously in the same medium to the full extent of their separate saturation levels without the occurrence of precipitation. Consequently, combinations of partial dosages of two or more sulfonamide compounds, if compared with equal total amounts of single drugs, showed substantially less tendency to intratubular deposition of crystals and thus to the development of renal obstruction. This fact accounted for the strikingly low acute and chronic toxicity of sulfonamide combinations in experimental animals. In addition, combinations were more completely absorbed and excreted than any of their individual constituents at the same total dosage. These results were confirmed in absorption-excretion studies in human beings using combinations of equal partial amounts of sulfadiazine-sulfathiazole-sulfamerazine, sulfadiazine-sulfathiazole, and sulfadiazine-sulfamerazine. Therapeutic results were uniformly satisfactory and conspicuous in many instances by the speed of clinical improvement.

SIBLEY W. HOOBLER and GORDON K. MOE, University of Michigan Medical School, Ann Arbor, and RICHARD H. LYONS, Syracuse University Medical School, Syracuse, N.Y.:

Autonomic Blockade with Tetraethylammonium - Pharmacologic Studies with Specific References to its Diagnostic and Therapeutic Use in Peripheral Vascular Diseases: Tetraethylammonium compounds temporarily block transmission of nerve impulses at the autonomic ganglions. The drug is therefore indicated as a diagnostic or therapeutic agent where sympathectomy may be of benefit. Skin temperature and plethysmographic records showing alterations in peripheral blood flow following administration of the drug to normal subjects and to patients with various peripheral vascular disease states are presented and compared to the effects of alterations of vasomotor tone by means of such procedures as reflex vasodilatation from body heating, paravertebral sympathetic block and sympathectomy. Pharmacologic studies of the drug in animals and its effects on the human gastrointestinal tract in hypertension and in other conditions are illustrated.

ALVAN L. BARACH, GEORGE FOSTER HERBEN, JAMES H. CULLEN and CHESMORE EASTLAKE JR., Columbia-Presbyterian Medical Center, New York and The House of Rest, Yonkers, N.Y.:

Bilateral Lung Rest in the Treatment of Pulmonary Tuberculosis-Principles and Technic of the Use of the Immobilizing Lung Chamber: The exhibit explains the principle of bilateral lung rest and illustrates how equal pressures are maintained on the outer and inner surfaces of the chest wall. The passage of air in and out of the immobilized lungs is shown to be the result of a variation in the density of air in the chamber produced twenty-five times a minute. The clinical results in 20 patients are reported, illustrated by roentgenograms of the lungs before and after treatment and follow-up films for one to ten years. Data on 15 of 21 patients who obtained arrest of their disease with closure of cavity and negative sputums are presented. The method of operation of the chamber is described.

A. J. CARLSON and A. C. IVY, National Society for Medical Research, Chicago:

Animal Experimentation and Medical Progress: The exhibit consists of material illustrating antivivisection propaganda and literature and other educational aids provided by the National Society for Medical Research suitable for educating the public on the necessity, benefits and humane character of animal experimentation.

WILLIAM P. CHAPMAN, ROBERT B. LIVINGSTON, MILTON GREENBLATT and HARRY C. SOLOMON, Boston Psychopathic Hospital, Harvard Medical School, Boston:

Physiologic Studies of Frontal Lobe in Man: (1) Effects of Electrical Stimulation of Orbital Surface; (2) Effects of Lobotomy: Cessation of respiration and elevation of blood pressure were obtained independently or simultaneously by electrical stimulation of the orbital surface of the frontal lobe in 7 of 9 patients. Results of stimulating the tip of both temporal lobes are also shown. A decreased tolerance to discomfort was obtained after lobotomy. Postoperative changes in the electroencephalogram, epinephrine response and in dextrose tolerance curves are shown.

J. Q. GRIFFITH JR., University of Pennsylvania, and J. F. COUCH, U. S. Department of Agriculture, Philadelphia:

Pharmacology and Clinical Use of Rutin: Many investigators have contributed to this exhibit, which has been arranged by Griffith and Couch. The exhibit describes (1) animal experimental studies showing the effect of rutin on capillary permeability and fragility under various experimental conditions; (2) the effect of rutin in the following clinical conditions: (*a*) patients with hypertension and associated capillary fault, to lessen incidence of apoplexy, (*b*) retinal hemorrhage, (*c*) purpura, (*d*) hereditary telangiectasia, (*e*) idiopathic hemoptysis, (*f*) certain cases of nephrosis, (*g*) as an adjuvant to physostigmine in treatment of glaucoma and (*h*) prophylaxis against radiation injury.

ALBERT E. SIDWELL JR. and WALTER WOLMAN, Chemical Laboratory, American Medical Association, and EARL C. PFEIFFER, University of Illinois College of Medicine, Chicago:

Chemical Structure and Pharmacologic Action: The exhibit shows the effect of substitution of chemical groups in pharmacologically active substances. The relation of the spatial differences between atomic groupings and the pharmacologic activities of the compounds are indicated. Models and drawings emphasize the distance between groups and the effect of substituents on the potency of drugs.

Section on Pathology and Physiology

The representative to the Scientific Exhibit from the Section on Pathology and Physiology is Frank W. Konzelmann, Atlantic City, N. J.

KARL A. MEYER, DONALD D. KOZOLL, WILLIAM S. HOFFMAN, FREDERICK STEIGMANN and HANS POPPER, Hektoen Institute for Medical Research of Cook County Hospital, Chicago:

Amino Acids in Clinical Medicine: The value of specially processed proteins and amino acid preparations in the treatment of conditions accompanied by protein deficiencies is demonstrated by the results obtained from both clinical observations and laboratory studies. The role of specific amino acids in enhancing the biologic value of natural protein and in combating deficiencies is explained. The etiologic and pathogenetic mechanism of protein deficiency in various surgical and medical diseases is discussed, as are the therapeutic indications of amino acids. The exhibit describes methods for the biologic evaluation of protein preparations in animal and human subjects and deals with the principles involved in the practical application of amino acid therapy.

MELVIN H. KNISELY, EDWARD H. BLOCH, THEODORE S. ELIOT and LOUISE WARNER, University of Tennessee College of Medicine, Memphis, and University of Chicago School of Medicine, Chicago, and FRITZ GORO, *Life Magazine*, New York:

Sludged Blood: A series of colored 8 by 10 inch (20 by 25 cm.) transparencies of microscopic living circulation show some aspects of normal circulation and various kinds of circulatory damage done by sludged blood.

L. W. KINSELL, G. D. MICHAELS, SHELDON MARGEN, H. A. HARPER, W. E. LARSEN, D. P. McCALLIE and E. F. EVANS, University of California Medical School, San Francisco and U. S. Naval Hospital, Oakland, Calif.:

Protein Metabolism in Disease of the Liver: The liver is essential for normal anabolism and catabolism of dietary and endogenous protein. Data are presented to illustrate (1) that lipotropic agents improve the utilization of administered protein in patients with chronic hepatic damage, (2) that the utilization of intravenously administered methionine is impaired in patients with acute and chronic damage to the liver, (3) that there is evidence of an excessive catabolism of sulfur-containing amino acids in some persons with severe hepatic damage and (4) that this excessive catabolism can be corrected by the administration of certain protein anabolic steroids. From the preceding and related observations, one is enabled to arrive at certain conclusions and impressions concerning the mechanism and treatment of patients with chronic hepatic damage. The work here presented has been performed under a contract with the Office of Naval Research.

BERNARD M. CHAPMAN and ISADORE PILOT, Edgewater Hospital, Chicago:

Cancer Diagnosis in Small Community Hospital: The exhibit shows the simple scientific methods in cancer diagnosis available in the general practitioner's office that can be coordinated with the facilities of a small community hospital. The technic of preparing slides of exfoliate cells from various body secretions for Papanicolaou smear diagnosis is described. The method, advantages and limitations of aspiration biopsy and the correct procedures of formal biopsy are illustrated. Case histories using these diagnostic procedures are shown with transparencies to illustrate the pathologic conditions.

JULIUS S. WEINGART, Iowa Lutheran Hospital, Des Moines, Iowa:

Stereoscopic Photography of Pathologic Specimens: The exhibit shows stereoscopic photographs, most of them in color, illustrating many phases of morbid anatomy. This is offered as an extremely effective method for preserving the actual appearance of specimens with all their anatomic relations. The apparatus and technic involved will be demonstrated.

LALL G. MONTGOMERY, American Society of Clinical Pathologists, Muncie, Ind.:

Registry of Medical Technologists: The exhibit describes the work of the Registry of Medical Technologists, its objects and aims, requirements for certification and growth of the registry; charts show the distribution of registrants, both geographic and as to places of employment, and illustrate salary studies of registrants' records.

J. GARROTT ALLEN, MARGARET SANDERSON, WILLADENE EGNER, CHARLES McKEEN, RICHARD ELGHAMMER, JAMES CROSBIE and BURT GROSSMAN, University of Chicago, School of Medicine, and Argonne National Laboratory, Chicago:

Hemorrhagic Disease Caused by Heparinemia—Temporary Control by Toluidine Blue or Protamine Sulfate: The exhibit shows control of certain hemorrhagic diseases by toluidine blue or protamine sulfate. Such diseases are caused in part at least by a circulating anticoagulant similar to heparin. These include the hemorrhagic syndrome following ionizing irradiation and nitrogen mustard therapy; that associated with acute and subacute leukemic states, experimental anaphylactic shock and to some extent in Werlhoff's disease, aplastic and pernicious anemias. Temporary control of bleeding in most of these states may be obtained by the intravenous administration of toluidine blue or protamine sulfate. Both of these are antiheparin substances. They do not affect the hemorrhagic states caused by reduced prothrombin activity, hemophilia or afibrinogenemia.

CARROLL L. BIRCH, LOUIS R. LIMARZI, RAYMOND S. KIBLER, J.T. PAUL, R.M. JONES AND P.L. BEDINGER, University of Illinois College of Medicine, Chicago:

Multiple Myeloma: History, symptoms and treatment of multiple myeloma are shown, with transparencies of myeloma cells in blood and bone marrow. Theories of origin of myeloma cells are illustrated. Roentgenograms show changes in bone. Specially stained cells demonstrate the chemistry of the disease.

JOHN A. WAGNER and GEORGE W. SMITH, University of Maryland School of Medicine, Baltimore:

Pathology of Intracranial Hemorrhage: A series of mounted gross specimens is presented, covering many of the disease processes accompanied by intracranial hemorrhage. These are divided into their principal groups (traumatic, vascular, metabolic, circulatory and neoplastic), each group of specimens being accompanied by charts, graphs and clinical abstracts for purposes of correlation. Working models of a type comparable to a skull and its contents are used to illustrate the dynamics of subdural and epidural hemorrhages. A section is devoted to the bedside diagnosis of minimal subarachnoid hemorrhage.

Section on Dermatology and Syphilology

The representative to the Scientific Exhibit from the Section on Dermatology and Syphilology is Francis W. Lynch, St. Paul.

REUBEN L. KAHN, BETTY J. BARIBEAU and FELIX A. REISS, University of Michigan Hospital, Ann Arbor:

Universal Serologic Reactions with Lipid Antigen: Several universal serologic reactions are shown: (1) results of a special serologic technic (different from diagnostic reactions in syphilis based on restricted technic); (2) reactions shown by all normal human beings tested, with different serologic patterns within a given range; (3) reactions shown by all animals tested, with different serologic patterns in different species; (4) reactions distinctive in syphilis and in lepromatous leprosy; (5) reactions under investigation (with technical variations) in other diseases.

ANNE L. BOHNING, HENRY EISENBERG, BELLE KORMAN, LYDIA MARSHAK, HERMAN N. BUNDESEN and THEODORE J. BAUER, Municipal Social Hygiene Clinic, Chicago Health Department, Chicago:

Studies in Cardiac Syphilis - Case Reports with Electrocardiographic, Roentgenographic and Clinical Observations: Electrocardiograms, roentgenograms and clinical observations are shown in cases of uncomplicated syphilitic aortitis, various types of aneurysms, involvement of the aortic valve, syphilitic heart disease associated with other types of heart disease and cases of cardiac syphilis in which there has been intensive treatment for syphilis with electrocardiographic, roentgenographic and clinical studies before treatment and one year or more after treatment. Statistics obtained from studies on 783 cases of proved syphilis show distribution of types of syphilitic heart disease according to age and sex, types of electrocardiographic tracings in 373 cases of syphilitic heart disease and percentages of cases in which syphilitic heart disease is associated with other types of heart disease.

J.R. HELLER Jr., Venereal Disease Division, U.S. Public Health Service, Washington, D.C.:

Treatment of Early Syphilis, Prenatal Syphilis and Neurosyphilis: Current penicillin therapy schedules, including outpatient treatment, are illustrated, with guides showing types of serologic response after the treatment of early syphilis with penicillin and their probable clinical implications. The panel on neurosyphilis shows the response of the spinal fluid after penicillin therapy and compares this with the response after malaria or hypertherm treatment. Reprints and booklets of interest to physicians are available.

HELEN OLLENDORFF CURTH, Columbia University College of Physicians and Surgeons, New York:

Cancer and Acanthosis Nigricans: Acanthosis nigricans, a benign cutaneous disease, is associated with an internal cancer in 50 per cent of cases. So-called malignant and benign acanthosis nigricans are clinically and histologically identical. Cancer associated with acanthosis nigricans is highly malignant. In malignant acanthosis nigricans some properties of the tumor may activate the cutaneous lesions, while in benign acanthosis nigricans one of the sex hormones may do the same. Acanthosis nigricans associated with cancer has also been observed in dogs. The relationship between acanthosis nigricans and cancer is close and definite. It may be genetic.

J. WALTER WILSON, University of Southern California, and ORDA A. PLUNKETT, University of California at Los Angeles, Los Angeles:

Practical Medical Mycology - Culture and Identification of Fungi as an Office Procedure: Medical mycology has attained but a small fraction of that degree of popularity which is necessary for diagnostic accuracy. One of the principal reasons is that the laboratory methods which are employed remain so antiquated, cumbersome, time-consuming, laborious, dirty and malodorous as to cause the entire process to be considered an unpleasant chore by the majority of physicians. This exhibit demonstrates several innovations by which most of these objectionable features may be eliminated. Preserved culture specimens of one hundred and thirty species of fungi representing the eighty-five genera which are believed to be of interest to practitioners of medicine are presented, including all important pathogenic fungi and those contaminants commonly encountered. Mounted immediately above each specimen is an illustration of the microscopic features which serve to identify the species or genus. Space is provided for two hundred growing specimens in process of diagnosis. Two hundred permanently preserved mounts for microscopic study of all pertinent fungi are included, as well as histopathologic preparations of mycologic value. Forty-two color transparencies serve to illustrate the simplified laboratory technics. One hundred and twelve transparencies of line drawings serve to show simplified methods of identification.

CARL T. NELSON, Columbia University College of Physicians and Surgeons, New York:

The Kveim Reaction in Sarcoidosis: The exhibit shows the method of preparation of the Kveim antigen and describes the gross and histologic appearance of the so-called Kveim reaction in cases of sarcoidosis. Data are given on the specificity, sensitivity and clinical value of the reaction in this disease.

MAURICE T. FLIEGELMAN and CHARLES F. WILKINSON Jr., University of Michigan, Ann Arbor; EUGENE A. HAND, Saginaw, Mich., and STURE A. M. JOHNSON, University of Wisconsin, Madison:

Mendelian Dominant Skin Diseases - the Inheritance of Xanthoma Tuberosum Multiplex; the Inheritance of the Ehler-Danlos Syndrome: The mendelian, non-sex-linked mode of inheritance as well as the clinical characteristics are illustrated for two well known skin disease entities as represented by two large families, one with the Ehler-Danlos syndrome, the other with xanthoma tuberosum multiplex. Analysis of the genetic pattern makes it possible to predict the matings which will produce these conditions in the offspring.

WALTER C. LOBITZ Jr., Hitchcock Clinic; Dartmouth Medical School, Hanover, N.H.:

The Chemistry of Palmar Sweat: Sweat collected from a palmar sweat gland was studied in an attempt to obtain more information concerning the normal function of the individual sweat gland. The exhibit demonstrates how and why the sweat was collected from the openings of palmar sweat ducts and analyzed. The studies were carried out on normal persons when the blood concentrations of some of the substances were elevated. The values are presented for the chloride, urea, dextrose, uric acid, ammonia nitrogen and creatinine concentrations of palmar sweat.

GEORGE E. SNIDER and PHILIP H. LANDERS, Veterans Administration Hospital, Fort Howard, Md.:

Nitrogen Mustard in the Treatment of Boeck's Sarcoid: The exhibit is composed of chest roentgenograms, photographs, photomicrographs and charts showing the clinical progress of patients with Boeck's sarcoid treated with nitrogen mustard.

FREDERIC E. MOHS, University of Wisconsin Medical School, Madison.:

Chemosurgical Treatment of Cancer of the Skin - A Microscopically Controlled Method of Excision: The chemosurgical technic by which the microscopic control of excision is attained is illustrated by photographs of patients with lesions in various stages of treatment. Maps showing the location of the cancer tissue on successive days of treatment are exhibited along with the excised specimens and the corresponding frozen sections, which may be viewed under the microscope. Transparencies illustrate the various types of external neoplasms that are amenable to chemosurgical treatment. Pictures of the lesions before, during and after treatment are included. Reconstructions of cancers show the "silent" outgrowths from the main mass of tumor and emphasize the need for the microscopic control of excision. Charts present the rates of cure in the three year and five year periods.

GEORGE L. WALDBOTT, Detroit, and JOHN J. SHEA, Dayton, Ohio:

Contact Dermatitis of the Hands - Localization, a Means of Causative Diagnosis: Photographs demonstrate (1) contact lesions of the hands, (2) the respective causative objects in contact with the hands and (3) fingerprint ink designs of the patterns produced on the hands. The patterns of the lesions are classified according to the size and shape of the causative objects; this makes it possible to catalogue such agents and their patterns for diagnostic purposes. Photographs illustrate how the original patterns are modified by such factors as secondary contact sensitization (e.g., ointments), complicating atopic irritations (ingested food, inhaled substances and the like), secondary infection and previously existing cutaneous lesions.

EDWARD D. DeLAMATER and ROBERT R. KIERLAND, Mayo Clinic, Rochester, Minn.:

Blastomycosis - Blastomyces Dermatides: The exhibit includes a consideration of the clinical features of blastomycosis, both cutaneous and systemic, its history, differential diagnosis and treatment. An exposition of the mycologic routine necessary to diagnose the disease (including direct tissue examination, histopathology, cultural characteristics and animal inoculation) is given. Experimental mycologic aspects of blastomyces including cytology, cultural variation and animal innoculation are presented.

Section on Nervous and Mental Diseases

The representative to the Scientific Exhibit from the Section on Nervous and Mental Diseases is A. B. Baker, Minneapolis.

ROBERT D. WOOLSEY, St. Louis University School of Medicine, St. Louis:

Differential Section of the Fifth Nerve for Trigeminal Neuralgia: Charts indicate symptoms and differential diagnosis, along with anatomic drawings of the fifth nerve and its connections; drawings of operative procedure are presented.

W. JAMES GARDNER and E. C. WEIFORD, Cleveland Clinic, Cleveland:

Closure of Defects of the Skull with Tantalum: The exhibit represents the experience with 106 cases of tantalum cranioplasty in civilian practice. The cases are divided into four groups. Transparencies and photographs illustrate the technic and the results in the various types of cases. Group 1 consists of the repair of old healed cranial defects; group 2, the repair of fresh operative cranial defects; group 3, the repair of recent contaminated traumatic defects, and group 4, the repair of defects in the presence of frank infection.

JOSEPH A. LUHAN, Loyola University School of Medicine and Cook County Hospital, Chicago:

Pathology of Nervous Disorders: Transparencies, photographs and photomicrographs of neuropathologic material routinely encountered in a large general hospital stress conditions of special interest to practitioners, particularly the appearances of the gross specimens in cerebral vascular accidents, brain trauma and infectious, degenerative and neoplastic diseases of the central nervous system. Typical microscopic appearances in some common disorders, particularly epidemic poliomyelitis, are shown.

FREDERIC A. GIBBS, Illinois Neuropsychiatric Institute, Chicago:

Electroencephalography as a General Hospital Service: Original records, diagrams and charts are presented to show the practical value of electroencephalography in neurology, psychiatry, neurosurgery, orthopedics, pediatrics, internal medicine, ophthalmology and otology. The exhibit shows how to set up an electroencephalographic service and gives recommendations for space allocation, staffing, selection of instrument, patient load, supplies, cost factors, installation and depreciation.

W. HORSLEY GANTT and WINTHROP M. PHELPS, Johns Hopkins Hospital, Baltimore, Md.:

The Conditional Reflex Function in Psychiatric and Neuromuscular Disorders: A method is described of measuring the rate of formation of new conditional reflexes, differentiation of stimuli, sensitivity to tactile perception and to pain, latent period, retention, character of muscular movements, stability and susceptibility to disturbances involving conflict. The results obtained are characteristic of certain neuroses, psychoses and muscular disorders. Furthermore, functional disturbances can be differentiated from the organogenic (e.g., brain tumor) and toxicogenic (e.g., endocrine or alcoholic).

GEORGE N. THOMPSON and J. M. NIELSEN, University of Southern California School of Medicine and Los Angeles County General Hospital, Los Angeles:

Area Essential to Consciousness-Cerebral Localization of Consciousness as Established by Neuropathologic Studies: Exhibit demonstrates the area essential to consciousness in the brain. The material has been obtained from 16 cases in which neuropathologic verification was obtained. These studies revealed that bilateral thalamic lesions result in impaired consciousness to a degree of lethargic stupor from which the patient can be partially aroused. Either bilateral thalamic lesions or hypothalamic lesions alone may produce this syndrome. Lesions of the junction of the hypothalamus and of the subthalamus with the mesencephalon result in deep coma from which no degree of recovery is possible. Both the stupor and coma are permanent and irreversible. It is concluded that the engram system essential to crude consciousness is located where the mesencephalon, subthalamus and hypothalamus meet.

Section on Preventive and Industrial Medicine and Public Health

The representative to the Scientific Exhibit from the Section on Preventive and Industrial Medicine and Public Health is Paul A. Davis, Akron, Ohio.

HERMAN E. HILLEBOE, FRANKLYN B. AMOS and GRANVILLE W. LARIMORE, New York State Department of Health, Albany:

Public Health as a Career: The exhibit portrays for the physician the splendid opportunities now offered by a career in public health. It presents typical examples of the activities of public health physicians together with information on positions now available and a brief description of the program of postgraduate fellowships for the training of public health physicians being provided by New York and other states.

W. W. BAUER, WILLIAM W. BOLTON, DEAN F. SMILEY and FRED V. HEIN, Bureau of Health Education, American Medical Association, Chicago:

Medical Examinations of School Children: An exhibit illustrating the values of careful medical examination of school children and contrasting the pediatric type of examination with the hurried cursory inspection done in some schools. The role of the physician as a school medical adviser rather than a mere medical inspector is stressed.

ROBERT W. QUINN, Section of Preventive Medicine, Yale University School of Medicine, New Haven:

Rheumatic Heart Disease—A Study in Differential Prevalence in Rural and Urban Children in Connecticut: The exhibit shows the results of a statewide rheumatic heart disease survey of rural and urban Connecticut school children carried out in 1946, 1947 and 1948, along with some of the epidemiologic factors considered to be significant in rheumatic fever and rheumatic heart disease in Connecticut. The effect of crowding in the home on the rheumatic fever and rheumatic heart disease rates is shown.

AUSTIN SMITH and HAROLD D. KAUTZ, Council on Pharmacy and Chemistry, American Medical Association, Chicago:

Serums and Vaccines in Communicable Diseases: The exhibit covers the prophylactic and therapeutic application of serums and vaccines recognized in New and Nonofficial Remedies and the official compendiums. A simplified classification of serums and vaccines is shown, together with examples of various types of serums and vaccines, and illustrations of the disease manifestation or epidemiologic aspect of significance in the use of a particular agent. A pamphlet is available for distribution.

CHARLES WALTER CLARKE, American Social Hygiene Association, New York:

Serologic Tests for Syphilis in Industries—Exposition of Growth of Serologic Testing Among Industrial Workers: The exhibit deals with the growth of serologic tests for syphilis among industrial workers from 1929 to date and includes the results of three inquiries made by the American Social Hygiene Association regarding "blood testing in industry" in 1929, 1941 and 1947. The practices which should be followed in connection with blood testing in industry are set forth. Publications dealing with the subject will be presented for free distribution.

O. P. KIMBALL, Goiter Study Committee of the American Public Health Association, Cleveland:

Prevention of Endemic Goiter: The exhibit consists of wax models of different types and stages of thyroid changes. Distribution of endemic goiter in the United States, especially in Michigan, West Virginia and Ohio, before and after iodized salt prophylaxis is presented. Photographs describing clinical evidence and stages before and after treatment are shown.

J. S. BENGSTON, C. N. BRAMER, R. C. KLUSSENDORF and W. A. YOUNG, American Veterinary Medical Association, Chicago:

Rabies in Animals: The exhibit shows pictures of animals susceptible to rabies. There is a map showing distribution of rabies in 1946 and a table giving the incidence of rabies in recent years. One panel shows pictures of the procedure followed in making a diagnosis and outlines control measures that work.

ALBERT W. HILBERG, National Cancer Institute, U. S. Public Health Service, Bethesda, Md., and GEORGE N. PAPANICOLAOU, Cornell University Medical College, New York:

The Cytologic Test for Cancer: The exhibit shows photomicrographs of endocervical, vaginal, sputum and urine smears, both normal and atypical. There will be a demonstration with microscopes and slides of the smears to show how the cytologic tests are read.

J.G. TOWNSEND and H.T. CASTBERG, Industrial Hygiene Division, U.S. Public Health Service, Washington, D.C.:

Occupational Disease in Differential Diagnosis: The exhibit stresses the importance of taking an occupational history of every patient to discover possible hazardous exposures. Such information will assist in making the differential and the final diagnosis of an illness. Pathologic and physical observations are shown which may result from either occupational or nonoccupational diseases.

ESTELLA FORD WARNER, U.S. Public Health Service, States Relations Division, Washington:

Extension of Local Health Services: The exhibit consists of maps of the United States, indicating those areas of the country now covered by adequately staffed full time local health departments, the areas of the country now covered by full time local health departments and the organizational pattern suggested by the American Public Health Association completely to cover the United States with full time local health departments.

W.S. WHEELING and H.A. SLESINGER, Windber Hospital, Windber, Pa.:

Anthracosilicosis in the Bituminous Coal Miner: Transparencies of roentgenograms and electrocardiograms of anthracosilicosis are shown, together with charts of pertinent clinical and laboratory data.

REX H. WILSON, GLENN V. HOUGH and WILLIAM E. McCORMICK, Medical Division, B. F. Goodrich Company, Akron, Ohio:

Medical Problems Encountered in the Manufacture of American-Made Rubber: In toxicologic review of the components used in the manufacture of American-made rubber (synthetic rubber) special emphasis is placed on the proper methods of handling and the treatment of persons accidentally overexposed.

PAUL C. CAMPBELL JR., DONALD J. BIRMINGHAM and ROBERT A. SAMMONS, Industrial Hygiene Division, U. S. Public Health Service, Washington, D.C.:

Use and Abuse of the Patch Test: The exhibit presents clinical illustrations and academic facts pertinent to the basic principles of patch testing, the use of the patch test as a diagnostic procedure and conclusions regarding the correct interpretation of positive and negative reactions.

JAMES R. WILSON, Council on Foods and Nutrition, American Medical Association, Chicago:

Vitamin D Milk Program: This exhibit is designed to emphasize (1) the extent of the vitamin D milk program, (2) the degree to which the physician can rely on the vitamin D potency of fortified milk and (3) the desirability of checking the continued reliability of fortified products used by means of biologic assays on "surprise" samples conducted or sponsored by health authorities.

WILLIS S. KNIGHTON, FRANKLIN M. FOOTE and VIRGINIA SMITH BOYCE, National Society for the Prevention of Blindness, New York:

Glaucoma Means Potential Blindness: Charts, posters and graphic devices illustrate signs and symptoms of glaucoma easily recognizable during a general physical checkup.

OREN C. DURHAM, Abbott Laboratories, North Chicago:

Hay Fever Pollen Hazards. Field Studies and Atmospheric Surveys in National Parks and Recreational Areas: A graphic presentation shows the degree of contamination of the air with hay fever pollens throughout the year or at least during the season of heavy patronage in most of the major National Park areas. Most of the Western parks have been found to be free or practically free from ragweeds and ragweed pollen. Other hazards than ragweed have, however, been given due consideration. A gallery of hay fever plants is shown together with the standard gravity slide technic of pollen counting as developed by the exhibitor and approved by the Aero-Allergen Council of the American Academy of Allergy.

ALFRED R. ROOS and JOHN C. ROOS, College of Medical Evangelists, Los Angeles:

Hay Fever Research in the Pacific Southwestern States - Visual Education in Allergy:

The exhibit includes paintings of typical species of allergic importance, charts showing pollination seasons of the different groups, charts showing plant counts in important species, maps showing the complicated distribution of various species, photographs showing abundance of various species close to thickly inhabited areas and specimens of typical plants. Basically the problem of hay fever and pollinosis in its broader aspects in this report is an accurate determination of the local flora. The long pollinating season, the varied geographic and climatic conditions and the unusual diversity and complexity of hay fever-producing plants contrast decidedly with the relative simplicity of the Eastern flora.

Section on Urology

The representative to the Scientific Exhibit from the Section on Urology is John H. Morrissey, New York.

FRED Z. HAVENS, Mayo Clinic, Rochester, Minn.:

Hypospadias-Surgical Correction: The exhibit shows models, photographs and drawings of (1) the various types and degrees of hypospadias and (2) the technic of the surgical treatment of this deformity by *(a)* the use of Edmunds' operation for correction of the chordee and *(b)* the use of the inlying tubular graft for reconstruction of the missing portion of the urethra. A statistical analysis of the results in 36 cases in which surgical treatment has been completed in the last five years is presented.

ALBERT E. GOLDSTEIN, Sinai Hospital and University of Maryland School of Medicine, Baltimore:

Studies in Polycystic Renal Disease: Drawings of the original operation including many specimens are displayed. Diagnosis is stressed particularly in the early cases in which the author believes that relief can be obtained. No absolute cures are possible, but prolongation of life is a factor. A new operative procedure is demonstrated. Pathology is discussed in detail.

ROGER W. BARNES and IVAN E. MARTIN, College of Medical Evangelists, Los Angeles:

Vesicovaginal Fistula: The exhibit shows the technic used for the repair of vesicovaginal fistula, using the inverted lithotomy position and fine catgut. The diagnosis and differential diagnosis and the etiology of vesicovaginal fistula are shown.

ARCHIBALD PERRIN HUDGINS, Charleston, W. Va.:

Perineal Dissection for Repair: The exhibit presents variations in technic in the perineal dissection. The advantages include ease and precision in anatomic dissection; blood loss is minimized and tissues are well exposed and identified for accurate approximation. This procedure is applicable when tissues are friable, and it is time-saving.

IRENE A. KOENEKE, V. E. CHESKY, G. A. WESTFALL, L. E. PECKENSCHNEIDER and THOMAS L. FOSTER, Hertzler Clinic, Halstead, Kan.:

Conservative Pelvic Surgery: Moulages show circulation of the female pelvis and maintenance of this circulation in conservative operations on the uterus and ovaries. The relation of genital and urinary problems is presented, based on the symptoms and observations in 1,000 cystocopic examinations on the female. The effect of castration and the accompanying psychiatric problems are depicted.

LAURENCE F. GREENE, Mayo Clinic, Rochester, Minn.:

Urinary Incontinence in Females Due to Ectopic Ureter: Urinary incontinence may occur in females as a result of ectopic ureters. In this condition the ureter, instead of entering the bladder, opens into the urethra or the vestibule of the vagina and a constant, uncontrollable escape of urine occurs. This distressing anomaly can be easily recognized and completely cured by proper surgical procedures. In addition to illustrative roentgenograms, the exhibit includes a transparent animated model which demonstrates the mechanics of the incontinence.

HARRY R. TRATTNER, St. Vincent Charity Hospital and Cleveland City Hospital, Western Reserve University, School of Medicine, Cleveland:

Improved Radiopacity in Intravenous Urography Prevention of Reactions from Contrast Medium: Comparative studies made from analysis of 1,000 intravenous urograms in normal and pathologic cases are shown. They include variations in density shadows cast by the contrast medium (only "diodrast" employed) in relation to alteration of reaction of urine. Urographic comparisons are as follows: (1) no attempt to change urinary reaction, for purpose of control; (2) administration of acid or alkali prior to urography; (3) urography following acidification and repeated in the same patient after alkalinization. Directions are given for intravenous tolerance test, classification, etiologic basis and method to prevent reactions to the contrast medium.

GEORGE F. CAHILL and M. M. MELICOW, Presbyterian Hospital, Columbia University, New York:

Somatosexual Aberrations in Infants and Children – Role of Adrenal Cortex: Somatosexual aberrations in infancy and childhood can cause doubt and sometimes error in determining sex. The exhibit includes case histories and photographs of genetic females erroneously brought up as males and vice versa. The steps necessary in determining the true sex are outlined and the role of the adrenal cortex discussed. Cases fall into two main groups: (1) infants and children with somatosexual abnormalities without demonstrable adrenocortical enlargement, but with suggestive clinical and laboratory evidence, *(a)* in genetic females; *(b)* in genetic males; (2) infants and children with somatosexual abnormalities with demonstrable adrenocortical enlargement or tumor, as well as clinical and laboratory evidence, *(a)* in genetic females; *(b)* in genetic males.

Section on Orthopedic Surgery

The representative to the Scientific Exhibit from the Section on Orthopedic Surgery is Tom Outland, Elizabethtown, Pa.

HARRY B. MACEY, Scott and White Hospital, Temple, Texas:

Plastic Procedure for Lymphedema of the Extremities: Exhibit demonstrates plastic procedure for the treatment of disabling lymphedema of the upper and lower extremity, demonstrated by the use of moulages and photographs of patient both before and after surgical intervention.

VERNON L. HART and WESLEY H. BURNHAM, Minneapolis:

Congenital Displacement of the Hip Joint During Infancy—Early Recognition and Treatment: It is rare for physicians to treat congenital dislocation and congenital subluxation of the hip before the age of walking because of failure to recognize the malformation in infancy. These malformations present a common etiologic background and may be diagnosed by simple clinical signs. The chief of these are limitation of abduction, shortening of the thigh and the presence of asymmetric skin folds. The early recognition of congenital displacement of the hip permits treatment before secondary changes take place and insures the best possible functional and anatomic result from treatment.

NORMAN L. HIGINBOTHAM and BRADLEY L. COLEY, Memorial Hospital, New York:

Tumors of Bone—Indications for Conservative Surgery: Exhibit consists of charts and photographs of roentgenograms depicting several cases of bone tumors in which conservative measures were feasible in lieu of radical amputation. The indications for conservative measures are emphasized.

EMIL D. W. HAUSER, Chicago:

Cohesive Bandage for Treatment of Clubfoot in the Newborn: A procedure is described which enables the treatment of clubfoot immediately after birth. The technic consists in using cohesive bandage, which will adhere to itself but will not stick to the skin. This is reinforced with waterproof tape. Analysis is made of the various components of the deformity. The method for correcting each component is described, and the order in which they should be corrected is given.

M. G. HARDINGE, College of Medical Evangelists, Loma Linda, Calif.:

Self-Adjusting Hip Bolt and Nail Guide: The exhibit includes (1) a self-adjusting hip bolt which consists of an inner and an outer member so constructed that the proximal end of the outer member is expanded within the head of the femur and the distal end of the inner member is attached to the lateral shaft of the femur. Shortening of the bolt is permitted, but a locking device prevents lengthening. (2) A nail guide for hip nailing is attached to the lateral aspect of the subtrochanteric area. Two guide arms extend, one anterior to and the other lateral to the head nnd neck of the femur, thus affording three dimensional perspective for accurate nail placements.

EARL D. McBRIDE, University of Oklahoma School of Medicine, Oklahoma City:

Lumbosacral Fusion—Wedged Bone Block: A comparatively simple technic of fusing the lumbosacral joint is demonstrated. It consists of dovetailing a block of bone into a rectangular slot, accurately excavated across the articular facets. A buttress is formed by the lamina below and the facets above, in which to apply the principle of distraction by spreading the laminae into flexion. This is one of the important advantages of the procedure. It provides immediate stabilization following removal of the disk. It eliminates severe chipping of the bone tissues, which commonly results in the various methods of Hibbs or Albee modifications. A cadaver specimen is used for demonstration, together with roentgenograms of results. One hundred and twenty-five patients have been surgically treated by this method, and a report has been made on the roentgenologic results of fusion in 38 cases, one to two years after operation.

GARRETT PIPKIN, St. Joseph's Hospital, Kansas City, Mo.:

Indefinite Knee Symptoms Resembling Injured Cartilages: The exhibit illustrates the variations in anatomy of the suprapatellar pouch caused by the communication of the suprapatellar pouch with the knee joint. It is normal for a suprapatellar plica (fold) to occur in the synovia. This fold may become fibrosed, hyalinized or calcified and cause symptoms simulating closely a disturbance of the semilunar cartilage.

LAURENCE JONES, Cedars of Lebanon Hospital, Los Angeles:

Chronic Low Back Pain, Fatigue and Nerve Root Pains (Sciatica)—A Symptom Complex Caused by Foot Imbalance: Drawings illustrate the mechanism causing the symptom complex. The anatomic changes due to primary internal rotation of the feet causing secondary internal rotation of the leg, anterior pelvic tilt with spinal cord tension and root pains at various levels are shown. The varied symptoms are low back pain, fatigue and various types of neuralgias. A fixed and entirely different method of correction of foot posture reverses the preceding changes and brings relief of pain. A radiographic demonstration of the measured change in lumbosacral angle that accompanies changes in foot position is presented. Statistical tables from four different sources will demonstrate approximately 300 cases of chronic low back pain accompanied by different types of neuralgias and sciaticas.

WILBERT McGAW, HAROLD E. SNEDDEN, J. MUCKLEY and MAURICE D. SACHS, Veterans Administration Hospital, Cleveland:

Pneumarthrography of the Knee-An Aid in the Diagnosis of Internal Derangements: The exhibit consists of numerous transparencies showing the technic of air insufflation, roentgenograms of normal knee joints, various types of medial and lateral meniscus tears, cysts, tumors and osteochondritis dissecans. Each roentgenogram is accompanied by a diagrammatic, anatomic sketch and a brief summary of the clinical, surgical and pathologic observations and the end results.

PAUL R. LIPSCOMB, A. M. McKELVIE, A. C. WALSH and J. D. BARGER, Mayo Clinic, Rochester, Minn.:

Alkaline Phosphatase after Transplant of Fresh and Frozen Bone and in Bone Disease: The technic of staining decalcified bone for the presence of alkaline phosphatase is briefly presented. By photomicrographs which show the presence of the enzyme, the regeneration of new bone in rabbits after autogenous transplants can be clearly followed. Likewise, the presence of alkaline phosphatase in a few bone tumors and orthopedic diseases is demonstrated. Half of the exhibit is devoted to a comparative study in the experimental animal of osteogenesis after the transplantation of frozen homogenous bone. This is demonstrated by roentgenograms and by microscopic sections stained to show the presence of alkaline phosphatase.

Section on Gastro-Enterology and Proctology

The representatives to the Scientific Exhibit from the Section on Gastro-Enterology and Proctology are Donovan C. Browne, New Orleans, and J. P. Nesselrod, Evanston, Ill.

DAVID ADLERSBERG and JOSEPH SCHEIN, Mount Sinai Hospital, New York:

Primary and Secondary Sprue-Clinical and Pathologic Studies: Clinical differentiation of the two types of sprue is possible on the basis of duration of symptoms, oral lesions, hematologic changes and response to therapy. Gastrointestinal findings and chemical analyses of blood, duodenal contents and feces are similar in both groups. The pathologic changes consist of hyaline band formation in the villi, trabeculation of the mesenteric nodes, deposition of pigment in the small intestine and varying degrees of pancreatic fibrosis in primary sprue; of amyloid involvement, abdominal lymphosarcomatosis and intestinal lipodystrophy in secondary sprue.

EDWARD LEVY and ANGELO SALA, New York City Cancer Institute, New York:

Anorectal Canal-Anatomic Basis for Examination and Diagnosis: Review of the formation of the anorectal canal provides a general scheme of its clinical architecture. Organization of the muscular components together with their nerve and blood supply gives a basis for anatomic physiology. The epithelial lining, with some gross and microscopic characteristics of malignant disease, is demonstrated. Methods for examination and diagnosis are discussed. A glossary of terms in general use is given. A nomenclature based on anatomic and physiologic grounds is offered as a standard.

HARRY L. SEGAL, JAMES S. WATSON JR., SYDNEY A. WEINBERG, University of Rochester School of Medicine and Dentistry, Rochester, N.Y.:

Gastroscopic Color Photography: The exhibit shows the development of photography of the inside of the stomach. Emphasis is placed on the results in color secured through the flexible gastroscope by means of an external camera and a special power and synchronization unit developed by the exhibitors. The color transparencies obtained in normal patients, as well as in patients with gastritis, gastric ulcer, carcinoma, etc., are displayed. The histories, roentgenograms and photographs of the patients are correlated.

CECIL O. PATTERSON and MILFORD O. ROUSE, Southwestern Medical College, Dallas, Texas:

Differential Diagnosis of Gastric Carcinoma: The exhibit emphasizes the high incidence of gastric neoplasm, stresses the need for earlier and more thorough diagnoses of stomach disorders and demonstrates the characteristic appearance of stomach lesions which are malignant, potentially malignant and benign. Original color drawings of gastroscopic views, photographs of tissue sections, roentgenograms and gross specimens are presented, with condensed case histories and charts.

ALBERT J. SULLIVAN, THOMAS E. McKELL and FREDERICK C. REHFELDT, Ochsner Clinic, New Orleans:

Etiology of Peptic Ulcer-A Psychosomatic Study: There are many etiologic factors involved in the production of peptic ulcer. This exhibit is concerned with the theory of multiple etiology, and a clarifying formula in terms of constitutional, personality, environmental, traumatic and " X " factors is presented. The major personality types and the precipitating emotional situations involved are discussed. Observations based on personality studies as well as medical surveys on 1,000 cases of peptic ulcer are summarized. From the data obtained from certain clinical groupings it is possible to make valid diagnostic and prognostic conclusions. Representative case histories will be available.

MALCOLM R. HILL, CARROL S. SMALL and LEE J. RICHARDS, College of Medical Evangelists, Loma Linda and Los Angeles:

A Study of the Development of Anal Ducts and Glands with Particular Reference to the Pathogenesis of Anorectal Disease: Exhibit consists of models and photomicrographs representing a study of the development of anal glands in forty-nine fetuses, ranging in size from 9.5 to 38 cm. Correlation is made with a previous study of various age groups together with clinical consideration as to histopathology of anorectal disease.

HAROLD R. ROSSMILLER, Cleveland Clinic, Cleveland:

Gastroscopic Examination: Demonstrations of the method, value and limitations of gastroscopic examination in the diagnosis of intragastric lesions are presented and a human model and case histories with roentgen and gastroscopic findings are included.

ELMER H. LOUGHLIN, SAMUEL H. SPITZ and RICHARD H. BENNETT, with the assistance of JEROME B. MARGOLIES, Long Island College of Medicine and Long Island College Hospital, Brooklyn:

Diagnosis of Helminth and Protozoal Infections of the Gastrointestinal Tract: Diagnostic technics considered from the aspects of practicability and comparative efficacy when employed in hospital as well as private practice, including a systematic approach in the diagnosis of these infections, are presented.

Section on Radiology

The representative to the Scientific Exhibit from the Section on Radiology is S. W. Donaldson, Ann Arbor, Mich.

J. GERSHON—COHEN and A. G. COOLEY, Philadelphia:

Facsimile Roentgenography: The exhibit consists of transmission and reception apparatus to demonstrate facsimile transmission of roentgenograms and the applications of this medium in solving the roentgenologic services for small community, small hospitals, ships at sea, outlying centers where radiologists are not available, etc.

BENJAMIN FELSON, University of Cincinnati, Cincinnati:

Significance of Appendical Calculi: The incidence of appendical calculi, their frequent association with acute appendicitis and the simplicity of their diagnosis by means of roentgen studies are demonstrated on charts and roentgenograms. The infrequency of appendical calculi in the normal appendix and their frequency in acute appendicitis (obtained from roentgenographs of a large number of surgical and autopsy specimens) are stressed.

HEINZ S. WEENS, JAMES V. WARREN, DAVID F. JAMES and HERBERT M. OLNICK, Emory University School of Medicine, Atlanta, Ga:

Contrast Visualization of the Vascular System: The exhibit demonstrates recently developed methods of roentgen visualization of the vascular system in man. It includes (1) constrast visualization of the heart chambers, pulmonary artery and aorta in various important clinical conditions; (2) visualization of the superior and the inferior vena cava in normal and pathologic states with emphasis on venous obstruction and the pattern of collateral circulation, and (3) a simple method of contrast visualization of the vascular system of the kidneys (nephrography).

LEE A. HADLEY, Syracuse, N.Y.:

Intervertebral Foramen Studies: Dissections of normal and abnormal intervertebral foramina mounted in transparent plastic together with the roentgenogram and stained sections from the specimen are presented. Roentgenograms of patients show different types of foramen encroachment. (1) physiologic; (2) traumatic; (3) degeneration of intervertebral disk with *(a)* spur formation backward from the disk margin, *(b)* spur formation forward from the posterior articulation, *(c)* pedicles coming closer together, *(d)* subluxation with telescoping of the posterior articulation forward into the foramen and wedging forward of the underlying body and *(e)* hyperplasia of the posterior capsule or ligamentum flavum; (4) disk substance bulging backward into the foramen causing nerve root pressure. The symptoms of nerve root pressure have unfortunately come to be diagnosed as "herniation of the nucleus pulposus." This is usually sought in the spinal canal. Too often the area of real pressure is overlooked, being situated more laterally in the less accessible intervertebral foramen.

C. C. BIRKELO and W. L. BROSIUS, Herman Kiefer Hospital, Detroit, and Tuberculosis Control Division, U. S. Public Health Service, Washington, D.C.:

Pulmonary Diseases—Correlation of Roentgenologic and Pathologic Findings: The exhibit consists of reproductions of antemortem and postmortem roentgenograms illustrating changes in pulmonary disease, including changes in the arterial system. Sectioned gross specimen photographs of each case are shown and a brief case history reproduced.

Section on Anesthesiology

The representative to the Scientific Exhibit from the Section on Anesthesiology is Urban H. Eversole, Boston.

JOHN ADRIANI and JOHN P. HOWARD, Charity Hospital and Louisiana State University School of Medicine, New Orleans:

Some Common Errors in the Management of Spinal Anesthesia: The errors commonly made in inducing and managing spinal anesthesia which lead to avoidable accidents, failures, untoward reactions and death are shown by means of photographs, charts and graphs. Each error or breach of technic is shown together with the correct or accepted method and explanation of the fundamental principles which are violated.

RICHARD C. THOMPSON and WILLIAM B. NEFF, Stanford University School of Medicine, San Francisco:

Newer Analgesic Drugs in Anesthesiology: The exhibit presents an experimental and clinical comparison of morphine with meperidine and several new closely related analgesics for fortifying the pain-relieving and reflex-obtunding qualities of nitrous oxide and oxygen anesthesia; graphs and kymographic records are shown

ALBERT FAULCONER JR., Mayo Clinic, Rochester, Minn.:

An Acoustic Gas Analyzer for Research in Anesthesiology: An acoustic method for the continuous determination of the percentage of constituents in certain gas mixtures is described. The use of this instrument with certain other devices for measuring physiologic variables is discussed and examples of photographic records obtained in these studies are presented. The possibility of adapting this equipment to other types of study is discussed.

J. EUGENE RUBEN, PATRICIA-MARY KAMSLER and W. LYALL HOWELL JR., Philadelphia General Hospital, Philadelphia:

Prolonged Spinal Anesthesia for Surgical Reduction of Hip Fracture: The exhibit consists of charts, diagrams and illustrations describing the technic of unilateral spinal anesthesia as used in old, poor risk patients and the results obtained with it.

Section on General Practice of Medicine

The representative to the Scientific Exhibit from the Section on General Practice of Medicine is M. B. Casebolt, Kansas City, Mo.

HAROLD M. CAMP, JAMES H. HUTTON, CHARLES P. BLAIR, FRANCES C. ZIMMER and ANN FOX, Illinois State Medical Society, Chicago and Monmouth:

The Doctor and His Medical Society: The organization and work of the society are shown. Through the committees of the society, the physician improves his own medical knowledge and facilities and thus better serves his patients. At the same time, he strives to educate the public in health problems and to stimulate activities which will carry sound policies into effect. The exhibit is amplified by material from the Committee on History, including a collection of old record books, an original membership certificate issued in 1841, some of the original transactions of the House of Delegates, old medical books, physicians' ledgers and record books one hundred years old or more, and schedules from about 1860.

DON H. DUFFIE, Central Lake, Mich.:

Practical Office Colorimetry - A Neglected Principle: Visual measurement of light transmission (not color matching) is presented. Speed, simplicity, economy and precision in determination of hemoglobin, dye excretion, etc., and also in the reading of colorimetric tests in general are stressed. The instrument is demonstrated.

J. O. KELLEY, J. C. GRIFFITH, L. J. VAN HECKE, C. SHERRILL RIFE and R. A. FRISCH, Medical Society of Milwaukee County, Milwaukee:

A County Medical Society Attacks Cancer--Activities of the Cancer Committee of The Medical Society of Milwaukee County: The organization of the Cancer Committee of The Medical Society of Milwaukee County is shown and its relationships to the various organizations interested in cancer. Specific projects undertaken by this committee include over-all community cancer statistical studies, projects in association with the American Cancer

Society, the establishment of cancer symposiums (professional education program), development of a cancer detection center and the sponsorship of teaching and research.

E. FULLERTON COOK, United States Pharmacopoeial Convention, Philadelphia:

United States Pharmacopoeia: The exhibit presents the thirteen standardized preparations of digitalis official in the Pharmacopoeia today, and reviews the development of digitalis preparations from the first U.S.P. of 1820, when only the tincture and infusion were official.

C. H. HEACOCK and L. W. KIBLER, Postgraduate Committee, Tennessee State Medical Association, Memphis:

Postgraduate Medical Education--Cancer Education by Medical Extension Plan: A map of Tennessee shows the ten circuit districts for postgraduate instruction in cancer. Within the circuit districts are shown also the forty-nine teaching centers where the postgraduate instruction is given under the extension plan for physicians. Charts show the agencies sponsoring the program with financial contributions and a history of ten years of postgraduate extension medical teaching with the results tersely stated in a comparative study.

ALBERT LEVIN, Biological Photographic Association, Pittsburgh:

Photography of Patients: Photographs in black and white and color, contributed by members of the Biological Photographic Association, illustrate the requirements of clinical photography for publication, teaching and records. Technical details accompany each picture. Special emphasis is placed on close-up work, such as the photography of skin lesions, etc. Experienced clinical photographers will answer questions about the materials, apparatus and methods used in the various fields of medical photography.

WILLIAM P. BOGER and J. Wm. CROSSON, Philadelphia General Hospital, Philadelphia:

Caronamide--Application to Enhancement of Penicillin Therapy: Caronamide orally administered results in the enhancement of penicillin plasma concentration by two to seven fold. The mode of action of this drug is presented schematically. The caronamide plasma concentrations resulting from various doses of the drug administered orally and parenterally are presented and also correlation of these concentrations and their effect on penicillin plasma concentrations. The effect of caronamide on penicillin plasma concentrations following the administration of both the usual and massive doses of the antibiotic is demonstrated. Dosage schedules of caronamide, practical clinical applications, untoward effects and influence of caronamide on other compounds are outlined.

ROBERT P. FISCHELIS, American Pharmaceutical Association, Washington, D. C.:

Pharmacy's Service to Medicine: The exhibit depicts various services of pharmacy to the practice of medicine as well as illustrations of the service of the laboratory of the American Pharmaceutical Association to standardization of drugs. It includes illustrations of drug standards found in the National Formulary, published by the Association, and data on the revision procedure and shows the work of the Division of Hospital Pharmacy, the Division of Prescription Practice and the Division of Publications of the American Pharmaceutical Association as they relate to the direct services provided for the practitioner of medicine.

MISCELLANEOUS EXHIBITS

Exhibits on various miscellaneous subjects are shown under this heading. They include a group of exhibits on diabetes, cancer, poliomyelitis and atomic energy.

WILLIAM T. DORAN, Department of Medicine and Surgery, Veterans Administration, Washington, D.C.:

The Medical Education Program of the Veterans Administration: The exhibit presents the structure and operation of the Veterans Administration medical education program separated into its chief component parts and showing the relation of each part to the others.

G. FOARD McGINNES, American National Red Cross, Washington, D.C.:

Disaster Medical Operations: The services of physicians and nurses at the scene of a disaster are shown, as well as the support given the physician through the first-aid services, the blood program, nursing, nutrition, canteen service and motor service.

ROBERT M. FINK and KAY FINK, Veterans Administration Hospital, Van Nuys, Calif.:

Filter Paper Partition Chromatography: The simple type of apparatus used in one and two dimensional filter paper partition chromatography will be on display. Sample chromatograms of amino acids, sugars, organic acids and other classes of compounds will be shown, as well as radioautographs prepared from chromatograms containing radioactive compounds. Included also will be diagrams describing the process and a demonstration of the process with colored compounds showing the gradual separation of the components of a mixture as the chromatogram is developed.

EVERETT S. ELWOOD, National Board of Medical Examiners, Philadelphia:

Qualifying Examinations for Entrance to Medical Practice: The exhibit describes the work and progress of the National Board of Medical Examiners and includes the results of its examinations as well as the use of these examinations by medical schools.

DONALD G. ANDERSON, F. H. ARESTAD, WILLIAM R. ALBUS, EDWARD K. REID, EDWARD H. LEVEROOS and WILLIAM W. CORBETT, Council on Medical Education and Hospitals, American Medical Association, Chicago:

Medical Education and Hospitals: The exhibit displays data on medical education, medical licensure, registration of hospitals, approval of internships, residencies and fellowships, schools for medical technologists, x-ray technicians, physical therapy technicians, occupational therapy technicians and medical record librarians. Revised lists of approved medical schools, hospitals approved for internships and residencies and fellowships and approved technical schools are shown.

Diabetes

HUGH L. C. WILKERSON, MALCOLM J. FORD, DONALD HARTING and ERICH HEFTMANN, Diabetes Section, U.S. Public Health Service, Boston:

Simplified Case Finding in Diabetes Control: There are presented new developments in diabetes case finding; exhibit and demonstration of a new, rapid, screening blood glucose test; blood sugar values on 2,000 "normal" persons from Brookline, Mass., in relation to time elapsed since last meal, and study of the incidence of diabetes in relatives of a known group of diabetic persons in Jacksonville, Fla. Physicians are invited to have the screening blood glucose test or they actually may perform the tests themselves.

SAMUEL SOSKIN, RACHMIEL LEVINE and HARRY F. WEISBERG, Michael Reese Hospital, Chicago:

Diabetes—Disturbance in Blood Sugar Regulation: The exhibit describes the homeostatic mechanism for the regulation of the blood sugar level, the roles of the endocrine glands in this regulation and the manner in which this regulation is disturbed in experimental diabetes and in diabetes mellitus. Included also is material on the application of this knowledge to the treatment of diabetes mellitus. With this material as a background, the focus of interest in the exhibit will be a working machine representing a mechanical analogy of the blood sugar-regulating mechanism. By means of the level of water in a tank, maintained by mutually regulated inflows and outflows, the machine will record graphs analogous to the normal dextrose tolerance curve. Various adjustments representing endocrine glands will produce abnormal tolerance curves analogous to those seen in endocrine disturbances.

EDWARD S. DILLON, Philadelphia, CHARLES H. BEST, Toronto, GEORGE E. ANDERSON, Brooklyn, N. Y., and FRANK N. ALLAN, Boston, American Diabetes Association:

Diabetes in 1948: The high incidence of hidden diabetes has been demonstrated through the case-finding surveys of the United States Public Health Service and other studies. For every 4 known cases, there may be found 3 cases previously unrecognized. It is now estimated that there are 1,000,000 hidden cases of diabetes in the United States. The American Diabetes Association has taken as a major objective in 1948 the effort to bring these persons with hidden diabetes to light--to find them, treat them and teach them.

HOWARD F. ROOT, ELLIOTT P. JOSLIN, PRISCILLA WHITE, ALEXANDER MARBLE, ALLEN P. JOSLIN, C. C. BAILEY and HERBERT H. MARKS, George F. Baker Clinic, New England Deaconess Hospital, Boston, and Metropolitan Life Insurance Company, New York:

Diabetes in Camp, Home and Hospital: The exhibit presents new data on arteriosclerosis in childhood diabetes compared with diabetes in young adults, treatment of pregnancy and coma, statistical data and plans for a new camp for diabetic boys.

Clinics and Conferences on Diabetes

Clinics and conferences on diabetes will be conducted by members of the George F. Baker Clinic and the American Diabetes Association under the chairmanship of Dr. Howard F. Root, Boston, in an area adjoining the group of exhibits on diabetes. Emphasis will be laid on a search for the million undiscovered persons with diabetes, earlier diagnosis and treatment to avoid coma, aggressive rather than expectant treatment, abolition of death from coma, special care for pregnant diabetics and the education of the patient in the fundamentals of diabetic treatment.

The program follows:

MONDAY, June 21

12 noon. *A Million Unknown Diabetics.* Elliott P. Joslin, Boston.

12:30 p.m. *Insulin and the Future.* Charles H. Best, Toronto.

1 p.m. *Interpretation of Blood Sugar Values.* Herman O. Mosenthal, New York.

1:30 p.m. *Diet and Insulin.* Henry T. Ricketts, Chicago.

2:00 p.m. *Acidosis and Coma.* Howard F. Root, Boston.

2:30 p.m. *Insulin Difficulties, Allergy, Atrophy.* Henry B. Mulholland, Charlottesville, Va.

3:00 p.m. *Cushing's Syndrome.* A. L. Chute, Toronto.

3:30 p.m. *Hypoglycemia.* Charles W. Styron, Raleigh, N. C.

4:00 p.m. *Childhood Diabetes.* Priscilla White, Boston.

4:30 p.m. *Insulin Resistance.* I. Arthur Mirsky, Cincinnati.

5:00 p.m. *Advantages of Insulin in Early Treatment.* Walter H. Nadler, Chicago.

TUESDAY, June 22

9:00 a.m. *Arteriosclerosis.* George E. Anderson, Brooklyn.

9:30 a.m. *Diabetic Feet.* William H. Olmsted, St. Louis.

10:00 a.m. *Ketosis and Diabetes.* Rollin T. Woodyatt, Chicago.

10:30 a.m. *Pregnancy and Diabetes.* Priscilla White, Boston.

11:00 a.m. *Diabetic Neuropathy.* R. Wayne Rundles, Durham, N. C.

11:30 a.m. *Case Finding Surveys. U. S. Public Health Service.* Hugh L. C. Wilkerson, Boston.

12 noon. *New Blood Sugar Method.* Erich Heftmann, Boston.

12:30 p.m. *Diabetes Today.* Elliott P. Joslin, Boston.

1:00 p.m. *Blood Sugar Levels.* Edward S. Dillon, Philadelphia.

1:30 p.m. *Treatment During Surgery.* Howard F. Root, Boston.

2:00 p.m. *Diet and Treatment.* Frank N. Allan, Boston.

2:30 p.m. *Hyperinsulinism.* Jerome Conn, Ann Arbor, Mich.

3:00 p.m. *Diabetes During Surgery.* E. Paul Sheridan, Denver.

3:30 p.m. *Diabetes in Childhood.* Henry J. John, Cleveland.

4:00 p.m. *Use of Insulin.* Harry H. Bromley, Cleveland.

4:30 p.m. *Transmetatarsal Amputations.* Clifford C. Franseen, Boston.

WEDNESDAY, June 23

9:30 a.m. *Pregnancy.* Lester J. Palmer, Seattle, Wash.

10:00 a.m. *Control of Diabetes.* Elliott P. Joslin, Boston.

10:30 a.m. *Treatment of Diabetic Feet.* Frederick W. Williams, New York.

11:00 a.m. *Diabetic Coma and Potassium Deficiency.* Howard F. Root, Boston.

11:30 a.m. *Diagnostic Problems.* Chester Coggeshall, Chicago.

12 noon. *Emergencies.* Allen P. Joslin, Boston.

12:30 p.m. *Diabetic Neuritis.* Thomas P. Sharkey, Dayton, Ohio.

1:00 p.m. *Interpretation of Diabetic Statistics.* Herbert H. Marks, New York.

1:30 p.m. *Hyperinsulinism.* Alexander Marble, Boston.

2:00 p.m. *Arteriosclerotic Complications.* Byron D. Bowen, Buffalo, N. Y.

2:30 p.m. *Insulin Resistance.* Leon S. Smelo, Birmingham, Ala.

3:00 p.m. *Intercapillary Glomerulosclerosis.* Henry T. Ricketts, Chicago.

3:30 p.m. *Hyperglycemia and Insulin.* Allen P. Joslin, Boston.

4:00 p.m. *Protection of Remaining Extremity in Diabetic Amputations.* Geza de Takats, Chicago.

4:30 p.m. *Thyroid and Pituitary Complications.* Howard F. Root, Boston.

THURSDAY, June 24

10:00 a.m. *Acidosis.* Howard F. Root, Boston.

10:30 a.m. *Treatment Before and After Surgery.* Blair Holcomb, Portland, Ore.

11:00 a.m. *Tuberculosis and Diabetes.* Howard F. Root, Boston.

11:30 a.m. *Intermediate Insulins.* Arthur R. Colwell, Evanston, Ill.

12 noon. *Complications, Including Hemochromatosis.* Alexander Marble, Boston.

12:30 p.m. *Control of Diabetes.* Joseph H. Barach, Pittsburgh.

1:00 p.m. *Management of the Ambulant Diabetic.* Allen P. Joslin, Boston.

1:30 p.m. *Hypoglycemia, Prevention and Treatment.* Cecil Striker, Cincinnati.

2:30 p.m. *Adenomata of the Pancreas.* Alexander Marble, Boston.

3:00 p.m. *Insulin Mixtures.* Franklin B. Peck, Indianapolis.

3:30 p.m. *Diabetic Coma.* Alexander Marble, Boston.

4:00 p.m. *Severe Diabetes.* Robert W. Keeton, Chicago.

4:30 p. m. *Emergencies (Diabetes "by Phone").* Allen P. Joslin, Boston.

FRIDAY, June 25

10:00 a.m. *Control of Diabetes.* Alexander Marble, Boston.

10:30 a.m. *Insulin and Early Diabetes.* Allen P. Joslin, Boston.

11:00 a.m. To be announced.

Cancer Detection

Cancer detection clinics and the importance of cancer detection in the physician's office will be presented under the auspices of the following committee:

Augusta Webster, Chicago, Chairman.
Charles Branch, Chicago.
M. Alice Phillips, Chicago.
F. Lee Stone, Chicago.
Danely P. Slaughter, Chicago.
Kate Edison, Chicago.

Following are the members of the Advisory Committee:

Bowman C. Crowell, American College of Surgeons, Chicago.
Brewster S. Miller, American Cancer Society, New York.
John A. Rogers, Illinois Division, American Cancer Society, Chicago.
James P. Simonds, Northwestern University Medical School, Chicago.
John A. Wolfer, Cancer Committee, Chicago Medical Society, Chicago.

Several of the hospitals in Chicago which conduct cancer detection clinics are also lending aid.

The exhibits will show the following:

Standards for Detection Centers, as set up by the American College of Surgeons.
History and Physical Examination Forms and Card Index.
Collection of Statistical Data.
Laboratory Data.
Roentgen Findings in Cancer.
General Physical Examinations.
Skin Cancer and Mucous Membranes.
Eye, Ear, Nose and Throat Examinations.
Cancer of the Male and the Female Genital Tract
Proctoscopic Examinations and Findings.
Cancer of the Breasts.

The exhibits will be accompanied by appropriate charts showing the incidents of accessible cancer, and the instruments needed for detection will be displayed.

Poliomyelitis

C. E. IRWIN and ROBERT L. BENNETT, Georgia Warm Springs Foundation, Warm Springs, Ga., with the assistance of the National Foundation for Infantile Paralysis, New York:

Treatment of Poliomyelitis: The seven stages of treatment of poliomyelitis are shown: (1) save patient's life, (2) prepare for motion, (3) coordinate function and increase strength, (4) increase functional activity, (5) evaluate functional capacity, (6) return home and (7) orthopedic surgery and assistive appliances.

Atomic Energy

HOWARD A. CARTER and FREDERIC T. JUNG, Council on Physical Medicine, American Medical Association,

Atomic Energy--Medical and Physical Aspects: This exhibit consists of (1) demonstrational apparatus, (2) charts and (3) reference material and reprints. There will be a demonstration periodically dealing with the mechanical and electrical makeup of a Geiger-Mueller counter. Charts will briefly describe the most recent information on the therapeutic and diagnostic uses of radioactive isotopes. Pamphlets containing a glossary of terms used in atomic energy and nuclear physics will be distributed. A primer on the medical aspects of atomic energy will be available.

The following consultants have contributed to this exhibit and will aid in the demonstrations:

Edwin C. Ernst, Barnard Free Skin and Cancer Hospital, St. Louis.
Hymer L. Friedell, University Hospitals of Cleveland, Cleveland.
Robert J. Moon, University of Chicago, Chicago.
Robert R. Newell, Stanford University, San Francisco.
Eugene P. Pendergrass, University of Pennsylvania, Philadelphia.
Edith H. Quimby, Columbia University, College of Physicians and Surgeons, New York.
Albert E. Shaw, University of Chicago, Chicago.
Shields Warren, New England Deaconess Hospital, Boston.
Stafford L. Warren, University of California, Los Angeles.
J. L. Weatherwax, American Oncologic Hospital, Philadelphia.

PAUL C. AEBERSOLD and B. G. SAUNDERS, Isotopes Division, and A. H. HOLLAND JR., Office of the Medical Advisor, Atomic Energy Commission, Oak Ridge, Tenn.:

Radioisotopes and Radiation: Exhibits include diagrams and charts explaining radioisotopes and radiation. Photographs explain how radioisotopes are produced in the chain-reacting pile at Oak Ridge and how they are handled and shipped. Charts show the distribution of isotopes according to isotope and geographic location. Illustrative material will be presented on the use of isotopes in therapy, diagnosis and medical research. Actual shipping containers for the various isotopes and representative samples of radioactive materials will be on display.

LEON O. JACOBSON, MATTHEW H. BLOCK, EDNA K. MARKS and EVELYN O. GASTON, Argonne National Laboratory and University of Chicago, Chicago:

Effect of Induced Anemia on Radiation Damage: The exhibit shows that in normal rabbits given a median lethal dose of roentgen radiation (800 r total body) anemia develops which reaches its maximum fourteen days after exposure; in animals that are already anemic by virtue of administration of phenylhydrazine or phlebotomies no further anemia develops after exposure to the median lethal dose of roentgen radiation. Photomicrographic illustrations demonstrate that this difference in effect is due to the virtually complete destruction of erythrocyte precursors in the normal animal after irradiation; in animals already anemic before irradiation, a sufficient number of erythrocyte precursors survive the irradiation to insure a normal production of erythrocytes.

MORRIS T. FRIEDELL, FENTON SCHAFFNER and Wm. J. PICKETT, Hektoen Institute for Medical Research of Cook County Hospital, Chicago:

Radioactive Isotopes—Index of Circulation in Peripheral Vascular Diseases; Effects of Treatment: Radioactive phosphorus or sodium is injected intravenously. Quantitative and qualitative estimates of circulation in normal persons and in persons with peripheral vascular diseases are made, using a Geiger counter. An index of circulatory efficiency is established in persons with normal peripheral circulation. This is compared with an index obtained from persons with peripheral vascular disease. The method of establishing this index and its significance are presented. Alterations of this index are displayed as indicative of relative effects and efficiencies of various methods of treatment of peripheral vascular disease.

DANIEL C. ELKIN and FREDERICK W. COOPER JR., Emory University School of Medicine, Atlanta, Ga.:

Radioactive Isotopes—Their Use as Tracers in Peripheral Circulatory Disturbances: Exhibit demonstrates the methods of utilizing radioactive sodium as a tracer in studies on the circulation. The results of studies are shown.

MYRON PRINZMETAL, ELIOT CORDAY, RAMON J. SPRITZLER and H. C. BERGMAN, Cedars of Lebanon Hospital, Los Angeles:

Radiocardiography—A Method for Studying the Flow of Blood Through the Heart by Means of Radioactive Isotopes: Graphic visualization of the flow of blood through the heart of intact man can now be achieved. Radioactive sodium (Na^{24}) is injected intravenously and traced with specially designed ink-writing Geiger-Mueller counters. One counter tube is placed over the precordium. The recorded curves then represent the blood as it is pumped through the chambers of the heart. The first ascent records the blood as it enters the right heart; as the right ventricle empties, the curve descends. The second wave rises as the blood returns from the pulmonary circuit to the left chambers and descends when the blood is expelled from the left ventricle. Records are shown which are characteristic of such heart conditions as congestive failure and congenital heart disease. The diagnostic and physiologic significance of this new method are demonstrated. Venous return is also easily traced by placing another counter tube over a vein between the site of injection and the heart. In this way, data has been obtained which has increased knowledge and understanding of venous thrombosis, the peripheral circulation and circulation time. Radiocardiography thus offers a new, graphic method for the study of hemodynamics.

UNITED STATES ARMY, UNITED STATES NAVY and UNITED STATES AIR FORCE, Department of National Defense, Washington, D.C.:

A General Practitioner in the Atomic Age: The Army, Navy and Air Force of the Department of National Defense will display jointly an exhibit designed to show the basic principles of radiation due to the explosion of an atomic bomb, the relationship of fission products to the practice of medicine and general information relative to internal and external injuries and the therapeutic principles applicable thereto.

HERMAN LISCO, MIRIAM P. FINKEL, AUSTIN M. BRUES and JANE GLASER, Argonne National Laboratory, Chicago:

Pathologic Effects of Radioactive Elements: The exhibit will consist of colored photographs indicating the pathologic changes encountered when plutonium and radioactive isotopes are administered to animals. These changes include hepatic diseases caused by plutonium and various types of tumors and skin changes due to radioactivity. There will also be reproductions of roentgenograms of animals showing bone changes.

PHILIP M. MORSE, ROBERT D. CONRAD and LESLIE F. NIMS, Brookhaven National Laboratory, and ELDON C. SHOUP, Associated Universities, Inc., Upton, N. Y.:

Research Facilities: The exhibit depicts the role of Brookhaven National Laboratory as the regional center for the Northeast in fundamental nuclear research. Brookhaven's principal purposes are to carry through fundamental research and to provide staff and research facilities for the training of scientists and for work being done by accredited scientists and institutions in the region. Acting as the agent for all the educational institutions in the Northeast, nine universities formed Associated Universities, Inc., a nonprofit corporation which is the contractor for the building and administration of the Laboratory under the auspices of the United States Atomic Energy Commission.

ROBERT T. NIESET, WALTER J. TRAUTMAN Jr., RALPH M. BELL, BLANCHE PORTER, WILLIAM PARSON, CHAMP LYONS and H. S. MAYERSON, Tulane University School of Medicine and Alton Ochsner Medical Foundation, New Orleans:

Measurements of Total Red Cell Mass with Patients' Cells Tagged with P^{32}: The exhibit shows a method for the determination of total red cell volume and its application to clinical problems. A 10 cc. sample of venous blood is incubated with radioactive phosphorus (P^{32}) and the tagged cells reinjected into the patient, allowed to mix for ten minutes, and a second sample of blood taken for estimation of the dilution which has occurred. The general principles involved, the method of separation and preparation of the red cells for reinjection and radioactive assay and calculation will be described. Evidence for binding of radioactive phosphorus by the red cell and data on the accuracy of volumetric technics as well as on the reproducibility of the radioactive measurements will also be given. Applications of the method to surgical and medical cases involving various dietary procedures, transfusion, etc. will be presented.

MOTION PICTURES

Two motion picture theaters, located in rooms adjacent to the exhibits, will be in continuous operation. Each film will be shown once daily, Monday morning to Friday noon, on a definite schedule.

GEORGE E. SHAMBAUGH JR., Northwestern University Medical School, Chicago:

The Fenestration Operation for Otosclerosis: The film consists of animation in part, depicting the steps of the fenestration operation, followed by an actual picture of the operation itself on a patient, beginning with the hearing test before operation and ending with her audiogram three weeks after operation. In addition to the technic of the operation, the indications for it are briefly taken up. Silent, forty-three minutes.

PAUL H. HOLINGER, University of Illinois College of Medicine, Chicago:

Organic Disorders of the Larynx: The film shows the various disorders of the larynx which affect speech. It stresses the relation of organic pathologic changes to vocal function and shows various types of benign and malignant tumors, paralyses and inflammatory processes of the larynx as they appear on the laryngeal mirror or through the direct laryngoscope. Silent, twenty-five minutes.

ROGER W. BARNES and IVAN E. MARTIN, College of Medical Evangelists, Los Angeles:

Repair of Vesicovaginal Fistula: Motion picture shows the technic of repair of vesicovaginal fistulas. The inverted Trendelenberg position is used and a thick layer of tissue is built up between the bladder and the vagina. Silent, color, twelve minutes.

M. H. KNISELY, W. K. STRATMAN-THOMAS, T. S. ELIOT and E. H. BLOCK, University of Chicago, Chicago, and University of Tennessee, Memphis, Tenn.:

Knowlesi Malaria: This is the first motion picture taken through a microscope showing the pathologic circulatory physiology in a living animal through the whole course of a mammalian disease. The film shows that normal circulating blood is not agglutinated and shows the course of events after the development of the killing sludge. The effect of one drug in breaking up the masses of which the sludge is composed is presented. Silent, forty minutes.

WILLIAM BICKERS, Richmond, Va:

Primary Dysmenorrhea: The motion picture shows a study of the endometrial pattern, basal temperature curve, myometrial contraction patterns, and intrauterine pressures in patients with dysmenorrhea. The intrauterine balloon technic for recording uterine contractions is presented. Treatment is discussed. Silent, forty-nine minutes.

MYRON PRINZMETAL, H. C. BERGMAN, ELIOT CORDAY, H. E. KRUGER, LOIS SCHWARTZ, ETHEL FOLADARE, R. J. SPRITZLER and S. A. SANFORD, Cedars of Lebanon Hospital, Los Angeles:

Studies in Coronary Circulation: Selected studies in coronary artery disease are presented in slow-motion color pictures, some taken at 1,000 frames per second (up to 65 times normal speed). By the intravenous injection of fluorescein, (made photographically visible under near-ultraviolet light), the coronary circulation is visualized. Shock is revealed as an aggravating force in causing myocardial damage when associated with coronary insufficiency or coronary occlusion. Coronary arteries are proved not to be end arteries physiologically. Other included studies show the effects of asphyxia; the amazing myocardial reserve (15 per cent of contracting myocardium is sufficient to maintain normal hemodynamics), and a vivid first photographic demonstration of coronary artery spasm. Silent, thirty minutes.

LOUIS E. MOON and J. B. CHRISTENSEN, Creighton University School of Medicine, Omaha, Neb.:

An Improved Technic for the Operative Treatment of Anorectal Lesions: Simple, practical and successful methods of making proctologic examination are presented and operative procedures for the treatment of common anorectal lesions demonstrated. A routine proctologic examination is shown, with animated, anatomic illustrations reviewing the anatomy of the region followed by close-up shots of the examination in actual cases. A simple ligature type of operation for removal of internal and external hemorrhoids is shown, as well as operations for anal fissure, abscess and a simple fistula. Silent, forty-four minutes.

WALTMAN WALTERS, Mayo Clinic, Rochester, Minn.:

Transabdominal Resection of the Gastric Nerves (Vagi) in the Treatment of Peptic Ulceration: The technic of transabdominal vagotomy is shown in a case of gastrojejunal ulcer. The film shows a few steps of the removal of the gastroenterostomy and the gastrojejunal ulcer so as to orient the audience. The major part of the film consists of the exposure of the lower part of the esophagus, demonstration of the vagus nerves and their section. Silent, seventeen minutes.

MALCOLM R. HILL and ROBERT L. BELT, College of Medical Evangelists, Los Angeles:

Two Team Abdominoperineal Resection: The picture shows operating room setup, with technical approach for two team abdominoperineal resection for carcinoma of rectum. Silent, nine minutes.

PHILIP THOREK, Chicago:

Surgical Treatment for Carcinoma of the Lower End of the Esophagus: This case presents the extension of a carcinoma of the cardiac end of the stomach into the esophagus. A transthoracic partial esophagogastrectomy was performed with an end to side esophagogastrostomy. Roentgenograms and the patient's postoperative course amplify the film. Silent, forty-six minutes.

ARNOLD S. JACKSON, Jackson Clinic, Madison, Wis.:

Electrosurgical Thyroidectomy for Hyperthyroidism: This picture illustrates some of the important tests used in the diagnosis of hyperthyroidism. It shows the preoperative steps used for thyroidectomy, the technic of operation, with both the scalpel and the electrosurgical knife, and the postoperative care. Silent, thirty minutes.

HERBERT CONWAY, New York Hospital and Cornell University Medical College, New York:

Tattooing of Skin Grafts and Port Wine Stains: This film shows the technic of tattooing as a form of medical therapy for the coloration of skin grafts on the face, and the permanent camouflage of port wine stains (capillary hemangiomas) by pigment injections. The technic of administration and appearance of patients before and after the treatment is demonstrated. Silent, twelve minutes.

H. R. REICHMAN and SCOTT SMITH, Salt Lake City:

Sigmoidotomy for Removal of Pedunculated Adenoma: The film shows the importance of adenomas of the colon. When roentgen studies of the colon are negative diagnosis is made by the proctoscope. Spinal anesthetic with supplement is used in a 9 year old boy. Silent, seventeen minutes.

LEES M. SCHADEL JR., Hahnemann Medical College and Hospital, Philadelphia:

Meperidine and Pudendal Block: Obstetric analgesia is obtained with meperidine and scopolamine in a primigravida. For anesthesia a new technic of perineal block is illustrated by a review of the nerve supply to the perineum and the landmarks referable to this block technic and also by a close-up showing the technic to be followed and a demonstration of its effect in producing complete perineal anesthesia. The episiotomy and delivery show spontaneous breathing of an infant without any signs of depression. Inspection of the cervix and repair are shown, and the area is retested for complete anesthesia. Silent, fifteen minutes.

WILLIS J. POTTS, SIDNEY SMITH and WILLIAM O. McQUISTON, Children's Memorial Hospital, Chicago:

Aortic Pulmonary Anastomosis for Congenital Pulmonary Stenosis: The surgical treatment of pulmonary stenosis is presented, and the technic of aortic pulmonary anastomosis, or the Potts-Smith operation, is shown in detail. By use of animation the exact technic of suture of the aorta to a pulmonary artery is shown. Silent, thirty-six minutes.

GEORGE L. WESSELS and ROBERT L. PATTERSON, Allegheny General Hospital, Pittsburgh:

Modern Trends in Intravenous Therapy: The film presents a simplified technic for administering large volume intravenous fluids with both conventional and disposable equipment. Technics for blood transfusion, blood banking and preparation of plasma are also shown. Silent, thirty-seven minutes.

R. P. WALTON and O. J. BRODIE, Medical College of South Carolina, Charleston, S. C.:

Effect of Drugs on the Heart in Situ: The mammalian heart, exposed in an open chest preparation with mechanical respiration, is shown during the response to administration of typical cardiovascular drugs. Simultaneous recordings with blood pressure manometer and electrocardiographic tracings are shown synchronously in slow motion. The effects of autonomic drugs, of anoxia and of various degrees of digitalis intoxication are shown. Protection of the ventricle against electrically induced auricular fibrillation and increased myocardial contractile force as produced by digitalis are demonstrated. Silent, twenty-eight minutes.

CARROLL L. BIRCH and LOUIS R. LIMARZI, University of Illinois College of Medicine, Chicago:

Animated Hematology--Bone Marrow: The picture shows general considerations of normal bone marrow, its embryology and development, technic of bone marrow study and pathology of bone marrow (anemias, leukemias, Gaucher's disease, multiple myeloma, leishmaniasis, malaria, etc.). Bone marrow is shown by "kodachrome" photomicrographs. Silent, fifty minutes.

FRANKLIN F. SNYDER, Boston Lying-In Hospital Boston:

Breathing Before Birth and Its Obstetric Significance: The picture demonstrates that babies breathe before birth as shown by the rhythmic movements transmitted through the abdominal wall of the mother. They breathe the amniotic fluid in which they are immersed, thus preparing the lungs for the first gasp of air following delivery. Intrauterine pneumonia results from breathing contaminated amniotic fluid, such as follows premature rupture of the membranes. The introduction of carbon particles into the amniotic fluid in a rabbit is shown and the black lungs of the fetus a few minutes later are striking. The placental circulation is shown, and it is evident that fetal activity is not due to asphyxia, but is associated with highly oxygenated (bright red) blood. Analgesic drugs given to the mother can be compared with respect to the amount and duration of their depressant effects on the fetus independent of the complications of labor. Silent, forty minutes.

H. L. SMITH, H. E. ESSEX and E. J. BALDES, Mayo Clinic, Rochester, Minn.:

A Study of the Movement of Heart Valves of Various Laboratory Animals: The hearts of various laboratory animals were perfused and kept beating for various lengths of time. Openings were made in the different chambers of the hearts, and motion pictures were made of the exact movements of the mitral, tricuspid, aortic and pulmonic valves. Silent, twenty-three minutes.

FREDERICK F. TISDALL, University of Toronto and Hospital for Sick Children, Toronto, Canada:

Ascorbic Acid and Scurvy: This motion picture is a clinical lecture on ascorbic acid and its use in the prevention and treatment of scurvy. There are some references to the part that ascorbic acid plays in the general metabolism of the body and in other clinical conditions encountered. Sound, twenty-five minutes.

SOMERS H. STURGIS and JOHN ROCK, Massachusetts General Hospital and Free Hospital for Women, Boston, and Brookline, Mass:

The Physiology of Normal Menstruation: The picture shows by diagrammatic animation the production of pituitary and ovarian hormones, the response of the ovaries to pituitary stimulation and the response of the endometrium to ovarian stimulation. The coordinated activity of pituitary, ovaries and endometrium is summarized. Use of photomicrographs of the endometrium in various phases demonstrates actual histologic changes. Sound, twenty-two minutes.

A. E. GOLDSTEIN, Sinai Hospital and University of Maryland, Baltimore:

Surgery for Polycystic Renal Disease: This surgical procedure was suggested by the author twelve years ago. Each kidney is exposed separately. All available cysts are opened and drained. The kidney is then split in half lengthwise, down to the calyces and each half is sutured to the skin for future puncturing. While this is not a cure; symptoms have been relieved and life has been prolonged in many cases. Silent, fourteen minutes.

D. C. HINES, Lilly Laboratory for Clinical Research, Indianapolis, Ind., and A. C. Corcoran and I. H. PAGE, Cleveland Clinic, Cleveland:

Kidney Function in Health: The film begins with a brief characterization of the role of the kidneys and the general principles of their function. It then follows the course of the blood to a glomerulus and describes the factors governing filtration and the various renal function tests concerned with filtration. The filtrate is then followed step by step through the renal tubule, the actions of the various sections being illustrated as they are reached. Sound, thirty-eight and one-half minutes.

SPECIAL EXHIBIT COMMITTEE ON PHYSICAL MEDICINE: The following motion pictures are presented in conjunction with the Special Exhibit on Physical Medicine:

Toward Independence. United States Army film. Sound, thirty minutes.

Physical Medicine Service. United States Army film. Fifteen minutes.

Return to Action. United States Army film. Nineteen minutes.

Dynamic Physical Reconditioning. United States Army film. Thirteen minutes.

First Steps. United Nations Film. Ten minutes.

UNITED STATES ARMY, Medical Department, Washington, D. C.:

Aneurysms, Part I - Quadruple Ligation and Excision of Arteriovenous Fistula of the Femoral Vessels, Lower Third: The motion picture presents the preoperative findings, surgical procedure, and postoperative picture of an interesting and important vascular injury, which in this case resulted from a shell fragment wound. It covers the subject in detail and emphasizes the precautions that must be taken during surgery. Sound, ten minutes.

Arteriovenous Fistula with False Sac of Lower Femoral Vessels (Quadruple Ligation and Excision): Essential phases of a preoperative examination for this type of injury are portrayed and the details of surgery, to include fistula and false sac removal, are clearly shown and described. Sound, fifteen minutes.

Management of Abdominal Colostomies (Intraperitoneal Closures): Pertinent factors associated with the management of transverse, left side, and sigmoid colostomies, including intraperitoneal closure technics are shown. As presented, a comparison of the problems confronting the operator can be seen readily. Sound, twenty-four minutes.

Management and Technic of Pulmonary Lobectomy: A complete presentation of the subject, including preoperative program, surgical procedure, bronchoscopic and radiographic phases, postoperative program, and measures taken to effect an active convalescence. Sound, twenty-seven minutes.

The TECHNICAL Exposition

The popularity and importance of the Technical Exposition to the medical profession will again be demonstrated not only by the increased number of exhibitors but in the quality of the exhibits themselves. It will be a fitting testimonial to the faith and vision of the manufacturers and the profession which they serve.

In 600 units of space, stretched over the vast expanse of the upper deck of the Navy Pier, jutting out into Lake Michigan, six long rows of fine displays will show the technical skill and manufacturing genius brought to the 1948 Session. The arrangement is such that any one exhibit may be readily located.

In attractive, brief form, the exhibits will reveal the physicians' modern armamentarium for his combat with disease. Here the physician can leaf through or examine leisurely almost the entire line of foremost and latest medical books. He can pick up and admire fine precision instruments; see demonstrations of highly specialized apparatus; gain first-hand information concerning the newer discoveries in antihistaminic, antibiotic, amino acid, and hormonal therapy; learn latest facts about the newer methods of diagnosing cancer, the therapeutic effects of foods and their relation to health. The same applies to special apparel, infant items, hypo-allergenic cosmetics, specialized services, and other time-honored standbys that fill an important place in the physician's scheme of things. If the venerable " horse and buggy " doctor of long ago could visit the 1948 Annual Technical Exposition, no doubt he would remark: " What a rich legacy of new and better methods the present-day physician is heir to! What a long way we have come "!
